With a mixture of Phocian troops and foreign mercenaries, Philomelus seized the sanctuary at Delphi in 356, killing his opponents and erasing the offensive Amphictyonic decrees. Defeating an immediate attack from the nearby western Locrians, he promised to protect and not to plunder the sanctuary. Expecting more attacks, he increased his forces to 5,000 men and fortified the sanctuary. Philomelus' public relations campaign did not convince the Boeotians and Locrians, who built a coalition to end the Phocian occupation. The groups which joined the anti-Phocian alliance were the Thessalians, Perrhaebians, Magnesians, Achaeans of Phthiotis, and a number of smaller groups in central and northern Greece. Athens and Sparta supported the Phocians, but did not provide soldiers at this stage. Faced with such a broad coalition, Philomelus hired a large mercenary army, possibly with money plundered from the sanctuary.

The war now began in earnest. Acting quickly before his opponents could join forces, in 354 Philomelus took a large army over the hills into

eastern Locris. There he defeated the combined Locrian and Boeotian cavalry, then defeated the Thessalians when they arrived, but refused battle with the Boeotian infantry, the best in Greece, when they came on the scene. Both sides killed prisoners, the allies because the Phocians were temple-robbers, the Phocians in reprisal. Philomelus retired to defend the Phocian heartland in the Cephissus valley, and was forced into battle near Neon (Tithorea). The Phocian forces were defeated by the allied forces led by the Theban Pammenes, and many fled up the slopes of Mount Parnassus. Philomelus himself, trapped by his pursuers, threw himself off a cliff. Thinking the war was over, the allies went home.

Many moderate Phocians wanted to end the war, but Onomarchus, Philomelus' colleague as general, fearing for his own position in any peace settlement, convinced the majority to pursue the conflict and give him supreme command. Plundering large quantities of the riches stored up at Delphi, he hired more mercenaries, bribed enemies, and with forces totaling over 20,000 briefly made Phocis the great power of central Greece. In 353 he took the war aggressively to the enemy, enslaving the inhabitants of Thronium in eastern Locris, sacking the small towns of Doris in central Greece, forcing Amphissa into submission, and invading Boeotia itself, where he captured Orchomenus. By giving support to Lycophron and Peitholaus, the tyrants of Pherae, he ensured that Thessaly was divided and would not for the moment take further part in the war.

But trouble loomed. The Thessalian opponents of Pherae called for help from their ally, Philip II of Macedon. Philip entered Thessaly and defeated a Phocian army of 7,000 under Onomarchus' brother, Phayllus. Onomarchus then marched in full force into Thessaly and defeated Philip in two battles; Philip withdrew, but rather than consolidating his position in Thessaly Onomarchus attacked the Thebans, using passes over Mount Helicon to threaten the whole of western Boeotia. Philip was not done, however, and in 352 returned with a larger army. The result was a comprehensive victory for Philip at the battle of Crocus Field and the death of Onomarchus. According to Diodorus, Philip executed the captives by throwing them into the sea as punishment for robbing the sanctuary: an illustration, if true, of the importance of religious propaganda in the war. Philip advanced to Thermopylae, but found an Athenian force defending it and went home.

Phayllus now took command of the Phocians, and hired yet more mercenaries, paying twice the going rate out of the "inexhaustible supply of

money” from Delphi (Diodorus 16.37.2, indicative of the vast wealth of a major Greek sanctuary). Athens, Sparta, Achaea, and the deposed tyrants of Pherae—all fearful of the Theban–Macedonian axis—now provided troops. Phayllus once again took the initiative and invaded Boeotia, but he was no match for the generals who preceded him. The Thebans defeated him three times before he could extract his forces. Phayllus now adopted more moderate ambitions, securing the coastal route through eastern Locris and the passes over the hills into Phocis, and using the routes over Mount Helicon to harry the Boeotians. The Thebans had no answer, and the war drifted toward stalemate.

The key to unlocking the impasse was Philip. By 346 all the parties were exhausted, and the Phocians were running out of Delphic treasure. Phayllus had died, and Phalaecus, the young son of Onomarchus, was commander. Philip was now master of Thessaly, and could not ignore the Thessalian desire to regain their primacy at Delphi. For some time Philip was busy in the north, but by 346 was ready to act. The Peace of Philocrates ensured that he could do so without Athenian opposition. Athens abandoned the Phocians. So did Phalaecus: he struck a deal with Philip to allow him and his mercenaries to escape. Phalaecus took his 8,000 remaining men to the Peloponnese, leaving Phocis undefended. Philip ended the Sacred War without fighting a battle.

Consequences

As punishment for the 10 years of war, the Phocians had their cities broken up into villages, were barred from having horses or arms, and had to pay enormous reparations, initially set at 60 talents per year, reduced after Philip’s death to a more manageable 10 talents per year. The Phocians were also expelled from the Amphictyony, and their votes given to Philip. In this way Philip ensconced himself in the affairs of southern Greece, a situation that indirectly led a few years later to the Fourth Sacred War and the battle of Chaeronea.

Sacred War, Fourth (340–338)

Causes

The Fourth Sacred War probably began as a boundary dispute between Delphi and the western Locrian town of Amphissa, together perhaps with disputes between various parties in both Amphissa and Delphi. At a meeting of the Delphic Amphictyony in autumn 340, the Athenian orator Aeschines accused the Amphissians of cultivating Delphic territory sacred to Apollo. The Amphissians drove off an Amphictyonic tour of inspection, and a few months later the Amphictyony decided to punish them.

Course

The Amphictyony (though with both Athens and Thebes boycotting proceedings) gathered an army at Thermopylae, commanded by one of the Thessalian representatives on the Council, Cottyphus, and marched south to Amphissa. The Amphissians seem to have submitted without a fight, and agreed to pay a fine and restore a group of exiles. However, the Amphissians later reneged on the agreement, and in 339 the frustrated Amphictyons called on the assistance of Philip II of Macedon to settle this conflict, as he had the Third Sacred War eight years before. Until this point Philip had been busy campaigning in the north, and there is no reason to believe that he had any hand in fomenting the war. It now suited his purposes, however, to march south, secure the Thermopylae area, and then take his army over the hills to central Greek Doris, at the head of the Cephissus valley. But instead of marching further south to Amphissa, he turned east and occupied the eastern Phocian town of Elatea. Athens, long Philip’s enemy, and Thebes, his nominal ally, now joined forces and defended both the pass north of Amphissa and the route down the Cephissus

into Boeotia. Philip tricked the defenders of the former and his general Parmenion ended Amphissian resistance, thus ending the Sacred War proper. Some months later, in mid-338, Philip fought and defeated the combined Theban and Athenian forces at Chaeronea.

Consequences

By giving Philip opportunity and pretext to march into central Greece, this trivial war was the trigger for Macedonian hegemony over Greece as a whole.

Salamis, Battle of (480)

Salamis, an island off Athens, was the site of the decisive naval battle of the Second Persian War. After the Greek land defeat at Thermopylae forced the withdrawal of the accompanying fleet from Artemisium (480), the Greek fleet occupied Salamis.

Although it is difficult to recover the numbers of the combatants, it is clear that the Greeks were outnumbered. Reinforced after Artemisium, the Greek fleet had 378 triremes (310 according to Aeschylus) and some of the older penteconters. Herodotus (7.89) gives the total number of Persian triremes at the start of the expedition as 1207 (a number which he took from Aeschylus, *Persians* 341). Despite his later statement (8.66) that the losses in men (and presumably ships) at Artemisium and elsewhere had been replaced, this seems highly unlikely as his figures record a minimum of 645 losses (excluding those on the final day at Artemisium). Given that the original figure of 1207 was probably exaggerated, a reasonable estimate (although still conjecture) would be that the Persians mustered perhaps a

maximum of 500 triremes at Salamis.

The accounts of the course of the battle are heavily influenced by the postbattle interests of the participating states, and contain the usual contradictions. The main thread, though, is that Eurybiades, the Spartan commander, and the Peloponnesians wanted to withdraw. In a last ditch effort to prevent this, Themistocles sent a messenger to Xerxes telling him that the Greeks planned to withdraw that night. Xerxes' response was to send a squadron around behind the Greeks to block their departure to the west; he also occupied the island of Psyttaleia with troops. The main Persian fleet at Phalerum was already blocking any attempt to leave in an easterly direction. Whatever the truth of Themistocles' ruse, the Greeks fought Salamis in waters to their advantage (unlike the Isthmus) and against a tired enemy who had spent all night at battle stations.

The main Persian fleet advanced from the east, perhaps under cover of darkness, and to take up a position with their sterns to the Attic coast and facing the Greek fleet opposite. As day broke and the battle began, they apparently lost formation as the channel narrowed. Using local experience, the Greeks waited to attack until the daily swell in the channel occurred and the Persian ships were disrupted by it. The net effect of the swell and narrowing was that the Persian ships were crowded together and the contingents were already in some confusion when the Greek assault exacerbated this. The Persians were routed with heavy casualties (increased by the fact that few of them could swim) and the troops on Psyttaleia were slaughtered.

Herodotus does not record the casualties but Diodorus Siculus (11.15) has 200 Persian ships and 40 Greek. The difference between them is probably exaggerated, but the Persian losses were sufficiently heavy to cause Xerxes to withdraw the fleet and to return home with a large part of the army. The battle gave the Greeks naval superiority, ended the Persian naval threat to mainland Greece, and paved the way for the final victories at Plataea and Mycale.

Salamis, Battle of (306)

When Antigonus I Monophthalmus attempted to conquer Greece, he sent his son Demetrius I Poliorcetes to lead an invasion from Ephesus against Athens. As a result, Ptolemy I Soter, the king of Egypt, under the pretext that Antigonus disregarded the freedom of the Greek *poleis*, ventured to conquer Cilicia. Shortly afterward, in 306, the conflict between Antigonus and Ptolemy culminated in the naval battle of Salamis, one of the most critical battles between Alexander’s Successors (*diadochoi*). The battle was off Salamis in Cyprus and between fleets led by Demetrius I Poliorcetes, and Menelaus, the brother of Ptolemy I Soter. Menelaus was utterly defeated. For the first time, in this battle, Demetrius introduced an effective new type of large ship—the “seven” (*hepteres*). Demetrius had the advantage of choosing the site for the battle. He therefore more quickly reached the harbor of Salamis, where he divided his ships in two lines, and kept 10 of his ships in the mouth of the harbor; at some point in the battle these were sent to where the land army was encamped.

Ptolemy’s losses were major. The forces of Demetrius captured 40 warships, as well as 100 supply ships with more than 8,000 infantrymen. Afterward, Ptolemy abandoned Salamis. He had lost almost half of his military force, around 16,000 infantrymen and 600 cavalry, as well as half of his transport ships. After the battle, for 12 successive years (306–295/4), the island of Salamis was under the control of Demetrius. After his victory, his father Antigonus was the first of the *diadochoi* to grant himself the title of king (*basileus*), while Demetrius became his coruler. Despite their victory, Antigonus and Demetrius achieved less success in the following years.

Samos

An island located in the eastern Aegean Sea off the Turkish coast. Samos is most famous for its monumental temple to Hera, the Heraion, first constructed during the Archaic Period, sometime in the eighth century. Samos has arable slopes and coastal plains despite the mountainous north and western regions of the island. The *polis* of the same name is located on the east of the island, near the coast. The earliest inhabitants are thought to have been Carian. In the tenth century, Ionian colonies were established on the island, mixing the population. Samians colonized in the regions of Cilicia, Propontis, and the Euxine Sea. They also helped found Cyrene (in Libya) and built a temple at Naucratis. In his description and account of Samian history, Herodotus focuses on Polycrates' tyranny and three edifices created by the Samians: the harbor mole, the tunnel of Eupalinus, and the Heraion (temple of Hera).

Major exports of Samos included oil and earth (used for fulling cloth) in Samian transportation amphorae. Samos established trade relations with Egypt, Phoenicia, and the Laconians in the late eighth and early seventh centuries. Euboean and Attic pottery, bronze figures from Caucasus, North Syrian scaraboid seals, and Assyrian cylinder seals began to appear on the island during the eighth century. The Heraion is one of the earliest known Greek stone temples of monumental size and has been credited to the architects Theodorus and Rhoecus. Samos is also known for its ancient fortified city of Pythagoreion.

The earliest established government was an oligarchy comprised of the local *Geomoroi* (land-sharers), likely landowning aristocrats. In the seventh and sixth centuries, Samos was ruled by a tyranny, established by Syloson I. The most famous of these tyrants was Polycrates, who is considered responsible for Samos' naval domination of its neighbors, mostly through piracy—as well as its great architectural achievements. Under Polycrates Samos saw the rise of several gifted intellectuals, such as the physician Democedes and the architect Rhoecus. Pythagoras, renowned mathematician and philosopher, fled Polycrates' tyranny in the 530s. Samos also was home to Aesop, Epicurus, and Duris. During the reign of Cambyses of Persia (530–522), Polycrates was condemned by the Egyptians and the Peloponnesians for his pro-Persian policies which seemed to tempt fate. Sparta invaded Samos in the 520s to remove Polycrates from power. Polycrates was killed by Oroetus, the Persian governor of Sardis, in 522, and was succeeded by his brother Syloson II. Tyranny in Samos came to an end with the establishment of a radical democracy under the Athenians' influence in the fifth century.

Samos was involved in several wars during the Archaic Period, including the Lelantine War in Euboea, and the Meliac War. Further, it played a crucial role in supporting the Ionian Revolt against Persian domination in Asia Minor until the defeat at Lade in 494. Later the Samians joined the Delian League, contributing ships as tribute against Persia until their revolt against Athens in 440. Samos' war with Miletus in 440 resulted in Athens' replacing the Samian oligarchy with a democracy and installing an Athenian garrison. The oligarchs returned with Persian support, leading to a full naval assault directed by Pericles himself. The Samians appealed to Sparta for further support, but Thucydides (1.40) claims that Corinth persuaded the Peloponnesian League not to intervene. The Samian War lasted nine months and resulted in the subjugation of Samos and an indemnity of 50 talents per annum. During the Second Peloponnesian War, Samos sided against Sparta with Athens, contributing ships to the war effort. In 411 when the Athenian democrats were expelled, Samos gave them a temporary home. Afterward, Samos was besieged by the Spartans under Lysander. The Spartans withdrew from Samos in 394, leading to the reestablishment of a democracy. Samos lost its independence in the Peace of Antalcidas (387/6), which declared it part of the Persian Empire. Samos was restored to the Athenians by an 11-month siege in 366–365, resulting in an

Athenian cleruchy in Samos. The entire population was allegedly expelled and replaced with Athenian cleruchs to use Samos as a military base for the Athenians, as proved useful during the Social War of 357–355. The Lamian War of 322 saw Samos restored to independence.

Alexander III of Macedon used Samos as a base against Persia during his military campaigns. Alexander's exiles decree allegedly liberated the Samians, despite its concurrent occupation by Macedonians. Possession of Samos was disputed among Alexander's Successors (*diadochoi*) until 281, when the Ptolemaic forces prevailed. After Philip V of Macedon's attacks in 189, Samos became a part of the Rhodian hegemony, a league sanctioned by the Romans. Samos was bequeathed to Rome as part of the province of Asia Minor in 133. Under the Romans, Samos flourished and was best known for its pottery and as a health resort.

Samos, Siege of (440–439)

In 441/40, Samos and Miletus went to war over possession of Priene. Both were members of the Delian League and Miletus appealed to Athens for aid—supported by a group of Samians who wanted to remove the oligarchic government there. Perhaps as part of their general policy of weakening the major states in the Delian League, the Athenians quickly sent out 40 ships, replaced the Samian oligarchy with a democracy, took 50 young male hostages and left. Some Samians, presumably oligarchs, fled to the mainland and persuaded the Persian satrap Pissuthnes to restore them. With 700 of Pissuthnes' men they took the city by surprise, freed the hostages (who had

been left on Lemnos) and revolted from Athens.

This was a serious development for Athens and its control of the Delian League, especially as Byzantium, another important member, also revolted. Because of this, the Athenians reacted decisively. In 440, 60 ships were sent out under Pericles himself. Sixteen of these were detached to get reinforcements from Chios and Lesbos and scout for the Persian navy, the remainder defeated a 70-strong Samian fleet (which included 20 transports). When 40 more ships arrived from Athenians and 25 from Chios and Lesbos, Pericles landed his troops, defeated the Samian army, and besieged the city. Three walls surrounded it on land and the fleet blockaded the harbor. However, when Pericles detached 60 ships to meet a Persian fleet advancing toward the island the Samians broke through the remaining ships blockading them and for 14 days were able to bring in supplies unhindered. Pericles' return, and the arrival of another 60 Athenian ships and 30 from Chios, rapidly restored the situation and after nine months Samos surrendered. It was reduced to subject status, surrendering its war fleet, demolishing its walls, giving hostages, and paying a large indemnity in installments. Byzantium also surrendered.

This incident is fairly typical of revolts against the Delian League, with a medium power trying to break free, a quick Athenian military response, and surrender. In most cases the revolting state, like Samos in this case, lost autonomy and military power, which was diverted to Athens. The net effect was to transform the Delian League over time into the Athenian Empire. The Samian siege is notable for the involvement of Pericles, the leading Athenian politician of the period, and demonstrates the requirement for such leaders to combine political, civic, and military talents.

Scythia, Scythians

The Scythians were an Indo-European group from eastern Europe and Central Asia. They are generally believed to have been a nomadic people who moved across the Eurasian Steppes with their herds from season to season. In actuality the Scythians were a diverse group of people with a number of different tribes connected by a common language and social structure who were variously nomadic, semi-nomadic, or sedentary—either living in cities and towns, or as agriculturalists. The Greeks interacted primarily with the agrarian and urban Scythians through trade and cohabitation in the Greek colonies around the Black Sea.

The agrarian Scythians of the Black Sea region grew grain, which was exported to Greece. The Crimean Scythians traded slaves, cattle, and animal products in exchange for Greek pottery and art. The graves from these regions are rich in Greek-style burial goods as well as traditional Scythian pieces, indicative of the economic and cultural interchange between the Scythians and the Greeks. The number of Scythian inhabited cities increased during the third–second centuries, suggesting that several of the nomadic tribes were becoming increasingly more sedentary. The nomadic and seminomadic tribes were pastoralists who lived on the goods—meat, milk, and hides—produced by their animals.

Hunting was an essential part of Scythian society. The region was rich in wildlife and the importance of these animals to Scythian culture is reflected in their elaborate animal-style art, which depicts animals both real and mythical, and often in fantastical poses. The animals are often shown in combat with each other—symbolizing the warrior ethos of Scythian society—while more bucolic scenes emphasize the importance of animals to nomadic life.

The Scythians placed a great deal of emphasis on friendship, oaths, and hospitality, elements that are essential components of nomadic societies today. Herodotus (4.70) and Lucian (*Toxaris* or *On Friendship*, 37) both recount stories relating to friendship bonds that are also reflected in a pair of fourth-century plaques from Kul Oba and Solokha depicting two Scythian men drinking from the same *rhyton* in what must be a friendship

ceremony. A gold vessel from Kul Oba portrays the bond that must have developed between friends, both on campaign and in everyday life. In the first scene, one man is binding his partner's injured leg, while in the other a man appears to be pulling a tooth from his companion's mouth. The Kul Oba vessel shows, as do many other Scythian pieces, scenes of daily life in a nomadic warrior society.

A fourth-century gold plaque of a Scythian horseman brandishing a spear, found in a burial mound at Kul Oba in the Crimea. The plaque, typical of the rich art found in upper-class Scythian burials, reflects the centrality of horses in Scythian culture. Located in the State Hermitage Museum, St. Petersburg, Russia. (Werner Forman/Universal Images Group/Getty Images)

Much of what we know about the Scythians has come from their burials—particularly the elaborate kurgans of the elite. Herodotus (4.71–75) provides a lengthy account of Scythian burial practices, much of which correlates with archaeological finds. Some of the best examples of the Scythian kurgans are the fourth–third century Pazyryk burials from the Altai Mountains in southern Siberia, the contents of which were completely preserved by permafrost.

The quintessential Scythian weapon was the recurve composite bow, which they wielded with great skill from horseback. These bows were made of materials that allowed them to withstand repeated extremes of tension and compression, allowing them to be short, light, and powerful. The

composite bow was made of three parts: a central stave of wood (cornel, maple, or mulberry) laminated with horn on the belly and the sinew of cattle or deer on the back. The process of making the bow was exacting and labor intensive. If the various components were not set correctly, the whole weapon could fail and shatter during use.

The Scythian warrior also carried an *akinakes*—a short sword with a broad double-edged blade that tapered to a sharp point. The *akinakes* was well balanced for both slashing downward from horseback or stabbing/thrusting on foot.

For defensive equipment the Scythian wore lamellar scale armor made from overlapping leather, bronze, or iron plates stitched onto a leather backing. Lamellar was relatively lightweight and offered a good degree of mobility, which was advantageous to the mounted archer. They also carried a light, flexible shield—the *pelte*—made of narrow branches woven through leather into a variety of shapes, as can be seen on the Solokha comb. Horses appear to have worn little to no armor, being equipped only with a felt saddlecloth and bridle. Both human and equine equipment emphasize the importance of speed and mobility on the battlefield.

Seleucids

The Seleucids ruled an empire centered on Syria for most of the Hellenistic Period. The dynasty was named after its founder, Seleucus I Nicator (reigned

312–281), a general under Alexander the Great. From their base in Syria, the Seleucids ruled an empire consisting of the largest, eastern part of Alexander's conquests. At its largest extent, the Seleucid Empire stretched from the northern Levant and parts of Asia Minor in the west to the Indus River valley in the east.

In the settlement following Alexander's death, Seleucus was made commander of the Companion cavalry under the regent Perdiccas. After Perdiccas' death, Seleucus was put in charge of the satrapy of Babylon, but was soon driven out by Antigonus. He sought refuge at Ptolemy's court in Egypt, and in 312 was restored by Ptolemy to his satrapy. Thereafter, he expanded his kingdom to include nearly all of the former eastern empire of Alexander.

Seleucus was succeeded by his half-Bactrian son Antiochus I Soter (reigned 281–261, but coregent from 292). He defeated an invasion of Celts into Anatolia in 275. He also fought the First Syrian-Egyptian War against the Ptolemies over Coele-Syria.

Seleucus' son Antiochus II Theos (reigned 261–246) succeeded his father. During his reign, the Parthian and Bactrian satrapies broke away from Seleucid control, and the Second Syrian-Egyptian War was fought to a stalemate against Egypt. Peace was made in 253, and Antiochus married Ptolemy II's daughter Berenice, divorcing his first wife Laodice I. But in 246, the king left Berenice and reunited with Laodice, who then allegedly poisoned him. Laodice then had Berenice and her infant son Antiochus killed, and proclaimed her son Seleucus II Callinicus king. To avenge the murder of his sister and nephew, Ptolemy III launched the Third Syrian-Egyptian War, attacking the coast of Asia Minor and marching deep into the Seleucid realm, perhaps as far as Babylon. Civil war (the "War of the Brothers") then broke out between Seleucus and his brother Antiochus Hierax, and was intermittently fought for the next 20 years. Seleucus partially recovered his eastern empire, but lost Asia Minor to Hierax, and then to Attalus I, king of the breakaway kingdom of Pergamum.

Seleucus' son Seleucus III Ceraunus (also called Seleucus III Soter) succeeded in 225 but was assassinated in 223, allowing his brother, Antiochus III The Great (reigned 223–187), to take the throne. After reconquering his eastern empire and Asia Minor, and emerging victorious in the Fifth Syrian War over Ptolemy V (thus reversing the result of the Fourth Syrian War against Ptolemy IV), he lost the Syrian-Roman War, and

the Romans forced him to withdraw from Asia Minor beyond the Taurus Mountains and the River Halys. Antiochus was succeeded by his son Seleucus IV Philopator (reigned 187–175), who plundered the temple in Jerusalem, and was later assassinated by his minister Heliodorus. Seleucus' younger brother Antiochus IV Epiphanes (reigned 175–164) ejected Heliodorus and became king. He was victorious over Ptolemy VI in the Sixth Syrian War, and came within an ace of taking over Egypt itself, but the Romans ordered him to stand down in 168. Antiochus also sacked Jerusalem and persecuted the Jews, thus sparking the revolt of the Maccabees in 167.

Epiphanes' son Antiochus V Eupator (reigned 163–162) succeeded to the throne at nine years of age, even though his cousin, 22-year-old Demetrius I Soter, son of Seleucus IV, was capable of ruling. But Demetrius was in detention in Rome, where he had been living as a hostage since his father's reign. The Romans, being informed that Eupator was in breach of the Seleucid treaty with Rome, sent envoys to Syria to oversee the hamstringing of the king's elephants and the destruction of his ships.

Demetrius escaped Rome in 162, returned to Syria, and deposed his cousin. He recovered Babylonia and Cappadocia, and continued to persecute the Jews. He was deposed by a pretender, Alexander Balas (reigned 150–145), in 150. Balas, in turn, was deposed by Demetrius' son Demetrius II Nicator.

The later Seleucid monarchs exhausted themselves in dynastic quarrels and lost their grip on all but the Syrian heartland of their empire. Tigranes II the Great of Armenia took over the Seleucid Empire in 83, but was forced to surrender to the Roman general, Pompey the Great, in 66. Tigranes' Seleucid holdings were annexed into the new Roman province of Syria in 64/3.

Seleucus I Nikator (Reigned 312–281)

Macedonian officer of Alexander the Great and one of the Successors (*diadochoi*). After the death of Alexander, Seleucus was appointed commander of the Companion Cavalry by Perdiccas. In the wars that followed Alexander's death he at first centered his power on Babylon, from where he would establish the Seleucid Empire and the Seleucid dynasty.

Seleucus accompanied Perdiccas in his bid to oust Ptolemy from Egypt but appears to have turned on Perdiccas and might even have been one of Perdiccas' murderers. At the Triparadisus Conference ca. 321–320 Seleucus was given the satrapy of Babylonia. However, in 320 he was driven from Babylon by Antigonus I Monophthalmus. Seleucus sought sanctuary with Ptolemy and served under him as a naval commander.

Following the battle of Gaza in 312, which saw Ptolemy and Seleucus defeat Demetrius I Poliorcetes, Seleucus regained Babylon with Ptolemy's support. Seleucus went on to conquer Media and Persia and extended his conquests toward India. In 305, following the example of the other *diadochoi*, he assumed the title of king and as a result of a settlement with the Mauryan king Chandragupta (Sandrokottos or Androcottus in Greek and Latin texts), Seleucus received 500 war elephants in exchange for ceding provinces in the east. This large force of 500 elephants would prove decisive when Seleucus, and his allies Cassander and Lysimachus, defeated Antigonus I and Demetrius I at the battle of Ipsus in 301. Antigonus was killed and Demetrius, isolated from his father's main force, was forced to flee.

After the battle of Ipsus, the victors divided up the Antigonid territorial

possessions between them, with Seleucus receiving Syria. However, Ptolemy I Soter, who had taken no part in the war against Antigonus, had occupied the southern part of Syria, Coele Syria. Seleucus, who had been aided by Ptolemy in the past took no military action against him, but moved his capital from Seleucia on the Tigris and established his new capital at the recently founded city of Antioch on the Orontes. At the same time Seleucus founded three other cities in northwestern Syria: Seleucia in Pieria, Apamea, and Laodicea. This strategic move would halt any further northern expansion by Ptolemy, and these four cities were to be the core of the future Seleucid Empire.

In 292, Seleucus made his son Antiochus satrap of Bactria and his co-regent. In 285 Seleucus took Demetrius I Poliorcetes prisoner and imprisoned him in Apamea. In 281 Seleucus intervened in Lysimachus' affairs, the latter having had his son assassinated and, at the battle of Corupedium, Seleucus was victorious and Lysimachus fell in the fighting. Lysimachus' territory now fell into Seleucus' possession but he was murdered by Ptolemy Ceraunus, a fugitive at his court, the same year. Seleucus was succeeded by his son Antiochus I.

The most western Greek colony in Sicily, Selinus was founded ca. 650 in the territory of the indigenous Elymians, with Phoenician (later Carthaginian controlled) colonies nearby. It was often in conflict with its Elymian neighbors. In 409 Carthage attacked its former ally and Selinus fell into Punic hands, never regaining its former glory.

Selinus was prosperous during the sixth century due to its surplus grain and its good relations with the Phoenicians and Carthaginians. It expanded its territory with the foundation of Heraclea Minoa (ca. 570) in the east, pressed its border inland toward the Elymian city of Segesta, and west toward Mazara del Vallo.

Selinus' territorial expansion caused quarrels with its Elymian neighbors. During a boundary dispute in 416 between Selinus and Segesta the Elymians requested help from Athens. This led to Athenian involvement in Sicily (415–413). After the Athenian defeat, when Selinus attacked Segestan territory again in 410 the Segestans turned to Carthage for assistance. Carthage attacked Selinus in 409 and the city fell after a nine-day siege, with 16,000 Selinuntines killed and 5,000 taken captive.

The Carthaginians allowed the survivors to return to the city, which now paid a tribute to Carthage. A few years after the 409 fall, an attempt to free Selinus from Punic control was made by Hermocrates, a Syracusan general. This endeavor failed and the city remained in Punic hands until 250 when it was abandoned by Carthage and the population was relocated to Lilybaeum.

Sellasia, Battle of (222)

In summer 222, the king of Macedon Antigonus III Doson and the Achaean League fought the army of Cleomenes III, king of Sparta, at a battle near the perioecic village of Sellasia in Laconia. The Spartan army consisted of the 700 Spartiates already in existence, and probably included some of the 6,000 Helots who had recently been given freedom and some of the 4,000 *Perioikoi* recently made into Spartiates. Plutarch states “all the Lacedaemonians died, 6,000, except 200” (Plutarch, *Cleomenes* 28). Plutarch may have deliberately used the term “Lacedaemonians” to indicate that not everyone considered all these persons Spartiates, although they had officially entered the ranks.

Sparta’s defeat was particularly unlucky—Antigonus was called north two days later to defend Macedon from a Celtic army. Without his Macedonians, the Achaean League would have remained on its own at Sellasia and Cleomenes might well have defeated them. Further, a subsidy that Ptolemy had been paying Cleomenes was retracted shortly before the battle, reducing the Spartan ability to pay mercenaries.

Antigonus Doson followed up on his victory by capturing Sparta, installing a Theban governor, and possibly forcing Sparta to enter the Hellenic League that he had reconstituted in 224 from Philip II’s era. Sparta lost territory and Doson interfered in Sparta’s government, rolling back Cleomenes’ recent reforms.

Sepeia, Battle of (ca. 494)

The battle of Sepeia was important because it allowed Sparta to reestablish control of the Peloponnese by preemptively subduing a traditional rival, Argos. A large Spartan army under King Cleomenes I (reigned ca. 520–ca. 490) met 6,000 Argives at Sepeia, southeast of Argos on the road to Tiryns. There, either through a truce or Argive hesitancy stemming from an unfavorable omen, the two armies camped close to each other but did not engage. Herodotus, who provides the main account, says that the Argives matched the Spartan routine, retiring for meals only when the Spartan herald gave the order to eat. The Spartans attacked when Cleomenes caught wind of this, staged a deceptive order for breakfast, and attacked while the Argives were eating their meal. However, Plutarch says that Cleomenes used the language in the temporary truce to attack in the evening, using the pretense that the truce was only valid during the day, not at night. Either way the Argives were tricked, and the Spartans staged a massacre with tremendous loss of life. The survivors escaped to a sacred grove of Argos where they were trapped by the Spartans. Cleomenes called out the names of soldiers, pretending they had been ransomed, but killed them when they emerged. When those in the wood got wind of this and stayed put, Cleomenes gave the order to surround and burn the sacred grove, completing the slaughter of 6,000 Argive soldiers.

Sestos

Sestos was a strongly fortified city on the Hellespont coast of the Thracian Chersonese. The town had a good harbor, though this seems to have silted

up by late antiquity, and access to excellent farmland across the width of the peninsula; Long Walls connected the city with the harbor. Sitting at the narrowest part of the Hellespont, it was also the European end of the main crossing point, between Sestos and Abydos. First colonized by inhabitants of Lesbos, probably in the seventh century, in the later sixth century it may have been part of Miltiades I's fiefdom, before falling under Persian rule. During the Persian Wars, Sestos was the seat of the Persian governor, Artaÿctes, who was cruelly executed for alleged sacrilege when the Athenians under Xanthippus besieged and captured the town in 479/8.

Thereafter Sestos was part of the Delian League, and in the later parts of the Second Peloponnesian War, especially after 411, was an important Athenian naval base on the Hellespont. It was occupied by Lysander at the end of the war, and remained under Spartan control until captured by Conon in 393. It was then variously under Persian, Athenian and Thracian control, but suffered its greatest disaster in 353/2 when the Athenian general, Chares, captured it and subjected it to *andrapodismos* by executing all the adult males and selling the women and children into slavery. The city and its territory were important to the Athenians as a source of grain: one orator referred to Sestos as the "baker's board of the Piraeus" (Aristotle, *Rhetoric* 1411a). In the Hellenistic Period, Sestos shared the fate of the rest of the Chersonese, being fought over by Macedon, Syria, Egypt, and Pergamum, before becoming a free city under the Romans.

Seuthes (ca. 430–ca. 383)

Officially Seuthes II, this Thracian leader ruled the southeast portion of the Odrysian kingdom during the period ca. 405–383. United for much of the second half of the fifth century under the rulers Sitalces and Seuthes I, the Odrysian Kingdom showed signs of fragmentation at the end of the century. Seuthes' kinsman, Amadocus, was hailed as the legitimate heir to Seuthes I and became king at some point in the last decade of the fifth century. Seuthes II asserted his own right to rule: he rebelled against Amadocus, and tried to establish his own independent kingdom with the help of the Athenian Xenophon and the remnants of the Ten Thousand on their return from Cunaxa in 400–399. Xenophon and Seuthes managed to combine the cavalry and light-armed peltasts of the Thracians with heavy-armed Greek hoplites into a versatile combined-arms force that enjoyed a measure of success against his enemies. Xenophon's description in the *Anabasis* of life at Seuthes' court is the fullest surviving account of the customs and practices of Thracian rulers. Seuthes and his rival Amadocus were reconciled in 390/89 by the Athenian general Thrasybulus, and both entered into an alliance with Athens. Another Athenian general, Iphicrates, offered his military services to Seuthes in 386, possibly as a private individual rather than an official Athenian agent, and continued to serve Seuthes' successor, Cotys.

Ships, Transport

Transport and merchant vessels were known as “round ships” to the Greeks due to their rounder dimensions, as opposed to warships—“long ships.” There were many different specific types of transport ships: powered by oars, sails, or often both.

Unlike warships, merchant vessels have been found on the ocean floor and excavated archaeologically. In addition to pictorial representations and written sources, this allows a better understanding of the ships’ designs and cargo-carrying capacities than we have of warships.

With more room and less crew than warships, merchant ships could sail for longer periods of time without needing to go ashore. Although the ship’s crew in wartime would have had access to some weapons, transports were still extremely vulnerable to attacks by warships and required protection. In 429 a force of Peloponnesian ships carrying troops was defeated by half as many Athenian warships, whose speed allowed them to avoid being boarded by the superior number of troops in the Peloponnesian ships (Document 8). Certainly in the fourth century, when Athens was reliant on overseas grain imports, transport ships were placed into convoys for protection.

Transports were used to carry three basic cargoes essential to military operations: men, horses, and food. In the late fourth and the third centuries, as siege warfare became more complex, ships were often used to carry heavy siege equipment; for example, at Halicarnassus in 334 Alexander used Athenian ships to transport his heavy equipment. Transport ships could carry more cargo and at greater speed than was possible if going by land. An expeditionary force without transport ships was reliant on obtaining supplies from the local populace and was vulnerable. The Athenian forces at Aegospotami in 405 were forced to forage for food, leaving them open to the surprise Spartan attack that annihilated them.

The Persian force that invaded Greece in 480 was accompanied by a large naval force which, aside from the warships, included light boats and horse transports. Thucydides is more specific in listing the forces sent on the Sicilian expedition in 415, which included 40 transports carrying over 6,000 troops, one horse transport carrying 30 horses, and 30 transport ships carrying supplies. These 30 supply ships carried grain, bakers, stonemasons, carpenters, and the equipment needed to build fortifications. When Ptolemy

I Soter sailed to Salamis in Cyprus in 306 he required 200 transport ships to carry over 10,000 foot soldiers.

Finally, rather than using purpose built transport ships, warships could be converted to carry troops or horses. The 40 aforementioned troop transports sent on the Sicilian expedition were actually triremes fitted out to carry troops rather than equipped as warships. While a workable solution for carrying personnel and horses, warships were still ill-suited to carrying bulk cargo like grain and dedicated transport ships remained a necessity.

Ships, War

Warships evolved slowly over several hundred years, growing in size and in combat power over time. Warships gradually went from small vessels crewed by 40 men to behemoths carrying hundreds of rowers and scores of archers and marines, as well as artillery. The possession of a fleet of warships, even a small number, was a capital-intensive undertaking in terms of both money and manpower.

Warships were fitted with sails and with oars, although large warships such as the trireme were always rowed during battle. The ship's sailing equipment was usually left ashore before a battle to free up space and lighten the ship. This was not always possible, and in some cases the sailing equipment might be kept aboard if it was thought the ship might need to flee or would be unable to find a safe landing spot close by. The main modes of attack were either by boarding, or as ship technology developed and as regular training became more common, ramming attacks.

Warships usually sailed along the coast, but there are numerous examples of fleets sailing across the open ocean. The confined quarters, large

number of crew and limited storage space meant that overnight sailing was not a usual occurrence, but it did happen on occasion if required. Winter usually curtailed sailing and major naval operations, as warships were not designed to endure bad weather and were at the mercy of winds and sea. A fleet of Persian ships was destroyed off the seaward coast of the island of Euboea in 480 by a storm, and the victorious Athenian fleet after the battle of Arginusae was prevented by a storm from rescuing their lost sailors.

Modern knowledge of warship design is based primarily on pictorial representations, written sources and a very small amount of archaeological evidence. Much work has been done on a reconstructed trireme, the *Olympias*, but how representative it is of a fifth century Athenian trireme is debated. No warship has been found archaeologically, aside from the metal rams fitted to them. The remains of large ship sheds have been excavated in Athens and provide a good indication of the size and dimensions of a trireme. Warships are depicted on pots, including scenes of ships fighting one another, back to the twelfth century. Although these are artistic representations, they are useful for demonstrating how early ships were used for fighting and in showing rough pictures of how ships may have looked. With regards to rowing arrangements, much information has been extrapolated from rowing galleys of the fifteenth to seventeenth centuries CE.

The "Lenormant Relief" showing rowers on a trireme, ca. 410–400. The relief may well show the *Paralos*, one of the Athenian state triremes, and commemorate a victory in the Panathenaic Festival boat races. It provided important detail of the trireme's rowing system to scholars who created a replica vessel, the *Olympias*, in 1987. Located in the Acropolis Museum, Athens, Greece. (Ancient Art and Architecture Collection Ltd./Bridgeman Images)

Unlike merchant vessels, which have been found on the ocean floor, warships and especially triremes were neutrally buoyant and did not sink to the ocean floor—if holed or damaged they would float until they broke up. In practice, this meant that ships said to be “sunk” in battle are better described as disabled. The crew would have been required to abandon the ship, effectively taking it out of the fight. Often these ships were recovered by the victorious side after the battle, and sometimes they could be repaired and put back into service. Depending on how a ship was looked after it might be expected to have a serviceable life of 20 to 30 years.

When not in use ships were usually laid up on a beach or in purpose-built slipways such as the large ship sheds built in Athens. While on campaign ships could be either anchored or hauled up onto the beach for crew rest and maintenance. Ships kept in the water for too long a period

became waterlogged and heavy, slowing them down. However, if a ship was left out of the water for too long the shrinking of the timbers as they dried out would cause the seams to leak, leading to excess water ingress. While on campaign in Sicily, the Athenian general Nicias sent a dire warning back to Athens about the state of his ships. He wrote that because their ships had been on campaign for so long and had not been able to undergo maintenance while the Syracusan vessels had, the Athenians were losing their edge at sea and were at risk of defeat (Document 12). Other examples make it clear that proper maintenance had a huge impact on the effectiveness of warships.

Warships used by the Greeks could have a number of rowers varying from 50 to upward of 200. These rowers had to be well trained to operate the ship effectively and were practiced regularly. In Athens, those men unable to afford the equipment required to fight as hoplites were enlisted as rowers for the navy and indeed in time they were paid for this service. Aside from rowers, warships also carried a small crew to handle the vessel, as well as a contingent of marines (*epibatai*). Ancient sources indicate that most sailors could swim, but marines would have been at high risk due to the encumbrance of their armor (see illustration in Naval Warfare entry).

Some of the earliest types of warships were known as a triaconter and penteconter, a 30 and 50-oared ship, respectively. Nine penteconters were present at Artemisium in 480, the entire contingent of the Opuntian Locrians being made up of this warship type. Herodotus lists triaconters and penteconters among the light boats and transports of the invading Persian forces. Although they were superseded in time by the trireme and other larger ships, penteconters could still be found in service into the middle of the third century in Sicily.

The primary warship used by Greek forces in the fifth and fourth centuries was the trireme (*trieres*). Thucydides says that Corinth was the first city to develop the trireme, perhaps as early as the eighth century. The Corinthians are also said to have engaged in one of the earliest naval battles in history. According to Thucydides, it was not until the invasion of the Persians in 480 that triremes became the dominant warship in use and even then the early Athenian triremes didn't have complete decks. This would mark a period of over 150 years during which the trireme was the dominant warship.

Triremes were not of a standard or universal design, varying across

different times and places. During the battle of Salamis in 480 the Athenian ships are described as lighter than the ships of the opposing Persian coalition, including the ships of the Greek islands fighting for Xerxes. The Athenian navy mostly favored light and fast triremes with a ram ideally suited to attacking enemy vessels (see illustration in Naval Warfare entry). The exception to this was in the 460s when the general Cimon focused his tactics on boarding rather than ramming. Although he was successful, these battles incurred a large number of casualties and the Athenians subsequently went back to ramming as their main battle tactic. Other powers favored slower and heavier ships which could carry more marines for boarding. During the Sicilian Expedition of 415–413, the Corinthians and Syracusans modified their ships with reinforced bows and upper-works. In the confined waters of the Corinthian Gulf and Great Harbor at Syracuse this gave their ships an advantage over the Athenian ships, which could not use their speed to maneuver and avoid attacks. They also embarked many marines, used for boarding and acting as skirmishers who could kill and wound enemy oarsmen. However, in more open waters the heavier ships were at the mercy of the fast Athenian ships which could use their speed to attack the vulnerable flanks of the opposing ships. Ship design depended very much on the prevailing operating environment and the anticipated enemy ship design and crew skillset.

Triremes had three types of rowers: *thranitai*, *zygitai*, and *thalamitai*. The orthodox model of the trireme has these three different classes arranged on three distinct levels, though this model has been contested by some, such as Alec Tilley. A fifth-century Athenian trireme carried approximately 14 crew members and 14 marines and, under the conventional model, up to 170 rowers. The equivalent to a captain on such a vessel was known as the trierarch (*trierarchos*), who in Athens at least was responsible for the maintenance and provision of a trireme and its crew for an entire year. A trierarch, who was selected for his wealth, might or might not have had any actual seamanship experience. The executive officer, or the commanding officer when the trierarch was inexperienced, was known as the *kybernetes* or pilot. A skilled *kybernetes* was important to the effective use of a warship. During the Peloponnesian War the island of Samos sent their skilled pilots to the Peloponnesian navy as aid.

The trireme was eventually superseded, but not entirely replaced, by ships known as a “four” or quadrireme (*tettreres*) and soon after the “five” or

quinquereme (*penteres*). The Carthaginians are credited with developing the “four” and Dionysius I of Syracuse with the “five,” an immediate response to the naval threat posed by Carthage. The arrangement of rowers for these ships is unknown, though they could not have been arranged in ships of four or five levels as this was unfeasible from an engineering perspective. Therefore, they will have had more than one rower to an oar. Only one of the rowers on each oar was required to be trained and experienced for the rowing to be effective; the second or third rower merely provided extra muscle power.

The tactics employed by the “fours” and “fives” of skilled and well trained navies, such as Athens and Rhodes, were much the same as for triremes, focusing on maneuverability and ramming attacks. However other navies began to employ a greater number of marines, archers, and artillery as a means of attacking other ships at sea. As demonstrated during the battle of Salamis off Cyprus in 306, triremes could not take on the larger quinqueremes on their own and prevail. Although more maneuverable, the smaller triremes would have had trouble piercing the hulls of the larger vessels and would be left vulnerable to missile weapons and boarding by a superior number of marines embarked in the larger ships.

After the age of the “fours” and “fives” came that of the polyreme (*polyeres*). These ranged in size from “sevens” all the way up to a “forty” of the late Ptolemaic navy. The design and rowing arrangements of these ships are least well known of all, and stupendous dimensions are given for some of these vessels. The largest of these ships supposedly included crews of thousands of men for rowing and fighting. What is easier to assess is the tactics used by such large ships, which would have had to focus exclusively on the use of artillery, archers, and subsequent boarding; they would have been far too large and unwieldy for ramming attacks. It is also possible that the largest of these, such as the “forty,” were only ever used as flagships and prestige pieces and not as actual warships.

Around 190 the Rhodians used the unorthodox tactic of employing fire-pots to attack enemy ships in battle, a dangerous but effective tactic if done carefully. Fire is the greatest of dangers to a ship, especially the wooden ships of this period. In the mid-fifth century during the Athenian expedition in Sicily fire was used as a weapon, the Syracusans launching a fireship at the Athenians and causing a panic until the threat was neutralized by fending it off. Fire would of course destroy an enemy ship or at best make it

unserviceable if captured.

Not all ships employed by navies were the better-known triremes and quinqueremes of the later periods. The Illyrians used a small vessel known as a *lembos* (pl. *lemboi*). The normal meaning of the word is a skiff, but it is often referred to in a naval sense and especially as a vessel used by pirates. Philip V of Macedon in 200 used *lemboi* against Rome, not so much in battle but as a type of auxiliary naval vessel conducting raiding and transport duties. Polybius implies in his narrative that they were used in battle as a small vessel able to dart in between the larger ships and board enemy vessels. This could only be effective in concert with larger vessels, but it nevertheless demonstrates the utility of a range of different warships for different purposes.

Another small vessel used in warfare and especially by pirates was known as a *hemiolia*, meaning “one and a half.” It was an unusual combination of a vessel designed to sail and be rowed at the same time and was primarily designed as a fast ship for overtaking other vessels. From this the Rhodians, in approximately 300, developed the *triemiolia*. How exactly it differed from a trireme is not known, though it must have been a lighter vessel with better sailing characteristics. It was used with great success by the Rhodians to destroy pirates in the smaller *hemioliai* until the Romans stripped Rhodes of its fleet, effectively ending the use of this type of craft in naval warfare.

Warships were often converted into troop- or even horse-carrying transports. A force of Peloponnesian ships was defeated by half as many Athenian ships in 429 because they were fitted out for carrying troops rather than as fighting ships (Document 8). Modifying triremes into troop transports does not appear to have required much, if any, physical modification to the ships and was more a matter of trading oarsmen for troops. In fact Thucydides twice (3.18.3–4, 6.91.4) mentions triremes manned by soldiers who also acted as rowers. Horse transports were used prior to the Peloponnesian War (431–404), but in 430 Thucydides says that for the first time triremes were modified to carry horses. Alexander utilized Athenian triremes to carry siege equipment to the siege of Halicarnassus in 334. Though not ideal, warships could be used as troop and horse transports if needed.

Though the main warship used in naval warfare progressed through several stages—penteconter, trireme, quinquereme, and polyreme—navies

almost always consisted of a mix of different vessels. Triremes remained in use for up to five centuries in one form or another and other smaller craft such as the penteconter and the *triemiolia* could be found in naval forces throughout the centuries. These smaller ships obviously filled important auxiliary roles, in and out of combat operations, demonstrating the complexity of both naval warfare and seafaring in general. The variety of operating environments and unique needs of city-states led to a wide variety of warships being adopted over a long period of time.

Sicilian Expedition (415–413)

The failed Athenian expedition to Sicily (415–413) played a major part in the reactivation of the Second Peloponnesian War (431–404) after a period of pseudo-peace, and significantly contributed to Athens' ultimate defeat.

In 416, Segesta (also known as Egesta) requested help against Selinus, its neighbor, and Syracuse, the main Greek city on Sicily. In 415, after the return of an Athenian fact-finding mission (which had been misled about Segesta's wealth), the Athenians appointed Alcibiades, Lamachus, and Nicias to command an expeditionary force. A subsequent attempt by Nicias to reverse the assembly's decision only resulted in an increase in the force's

size. Thucydides cannot have heard the speeches of Nicias and Alcibiades, but his versions are interesting in setting out the pros and cons of the expedition and the characters of the two main commanders.

The Athenian force was as large as the biggest deployed to date. It had 134 triremes (34 from allies), 2,300 citizen hoplites (700 were *epibatai* or marines) another 2,800 allied or mercenary hoplites, 480 archers, 700 slingers, 120 Megarian *psiloi* (light infantry), and 30 Athenian cavalry. On arrival, the true state of Segesta's finances was revealed and the generals had to rethink. Nicias wanted to force peace between Segesta and Selinus and then sail home, making a demonstration of force along the coast. Alcibiades wanted to mobilize as much of Sicily as possible and attack unless Selinus made peace with Segesta and Syracuse restored Leontini. The best plan, in terms of focusing on the center of gravity, was Lamachus'. He advocated sailing to Syracuse and taking it while it was still unnerved. As the junior general, and unable to convince his colleagues, he ended up supporting Alcibiades.

Soon after this Alcibiades was recalled to Athens charged with profaning the Mysteries, but deserted to Sparta en route. This left the ill and reluctant Nicias as the senior commander. In addition, Alcibiades revealed a plot to betray Messina to Athens and persuaded the Spartans to send reinforcements and a Spartan general to Syracuse.

Meanwhile, Nicias gained an unopposed landing near Syracuse. The Athenians won the first battle, losing 50 men, but failing to inflict more than 260 enemy casualties because of the dominant enemy cavalry. Because of this, Nicias and Lamachus wintered in Catana to arrange more cavalry. They renewed the attack on Syracuse in spring 414 after 250 Athenian cavalrymen and 30 *hippotoxotai* (mounted archers) arrived.

At first things went well—the Athenians won a battle on Epipolae (a hill overlooking Syracuse) and began to isolate the city by building a series of forts and walls around it. The Athenians also defeated two Syracusan attempts to build counter walls at right angles across their wall, although Lamachus was killed in the second engagement. Nicias, increasingly unwell and unable to cope, was now in sole command. Blockaded from the sea and with the Athenian wall rapidly extending, the Syracusans considered coming to terms.

At this point the Spartan Gylippus and 3,000 men managed to run the Athenian blockade and reach Syracuse. His arrival galvanized the defense.

Although they lost the first pitched battle designed to let them complete their third cross wall—Gylippus had deployed them in a narrow space, negating their cavalry advantage—the defenders won the next one. This allowed them to complete their cross wall, ending Athenian hopes of completing their wall.

From this point the Athenians were on the defensive, continually harassed by the enemy cavalry. Eurymedon arrived in winter 414/3 with 10 triremes and money and in spring Demosthenes arrived with 73 triremes, 5,000 Athenian and allied hoplites, and large numbers of slingers and archers. He arrived none too soon—Nicias had suffered a naval defeat in the harbor and had lost a key fort, Plemmyrium. Worse, the Spartans now reopened hostilities in Greece.

Demosthenes quickly organized a daring night attack on Epipolae so work could resume on the Athenian wall. However, as the Athenians and allies were pressing home their initial success, they became confused in the dark and suffered heavy casualties. Demosthenes and Eurymedon argued for a withdrawal but Nicias clung on, first hoping that Syracuse would be betrayed to them, and when this was dashed by the arrival of enemy reinforcements, for religious reasons delayed another 27 days after an eclipse. The delay was fatal. The Syracusans attacked by land and sea. The land attack failed but the Athenian fleet was defeated and Eurymedon killed. A second, heavier naval defeat ruled out a sea withdrawal. The ensuing land withdrawal was relentlessly harried, especially by the enemy cavalry, until it collapsed at the River Assinarus. Around 7,000 Athenians and allies were captured. The prisoners were not very well treated and Nicias and Demosthenes were executed.

The destruction of the Athenian expedition, with its huge loss of men and ships (Athenian and allied) was a major material and psychological blow to Athens and a boost to the Spartans. Revolts broke out in several places and Athens never really recovered. The Sicilian disaster was not the only cause of Athenian defeat in the Second Peloponnesian War but it was an important one.

Sicily

Sicily, the largest island in the Mediterranean Sea, may have seemed far from the Greek mainland, but once Greeks set colonies on the island in the eighth century it became part of the Greek world. East-west interaction affected warfare in both regions.

Greek traders sailing west were long familiar with Sicily and southern Italy. By the late eighth century, various Greek cities facing population pressure created colonies in eastern and southern Sicily, the most important of which was the Corinthian colony Syracuse. In the western part of the island, Carthaginians established trading colonies. In the interior of the island and along parts of the coast indigenous settlements of Sicel and Elymi peoples continued to exist, occasionally fighting against or siding with one city or another in wars. Trade with Greece, southern Italy, and Africa as well as agricultural wealth of their own permitted Sicilian coastal settlements to prosper.

In the sixth and fifth centuries, the prosperity led to military conflict among the Greek cities and especially against the Carthaginians in the west. These threats made it possible for leaders to seize power. Tyrants ruled many of those cities, like Phalaris and Theron of Acragas, and Gelon and Hieron of Syracuse. These tyrants used military tactics similar to those employed in Greece such as the hoplite phalanx and cavalry in support. Warfare between cities and against Carthage was sufficiently common in this period that the Sicilian Greeks acquired a reputation for military ability. When the Hellenic League faced Xerxes' invasion in 480 they approached Gelon of Syracuse for assistance, but he was busy preparing to fight Carthaginian forces. In 480, Gelon and Theron won an enormous victory

against the Carthaginians at Himera that solidified Gelon's rule, but also brought peace with Carthage.

During the Second Peloponnesian War (431–404) Athens made treaties with several Sicilian cities and sent missions there. The first time, 427–424, they sought assistance in Sicily and southern Italy and sent a small force west. In 415, after Sicilian allies had requested aid, Alcibiades convinced the Athenian assembly that the conquest of democratic Syracuse would be highly profitable and would hurt the Peloponnesian League. The city sent an enormous force of more than 100 triremes and numerous support ships along with more than 5,000 soldiers. Syracuse successfully appealed to Corinth and Sparta for assistance. The expedition went badly from the start and in the end failed to achieve anything for Athens except enormous loss in men and material.

Beginning in 409, the Carthaginians attempted to conquer the entire island, capturing nearly all except the eastern coastal cities. Dionysius I succeeded in establishing himself as tyrant of Syracuse and used his mercenary armies and improved siege techniques to defeat the Carthaginians and push them back to the far west of the island. His innovations in siege warfare had a dramatic impact on the rest of the Greek world as he adopted Near Eastern siege techniques. His victory ushered in an extended period of tyranny in Syracuse (398–367) that ended in more fighting between the Greek cities and with Carthage.

Facing a renewed Carthaginian threat in the second half of the fourth century, at Syracusan request Corinth sent out Timoleon with a small force. He defeated the Carthaginian forces at the Crimisus River in 341 and with mercenaries established Greek rule over most of Sicily by 340. Timoleon's efforts to stabilize the Greek cities ended in failure when oligarchy reemerged in Syracuse. Agathocles came to power in Syracuse after a coup in 316 and was invited to become *strategos* with absolute power—tyrant. Once he consolidated his power he unified the Greek cities militarily and provoked a new war with Carthage. He tried and failed to distract the Carthaginians by invading Africa and finally restored the Sicilian status quo from before he took power in Syracuse. His efforts to unify Sicily and south Italy under his control failed also. After his assassination, his mercenaries, the Mamertines, seized control of Messana.

The Greek cities of Sicily remained at odds and unstable during the first half of the third century. Pyrrhus of Epirus was invited in to settle matters,

but unable to establish himself he returned to Italy. Hieron II, tyrant of Syracuse in 271 defeated the Mamertines in 265, leading directly to Roman involvement in Sicilian affairs. Rome allied with the Mamertines and attacked Syracuse in 264, forcing it to make alliance in the following year.

When in that same year Rome moved against Acragas, a Carthaginian ally, the First Punic War actually began. Fighting ranged over western Sicily and in the surrounding seas, finally ending after the battle of the Aegates Islands in 241. That war made much of Sicily a Roman province and strengthened Hieron's position in Syracuse until his death in 215. Hieron had supported Rome at the outbreak of the Second Punic War, but after his death Syracuse allied with Carthage, leading to its sack by Marcellus in 211. After that Syracusan territory was added to the province which remained under Roman control for the remainder of the Republic.

Sicily may seem a sideshow compared with mainland Greece, but it was an important part of the Greek world and the military activity there had impact in the Aegean.

Sicyon

A city in the northeast Peloponnese, located slightly inland from the Gulf of Corinth, and neighboring Corinth to the west. The city was based around an acropolis on a triangular plateau, and had, in legend at least, been ruled by a dynasty of autochthonous kings, founded by Aegialeus. After the fall of this dynasty, Sicyon was believed to have had close relations with Argos (rather than the closer Corinth). These Dorian connections with Argos were apparently weakened after 660 by the tyrant Orthagoras, under whom the city flourished and emphasized its non-Dorian elements. The city reached the zenith of its power under Orthagoras' grandson, Cleisthenes, who formed a marriage alliance with the powerful Athenian family, the Alcmaeonidae.

Sparta later overthrew the tyranny in the 550s, after which the city became a loyal ally, joining the Peloponnesian League and following Spartan policy, and siding with Sparta against Corinth during the Corinthian War (395–387/6). The city was sacked and razed by Demetrius I Poliorcetes in 304/3. Under Aratus of Sicyon, the city became a prominent member of the Achaean League until the latter was dissolved by the Romans in 146.

Siege Warfare

Warfare between the Greek city-states of the Archaic and Classical Periods was largely defined by pitched hoplite phalanx battle, but the Greeks also devised a variety of techniques to attack and defend fortified places. However, for much of Greek history, the techniques remained somewhat crude. For example, until the end of the fifth century, methods of siege warfare were largely limited to attempts to storm a site with an infantry assault, usually with the aid of scaling ladders. Failing that, the attacking force might instead settle into a protracted siege, meaning that the attackers would completely encircle the enemy walls with their own fortifications (a procedure known as circumvallation), sometimes combined with a naval blockade as circumstances dictated. The object was either to starve out the defenders or to wait for a traitor to open the gates to admit the attacking force. The legend of Troy, which took 10 years to subdue and mentions no effort to actually storm the city's defenses, probably reflects the frustrations this kind of primitive siege warfare could engender.

By the late eighth century, the armies of Near Eastern empires had perfected techniques of siege warfare well in advance of the Greeks. They had long been using various machines and scientific methods to reduce enemy fortifications, and so the Greeks, who were deeply impressed and even victimized by Persian siegecraft in the era 546–479, began to copy some of these tactics. These tactics included the use of battering rams to tear open an enemy gate or knock down a weak portion of a wall, siege mounds heaped against walls to bring attackers to the top of a wall, and miners tunneling under walls. Yet prior to the Second Peloponnesian War (431–404), our sources mention few sieges that were brought to a successful conclusion, and nearly all of those were through betrayal rather than assault. Traditional Greek warfare did not generally aim to conquer enemy cities and territory, and the devastation of cropland usually incited an enemy to come out from their fortified city to defend its fields. In fact, heavy infantry so dominated Greek armies that they generally lacked the sorts of soldiers necessary for siege warfare, such as archers and slingers. So too, the farmers and craftsmen who made up the hoplite armies of the Greeks could not sustain long campaigns because they could not be away from their livelihoods for extended periods.

Consequently, down through the end of the Second Peloponnesian War

(431–404), sieges were still largely a waiting game, and harbor towns (such as Athens) could almost never be captured without being completely blockaded, by both warships at sea and troops on land. Moreover, as the Greek historian Thucydides remarked, few states were wealthy enough to afford the cost these kinds of military operations would necessarily entail (Thucydides 1.11). The Athenians, for example, spent more than 2,000 talents on the siege of Potidaea, equivalent to nearly three and half years of the annual revenues generated by all of Attica (Thucydides 2.70). Moreover, if the circumstances required a long siege, privation and disease could inflict a crippling toll on the besieging army. At Potidaea, for example, the Athenian general Hagnon claimed that plague had killed more than a quarter of his soldiers in just 40 days (Thucydides 2.58).

For the defender in such cases, sieges were obviously the most demanding and difficult form of warfare. Besides a need to be continuously on guard, working in shifts for months or years on end, the conditions would only worsen with time as disease and privation took hold. The besieged would have needed to mobilize all available resources, including the elderly, women, slaves, and even children in the defense of the city (Aeneas Tacticus 40.4). If the walls were breached, the fighting would be house-to-house, during which heavy casualties would likely be inflicted, on both sides. In such cases, women and children could find themselves taking an active part in the fighting (Plutarch, *Pyrrhus* 34). In cases of circumvallation, starvation could even raise the specter of cannibalism, as was alleged to have occurred at Potidaea in 428 (Thucydides 2.70.1).

The Greek city-states of Sicily may have been more experienced in siege warfare, having learned techniques from the Carthaginians, who were themselves familiar with Near Eastern methods. For example, the historian Herodotus (7.154) said that the tyrant of Gela, Hippocrates, was an expert at siege warfare in the 490s. Herodotus explains nothing about his methods, other than that he employed large numbers of mercenaries, who would have made it possible for extended siege operations—provided they could be paid.

The Second Peloponnesian War (431–404) and its struggle for hegemony between the Athenians and the Spartans altered the conditions and practices of Greek warfare, making siege warfare far more important than it had been. It was now necessary to control strategic points that determined the balance of power, so the taking (or defense) of a fortified position

became one of the central problems of Greek warfare.

This problem became evident in one of the first military actions of the Peloponnesian War, a Spartan-led attack on the small city-state of Plataea. Thucydides' account of the siege reveals the near impossibility of taking a fortified position by one of the most powerful Greek armies. Outnumbered many times over, the 400 Plataean defenders nevertheless thwarted numerous attempts to storm the city. The Spartans and their allies tried every method of assault known to them: scaling ladders, battering rams, siege mounds, and even an elaborate incendiary attack, but nothing could breach the Plataean defenses (Thucydides 2.66–78). The Spartans finally settled for circumvallation instead, and 2 years later, the 200 or so Plataean defenders that remained (more than half had actually made a daring escape) finally surrendered.

The Spartan failures at Plataea typify the Greek experience of siege warfare during the Peloponnesian War, and even the Athenians, who were reputed to be the most experienced at siege warfare, accomplished even less in their own siege of the city of Syracuse (415–13). In fact, there are no instances during the war in which siege engines like the battering ram were successful, except for a novel flame-throwing device employed by the Thebans in an assault against a hastily constructed Athenian fortification at Delium in 424. This drove the defenders from the walls, allowing the Thebans to conduct an assault (Thucydides 4.100).

Treachery was by far the most common and the most successful means of capturing a fortified city. Lengthy sieges placed the whole of a city's population under duress, and in such extremity, the cohesion and morale of the *polis* often fractured, and someone inevitably betrayed the city to the enemy. As the Peloponnesian War progressed, warring states soon discovered that establishing a fortified position in the countryside was just as successful in creating such stresses and denying resources to the enemy. For example, the Athenian general Demosthenes established a fortified outpost in Spartan territory at Pylos in 425, from which he hoped to induce Helots to revolt. The prospect so alarmed the Spartans that they immediately aborted their own invasion of Attica and marched against this Athenian fort, which, not surprisingly, they failed to take by storm (Thucydides 4.3–14). More devastating, late in the war, the Spartans fortified an outpost in Attica at Decelea, which became a magnet for escaping Athenian slaves (Thucydides 7.27).

A shift in the patterns of Greek siege warfare came in about 399 on the island of Sicily when Dionysius I, the tyrant of Syracuse, commissioned craftsmen and engineers from Italy and Greece to devise new weapons with which to defend his city. The result was the creation and development of a new kind of siege machine—the catapult. The earliest type of Greek catapult resembled a giant crossbow, set atop a stand for stability and accuracy. This wooden device shot a single, up to six-foot-long, arrow further and more accurately than a conventional composite bow. Although it was not powerful enough to knock down walls or blast through a gate, the arrow could easily pierce a hoplite armor or shield (or both), hence the Greek name *katapeltes*, “shield-piercer.” Volleys from a number of these catapults would provide covering fire for troops conducting (or defending against) siege operations, so tactically, they were employed no differently from regular archers or slingers.

Although these early catapults had greater range and power than conventional bows or slings, they were more unwieldy and far less mobile, making them vulnerable to a sudden enemy sortie. Therefore, the besiegers’ catapults would often be perched inside large, mobile siege towers. The Greek siege tower, undoubtedly adapted from a Carthaginian design, was a wooden structure, built at least as tall as the enemy wall to be attacked, and often armored against missile and incendiary attack. Elaborate versions of the siege tower would site catapults on internal parapets with portholes facing the enemy through which they could discharge volleys of missiles. The towers were pushed or pulled forward on wheels, and as they approached the enemy wall, other soldiers could prepare the ground ahead to ease its passage. Some siege towers were designed to be pushed right up to the enemy city wall, to bring up attacking troops on internal ladders or to employ a ground-level battering ram. Others may have employed a kind of ramp or bridge that was lowered onto the enemy wall when close enough. Siege towers were obviously expensive and laborious to construct, and difficult to employ in battle, but apart from setting fire to them, hastily heightening a city wall, or undermining the avenue of approach, there was little that could be done to stop these machines from attacking the city walls.

Greek catapults and siege towers were first used by Dionysius in the capture of the Carthaginian island stronghold of Motya, in western Sicily in 398, where they were used in conjunction with a mole to bridge a channel of

water. The immense height of the defensive walls at Motya obliged Dionysius to construct six-story towers, which were rolled the length of the mole, probably with teams of oxen. Catapults situated within the tower drove the defenders off the wall while battering rams housed within the towers attacked it.

The success of Dionysius' dramatic assault on Motya encouraged imitation and improvement by others. Within a generation, a much more powerful type of arrow-shooting catapult was developed, probably in Thessaly under the tyrant Jason of Pherae (reigned ca. 385–370). This new design used the principle of the torsion spring. Instead of a horizontal, bending wooden bow, the torsion catapult featured two vertical cylinders of tautly skeined or twisted hair or animal sinew, set on either side of the front of a long horizontal wooden stock. Jammed into each twist was one wooden arm, extending outward; the arms' outer ends were attached to a bowstring which crossed behind the springs and over the stock. Winched back, the bowstring brought tremendous tension from the twisting skeins of hair or sinew, transferring that power to propel a large arrow (or possibly a round stone) laying in the groove on the stock. These new kinds of catapults were several orders of magnitude more powerful than the earlier versions (which undoubtedly continued in use), but they were also much more complicated, even less mobile, and required highly-skilled and knowledgeable operators to be used effectively. Nevertheless, the basic design could be scaled up, and the largest versions of the torsion catapult were capable of launching projectiles up to 80 kilograms a distance of almost 200 meters. By some accounts, this kind of catapult could completely destroy a wooden gate or palisade, and might also batter down a poorly built stone wall.

Greek siege warfare reached its apogee under the Macedonian kings Phillip II (reigned 359–336) and Alexander the Great (reigned 336–323), both of whom successfully coordinated the use of siege towers, torsion catapults, battering rams, scaling ladders, siege mounds, and even moles.

Philip showed keen interest in military innovation, he possessed significant financial resources, and like Dionysius, Philip attracted skilled craftsmen and engineers to work out new techniques of siege warfare. Philip's catapults were torsion-powered arrow-shooters, but Philip used them in novel ways, always in concert with other kinds of assault tactics. For example, in the siege of Perinthus, Philip used several different kinds of catapult, along with large numbers of slingers, siege towers that far

exceeded the height of the city walls, and sappers who collapsed a portion of the city wall by undermining it. Ironically, Perinthus did not fall, for the defenders had erected a second wall inside the first, and then used the buildings of the city itself, which rose in a kind of conical shape, with tiers of houses acting as concentric lines of defense.

It was Philip's son Alexander the Great who (among other achievements) pioneered the use of rock-firing catapults. Alexander's "stone-throwers" (*lithoboloi* or *petroboloi*) could hurl 170-pound (77-kilogram) boulders more than 190 yards (about 170 meters), to batter apart enemy walls. On occasion, Alexander mounted catapults of this type aboard ships. Machines of this kind helped Alexander to capture the island fortress of Tyre, in one of history's most complex and stunning sieges, conducted simultaneously by land and sea (332). The defenses of Tyre were formidable. It stood on an island half a mile off-shore, with walls in places that were 150 feet (45 meters) high. Alexander had few ships with which to blockade the island, so the only viable means of attacking the city was to construct a mole, an artificial causeway of earth and stone, to connect the island to mainland. To protect the workers constructing the causeway, Alexander had constructed two huge siege towers, each one at least 45 meters tall, reputedly the tallest ever constructed in the ancient world. Each tower was covered with treated rawhide to protect them from incendiary attack, and catapults were mounted in them to provide covering fire for the workers toiling below.

However, the Tyrians destroyed them with fire-ships, essentially a large transport ship stuffed with combustible material, doused in pitch and sulfur. Alexander redoubled his efforts, widening the mole to accommodate new siege towers, and collecting a fleet to protect it. Eventually, the mole came right up to the base of the wall on the mainland side of the island, but attacks against the fortifications there made no impression whatsoever. Alexander then attacked the walls elsewhere with rams mounted on ships, and after a few abortive attacks he finally managed to overwhelm part of the city's defenses. Although the Tyrians abandoned the outer defenses of the city and sought refuge in a citadel at the northern end of the island, here too they were overwhelmed. Alexander gave vent to the frustrations of the seven-month siege and allowed his army to massacre the population. The Tyrian dead numbered at least 8,000, and all the rest of the population, close to 30,000 people, were sold into slavery.

Alexander and his Successors of the Hellenistic Period were the most ambitious besiegers the world had yet seen. The Macedonian prince Demetrius I Poliorcetes won his surname, which means “city besieger,” from his huge—but unsuccessful—siege of Rhodes in 305–304. Demetrius’ armament included two massive battering rams (iron-clad tree-trunks, perhaps 40 meters long, hung inside mobile sheds and worked by hundreds of men) and an armor-plated siege tower called the Helepolis, or “taker of cities,” containing nine levels of stone-throwers and arrow-catapults.

Of course, tactics of siege defense also improved in this era, with catapults on city walls shooting flaming projectiles against wooden siege machines, but generally the advantage had now swung to the besiegers.

Unquestionably, the human cost of war was the greatest in sieges, where not only were there enormous numbers of killed, wounded, or executed, but also large numbers of refugees. Whole city populations might have tried to escape from a city expected to undergo the ordeal of a siege, and rarely could a refugee population find a safe haven that would allow them to remain together. The citizens of Troezen were reputed to have played host to thousands of Athenian refugees during the Persian Wars, and most returned home with the retreat of the Persians after the battle of Plataea (479), but most refugees would be lucky to be reunited after what could amount to years in exile. For most, this meant a life of poverty and want (Tyrtaeus 10.3–12).

Siris, Destruction by Croton, Metapontum, and Sybaris (ca. 570 or 550)

The Ionian colony of Siris was destroyed in the sixth century by an alliance of the Achaean colonies of Croton, Metapontum, and Sybaris, spearheaded by Sybaris' expansionist ambitions. Siris and its territory were subsequently incorporated into the sphere of Sybaris.

According to Strabo (6.1.14), Siris was settled by the indigenous Chones who were violently conquered by Ionians from Colophon fleeing their homeland. However, cooperation between the Greeks and the indigenous population is suggested by a communal cemetery.

By the mid-seventh century Siris was renowned for its fertile land, prosperity, and its love of luxury (Athenaeus 12.25). Although Siris was on friendly terms with its indigenous neighbors the nearby Achaean *poleis* were competing for territory. Expansion of Siris was prevented in the south by the presence of Sybarite territory, and the foundation of Metapontum in 630 halted Sirite expansion to the north. The foundation of Metapontum also coincided with the destruction of Incoronata, a Sirite outpost located 18 kilometers north of Siris.

Sybaris' intent on territorial expansion led to a coalition with Croton and Metapontum to take over its wealthy neighbor and rival. Although Locri came to Siris' defense the city was destroyed. The date of the destruction is uncertain but possibilities include ca. 570 or ca. 550. There are signs of continued habitation at Siris but numismatic and epigraphic evidence indicate that it became a dependent of Sybaris until the latter's destruction in 510 by Croton.

Slaves in War

Herodotus tells the story (4.3–4) of rebel Scythian slaves who successfully carried on warfare against their masters until these attacked them with whips. The slaves were then immediately cowed and defeated. This story can be set against the universal assumption in the ancient Greek world that slaves were subhuman and that fighting in the manly business of war was for free men only.

Excluding slaves from war, or rather not conceiving they could have any part in combat, was virtually invariable. Any exceptions to this were few in number and usually problematic. Thus Pausanias (1.32.3) stated that slaves who fought beside their Athenian masters at the battle of Marathon were buried in the same tomb as the Plataeans. There is however no other evidence that the Athenians used slaves as combat troops then. Such a step goes against the common Greek practice and, if true, could conceivably be explained by arguing that it was an extraordinary measure brought about by the dire straits the Athenians were reduced to in this conflict with non-Greeks. Greek armies invading the territory of other Greeks did not call upon the slaves in enemy territory to rebel. Aristotle notes (*Politics* 2.1269b) that, despite the endemic warfare among Cretan cities, the belligerents all had *perioikoi* (serfs) and so did not call on the *perioikoi* of their opponents

to join in a war. This recognition of common interest among the Cretan states ensured that there were no servile uprisings.

Like Crete, Sparta possessed a peculiar social structure, with a large serf population of Helots (comparable in many but not all respects to the *perioikoi* in Crete). In the great Helot rebellion of ca. 465–456, Sparta called on the help of its allies to suppress the rebels. Exceptionally, the Helot rebels who held out on Mount Ithôme were allowed to depart under a treaty, in effect being treated as free persons. Athens, now hostile to Sparta, settled these refugees in Naupactus, in this instance too treating them as free persons. Messenians from Naupactus later fought on the side of Athens.

In the Second Peloponnesian War (431–404), the Athenian occupation and fortification of Pylos on the west coast of Messenia and later their seizure of the island of Cythera to the south of Laconia, caused the Spartans grave anxiety over the prospect of Helot unrest and even mass defection. Even if the actual outcome in this regard never matched Athenian expectations, it was an important part of the strategy in the war. After the peace of Nicias of 421, a subsequent alliance between Athens and Sparta included a clause that Athens would help Sparta if the slaves (i.e., the Helots) revolted (Thucydides 5. 23). Sparta however gave no such guarantee to Athens in return: an uprising by slaves in Athens was out of the question because it was simply not thought of. Athens clung to the strategy of hoping to put pressure on Sparta by the threat of Helot defection in the Peloponnesian War, but never even entertained the thought of trying to provoke a rebellion among, say, the slaves of Corinth or Chios (the biggest slave-owning state after Sparta, as Thucydides notes: 8.40). Sparta was, as in so many other respects, exceptional and so was the scene of an exceptional kind of warfare involving slaves.

In ordinary practice, slaves were used on campaigns as attendants, porters, and laborers. Athenian hoplites on campaign who could afford it were accompanied by one or more slave attendants but there is no evidence or even likelihood that such slaves took part in combat, even as unarmed stone throwers on the fringes of a battle. If they did, no ancient writer thought so insignificant a thing worth mentioning. Some of the slaves who accompanied armies as menials did desert to the other side. What they expected to gain by doing so is dubious. There was massive defection by slaves from Attica during the Spartan occupation of Decelea in the Second Peloponnesian War; a total of over 20,000 is Thucydides' estimate (7.27).

However, these deserting slaves were bought up at bargain prices by the Boeotians, who were thus unexpectedly enriched by this influx of valuable property (*Hell. Oxy.* 17.4).

In their preparations to withstand the great siege by Demetrius I Poliorcetes, the Rhodian state voted to buy from their owners and to free any slaves who fought well enough in the defense of the city (Diodorus 20.84). Such a promise was dictated by the desperate situation Rhodes was in, and even so these slaves were going to be used in a defensive role only (like the old men and boys commonly used to defend walls). Pressing need overrode the convention that any slaves serving in combat should be freed beforehand, as was the practice of Sparta in freeing suitable Helots who were to do military service as *Neodamodeis*.

Calling upon slaves to rise up and join in internal conflict by offering them freedom was a last resort. Both the oligarchs and the democrats did this in the civil war in Corcyra in 427. Interestingly, most of the slaves who answered the call joined the democrats (Thucydides 3.73). Such appeals did not determine the outcome of the conflict: the military value of slaves, who, if enslaved in childhood, had no experience of using weapons, was slight, even in street-fighting, let alone a pitched hoplite battle. In measures adopted in the frantic preparations in Athens to withstand the expected siege by Philip of Macedon after the defeat of Chaeronea (338), the Athenians voted to free slaves to use in the defense of the city but acceptance of Philip's peace offer prevented the Athenians from going down this path. The terms of the oath imposed by Philip and later Alexander on the Greek states in the League of Corinth included an undertaking not to free slaves for political subversion (Demosthenes 17 [*On the Treaty with Alexander*] 15). The fear was present, even if the eventuality was remote.

Tyrants were regarded as disrupting the normal social order, but only the most extremely repressive tyrants made use of freed male slaves as supporters, even in some cases marrying them off to the widows of dead opponents. When such ex-slaves made up the internal security force of a tyrant, they were bitterly hated. Normally, tyrants relied on mercenaries, recruited from among free men.

In contrast to land warfare, slaves were used in the crews rowing triremes by Athens and other states (e.g., Corcyra: Thucydides 1.55; Syracuse under Dionysius I: Diodorus 14.43). Apparently, rowing was regarded as a form of laboring and so distinct from the gentlemanly

business of combat. In the emergency in Athens in 406 when the Athenians had to improvise a fleet to oppose the Spartan fleet blockading Conon in Mytilene, slaves were used in large numbers to make up the crews needed. That freedom was given to these slaves, even if only to some of them, amounts to a remarkable departure from standard practice. Slaves who routinely rowed in Athenian triremes could not expect to be freed.

Athenian “Casualty Lists,” that is, the state memorials commemorating the war dead, occasionally include slaves, distinguished by the title *therapon* (“attendant,” “menial”), a term hardly ever used of free persons. It is not clear why these slaves, if they were such, and not free men, were so honored. Perhaps they were somehow caught up in combat and such a death was unusual enough to earn special treatment.

Slingers (*Sphendonistai*)

The sling was a low status weapon. During the Second Peloponnesian War at Sphacteria it was one of the weapons used by Athenian sailors to force the surrender of the Spartan garrison, and in the civil war after Athens’ defeat, the sling was one of the weapons used by the democrats. As opposed to its archers, Classical Athens never organized a corps of slingers.

This was despite the military virtues of the weapon. During their march home the Ten Thousand Cyrean mercenaries suffered from the (presumably Persian) slingers who outranged the Cretan archers. It was only when they formed a body of slingers from some Rhodian hoplites who could use the

weapon that the Greeks could defend themselves, for the Rhodians knew how to sling lead bullets, which had twice the range of the stones “the size of a hand” slung by their enemies. This is the first we hear of lead sling-bullets, and, indeed, it is only from that time that they start to turn up in the archaeological record. During the retreat the Greeks were also attacked by Carduchian (Kurdish) slingers.

The sling was a preferred weapon of several Iranian peoples. Iranian slingers were much used during the wars of the *diadochoi* and the Hellenistic Period. Craterus took 1,000 Persian archers and slingers to Europe on the outbreak of the Lamian War, and Peucestas had 10,000 Persian archers and slingers. After Antigonos deposed Peucestas as satrap of Persis, Persian slingers begin to appear in his army too, 400 Persian archers and slingers in 314, and 500 Persian slingers in 312 at the battle of Gaza. Cyrtian (Kurdish) slingers served in Antiochus III’s army in 220, but those on the rebel Molon’s side are probably Persians recruited in the eastern half of the empire. Persian slingers fought at the battle of Raphia in 217, and the slingers mentioned in Antiochus’ eastern campaign may have been Persians too. Cyrtian slingers were at the battle of Magnesia.

The Iranian peoples adept in the use of the sling probably used it to protect their flocks. It is notable that the areas of Greece noted for their slingers were hilly and probably supported a pastoral economy. Even the Rhodian hoplites who knew how to use a sling may have been pastoralists. In 415 the Athenians took 700 Rhodian slingers to Sicily with them. According to Thucydides the Acarnanians were famous for their use of the sling, and Demosthenes gathered Acarnanian slingers and javelin men en route to Sicily. We are not told the nationality of the 500 slingers Pyrrhus of Epirus took with him to Sicily, but they may have been Acarnanian too. The Boeotians sent to Malis for javelin men and slingers in 424. The Margianians, Letrinians and Amphidolians, peoples living in the border districts of Elis, who supplied 400 slingers who fought on the Lacedaemonian side in the battle of Nemea in 394 were also probably shepherds. It is uncertain whether the 300 slingers sent to join the army of Philip V in 219 by the Achaeans are native troops or mercenaries. The identity of the Attalid slingers at Magnesia in 190 is likewise unknown.

In the western Mediterranean Balearic slingers were famed for their skill. In 206 Mago recruited 2,000 of them on Minorca and sent them to Carthage. They are later found in Italy with Hannibal. The slingers sent by

Hieron of Syracuse in 216 to help the Romans against the Baliares presumably are not. Balearic slingers are found fighting later for the Romans, but the slingers fighting in Anthony's army in Parthia, and later against Caesar, were probably recruited in Greece.

Social and Economic Effects of War

The frequency of war in the Greek world, the comparative rarity of periods of extended peace and the readiness of Greek states to resort to war all combine to make it plain that war had far-reaching and significant effects upon Greek economic activity and social behavior. That much is beyond dispute, but defining the precise consequences of war for economy and society in the ancient Greek world is more problematic: the scarcity of reliable, or often in fact any, quantitative data on basic matters such as population numbers, age distribution or economic outputs limits the ancient historian mostly to broad-brush, even impressionistic descriptions. However, the trend in recent research is to strive for as much exactness as possible. Even if hard and fast numbers elude the historian, the broad limits and general counters of social and economic phenomena can be plausibly stated, and better efforts at more careful nuancing can always be made.

The problems involved may be illustrated by the universal practice of invading armies of destroying the crops and fruit-trees in enemy territory. Cereal crops could apparently be burnt but it is hardly ever possible to deduce what proportion of annual cereal production was actually destroyed,

nor is it known what reserves of foodstuffs from previous years' production a city had within its walls. That Mantinea under siege from Sparta in 386 expected to put up prolonged resistance because of a good harvest in the previous year (Xenophon, *Hellenica* 5.2.4) is a valuable piece of data, but it is not known how many mouths there were to feed or how much food was going to be given to each one. The same applies to the Spartan siege of the Peloponnesian city Phlius (380–379), which lasted twice as long as expected, 20 months instead of 10, because the besieged endured half-rations (Xenophon, *Hellenica* 5.3.21).

Another case in point is the destruction of olive trees, the other main food source in Greece besides cereals. In the later phase of his invasion of the territory of Corinth in about 390 during the Corinthian war, Agesilaus is said to have "chopped down and burnt any tree that was still standing" (Xenophon, *Hellenica* 4.5.10). This is rather journalistic exaggeration than literal truth. Even if the number of olive trees in the affected part of Corinthian territory is beyond guesswork, any estimate of the amount of hard labor needed to cut through the tough wood of an olive tree at the base (the only way to stop it producing fruit for some years) suggests that Agesilaus' army did not produce a treeless landscape. Even hacking off branches from trees to make bonfires is no small task and burnt olive trees regenerate and produce crops surprisingly quickly. So any quantitative estimate of how much Corinthian olive production was destroyed and how long it took for production to get back to normal is out of the question.

The broad picture though is true and important: warfare had heavy economic costs both in terms of material destruction from enemy action and of the resources, often very heavy, devoted to it. For example, in one rare case we know the cost of one fifth-century military operation—the siege of Potidaea (432–429). This cost the Athenians more than 2,000 talents—according to Thucydides (2.70), the same as almost three and half years of the annual income from the whole of Attica.

Athens, amongst the largest and certainly the wealthiest of Classical Greek city-states, had a reputation in ancient times for holding elaborate and costly religious festivals. It has been thought that this expenditure, together with that on payments to citizens for civic purposes, was detrimental to Athenians' efforts at waging war. However, the relative abundance of evidence from Athens allows for the conclusion, arguable or even plausible, that spending on war typically consumed the major part of

Athenian state expenditure. All indications are that while Athens led the way, such constant expenditure on fighting wars, and on the related matter of the ever-present expenses of improving and maintaining fortifications, was typical of any Greek city-state—within the limits of its resources.

The question has been much debated whether the costs of war created endemic impoverishment in the Greek world. What has been said above should indicate the limited possibilities of such a debate. It has been argued that the massive state expenditure on standing armies and constant wars in the Hellenistic Period was actually a stimulus to economic activity that should be offset against the enormous damage done. Whether this is plausible in any given case is a matter of balancing probabilities.

The same applies to larger questions such as the ability of Greek states to recover from losses of manpower in war. Estimates can be made of fertility rates, but it is also useful to bear in mind Herodotus' assumption (6.78–83), natural to him, that after 6,000 Argive adult males had been massacred after the battle of Sepeia (ca. 494), the next generation of Argives was willing and able to fight a war. It would take some elaborate argument to deny that Greek city-states accepted war as an unavoidable and even honorable part of life. The willingness of Greek states to fight wars confronts the historian in dealing with episodes where the odds are very heavily stacked against one side, such as Cleomenes III of Sparta against the Macedonians and Achaeans at the battle of Sellasia (222) or the Achaean League against Rome (146). Equally a challenge to the historian is explaining the readiness of the Athenians in 395 to enter into a major war against Sparta (the Corinthian War) within 10 years of their catastrophic defeat in the Second Peloponnesian War. If the writing of Greek history since Thucydides has largely centered on war, that is due to the facts of the case, not to any perversity on the part of historians. The society knew the costs of war, but was warlike.

Social Values and War

In Plato's dialogue *The Laws* completed at the end of his life (ca. 429–347), a Cretan speaker named Cleinias explains the purpose of laws in Cretan cities regulating physical training and military equipment: Cretan practices, he says, such as common meals, light-armed fighting, and the use of archery are all absolutely necessary because every state is by nature engaged in perpetual warfare against all others, and peace is only a fiction for undeclared war (*Laws* 1.625–6). This bleak view presupposes, as was in fact the case, that the social and political institutions of Greek states were fundamentally determined by their need to fight wars for security, freedom, or survival. Yet Greek states must not be thought of as militaristic in the sense of making war their sole or principal purpose. Cleinias states that human stupidity blinds people to the realities of war and only legislation by an inspired lawgiver ensures the kind of preparedness needed.

In any Greek scale of values, war is regarded as intrinsically destructive and harmful. Cults of the war god Ares are relatively scarce in Greece and always of minor importance in a state's ritual calendar. No one resorted to

war for its own sake and the benefits of peace (quiet enjoyment of prosperity, sons organizing their father's funerals, and so on) are a commonplace. Polybius (12.25k) censured the historian Timaeus (ca. 350–ca. 260) for stupidly putting a speech consisting of such stale clichés into the mouth of the Syracusan leader Hermocrates. To elaborate on such self-evident things in place of strategic and political issues was simply childish in a world in which war was always common and often unavoidable

Everyone knew that war brought death, suffering, and loss but Greek states did remarkably little to avoid it. In wars over disputed territory (the commonest kind of conflict) Greeks did not readily abandon the justice of their own claim. It follows that in Greek wars the other side is always thought of as being in the wrong. The hoped-for material gains from booty were important but the psychological drive to prove moral and physical superiority counted for more. Victory was proof of inherent good qualities and of divine favor.

A reputation as a good soldier, or even better, success in military leadership was the surest and commonest way to political power, prestige, and material rewards. Politicians who had no military record to their credit and who had to rely upon oratory in the assembly or the law courts were overshadowed by the military men. The Athenian Demosthenes (ca. 384–322), a civilian politician, had a long struggle to win public confidence: his slow rise to power can be contrasted with the 40 annual terms as *strategos* of the mediocre soldier Phocion. Yet in 338 Demosthenes, an elderly man of high political standing and considerable wealth, served in the ranks of the Athenian hoplites at the battle of Chaeronea. It was sheer common sense that the offices of state that carried military commands with them were of the highest importance. Accordingly, even a radical democracy such as Athens did not use the indiscriminate device of appointment by lot for its generals but kept to the practice of election.

There was no Ancient Greek term corresponding to the modern term “pacifism.” The principled rejection of war in all circumstances would have struck any Greek as wildly absurd. It was of course sensible to argue for peace in a given case when a war was too costly or unwinnable. The Athenian politician Eubulus (ca. 405–ca. 335), who managed the state's finances and astutely built up its resources, has been loosely and wrongly described as a “pacifist,” although his policy was for Athens to avoid unnecessary wars and to build up resources for when Athens had to fight a

necessary war. His policy was consistent in its aims with what Xenophon advocated ca. 355 in his treatise *Poroi* (*On the Revenues*), and no one has ever labeled Xenophon a pacifist. Greek literature, especially comedy, presents a great deal of examples of mockery of self-important young cavalymen and, in particular, of the boastful, spendthrift mercenary who was really a coward underneath. The resentment evident in such stereotyping was based on class-feeling, not antimilitarism as such. In contrast, later generations of Athenians sentimentally idolized the memory of the *Marathonomachoi*, those Athenians who had fought at Marathon (490).

The same Greek word *agathos* meant, according to context, “morally good” or “brave,” most commonly with reference to bravery in war. A person who failed to carry out his military duties in the right way could not be thought of as a good person. It is worth bearing in mind when evaluating the place of war in Greek social values that the philosopher Socrates, who of all ancient moralists had had the most rigorously defined system of ethics, was proud of his service as a hoplite in Athens’ wars at Potidaea and Delium.

Social War (357–355)

Causes

The Social War was fought by Athens against allies who defected from the Second Athenian Confederacy. The war gets its name from the Latin word for ally (*socius*).

The Second Athenian Confederacy was formed in 378/7 to protect the freedom of member states. Athenian policy in the 20 years after the Confederacy was founded placed increasing strain on the allies. The main outcome of the wars against Sparta (378–375/4, 374–371) was the expansion of Boeotia under Theban control (Xenophon, *Hellenica* 6.2.1). In the 360s Athens fought costly wars to recover Amphipolis and extend its power in the northern Aegean, as well as expropriating Samos (365). Athenian naval power had been challenged by the sudden appearance in the Aegean of a Boeotian navy, when Byzantium apparently defected (364). In 358 Athens had begun a war with Philip II of Macedon. Athenian allies had cogent reasons to question whether membership of the Confederacy was worthwhile. At the same time, Mausolus of Caria gave the rebels support, to extend his own power in the southern Aegean.

Course

In 357, two of the biggest states in the Confederacy, Chios and Rhodes, defected. They were joined by Cos and by Byzantium. In 356 an Athenian fleet of 60 triremes under Chares sent out against the rebels was defeated in a battle off Chios and more allies rebelled. Athens sent out more triremes under Timotheus, Iphicrates, and his son Menestheus, to bring Chares' fleet back up to 60. Under the command of these four, the Athenian fleet failed to prevent rebel attacks on loyal allies. When the rebels besieged the Athenian settlement on Samos, the four Athenian generals sailed to the Hellespont to blockade Byzantium. This drew the rebel fleet away from Samos in pursuit. The Athenian fleet turned back and in bad weather off Embata, Chares went against the decision of his fellow generals and led an attack. The others had to follow and the Athenian fleet was badly beaten.

Chares sent denunciations of his fellow generals to Athens and they were deposed. Desperate for money to pay his crews, Chares put his fleet at the disposal of Artabazus, a satrap in revolt from the Persian king. The Persian king responded by threatening to join the rebels with a fleet of 300 triremes. Chares was recalled and Athens had no choice but to make peace with the rebels in 355, acknowledging their departure from the Confederacy.

In the war Athens had been able to mobilize only relatively small fleets that were matched by the rebels in size and outclassed in battle. Athenian financial resources were soon exhausted.

Consequences

The Social War reduced the Second Athenian Confederacy to a small remnant. Athenian capacity and willingness for offensive action in the war with Philip were severely impaired. The politician Eubulus' policy of financial reform and rebuilding resources restricted military ventures abroad. Athens was badly placed in the struggle with an enterprising enemy in Philip.

Social War (220–217)

Causes

The Social War of 220–217 is so called because it was a war fought by an alliance, "social" in this sense being derived from the Latin word for ally (*socius*). The alliance was the panhellenic one established by King Antigonus III Doson of Macedonia, when he joined with the Achaean League against King Cleomenes III of Sparta (225). This alliance provided for joint defense under Macedonian leadership against an attack on any

member.

On the death of Antigonus Doson (221) the Aetolian League expanded its practice of raiding other states. Aetolian privateers using the recently acquired port of Pagasae in Thessaly attacked shipping indiscriminately. An Aetolian force in the Peloponnese attacked Achaëa and Messenia. Achaëa invoked the protection of the panhellenic alliance against Aetolia. The issue was whether Macedonian hegemony could check Aetolian depredations. In 219 the new Macedonian king, Philip V, aged 17 years, convened a congress of the alliance that declared war on Aetolia.

Course

In the first year of the war, Philip had to deal with threats to his northern frontier. The allies in the Peloponnese were inactive and the Aetolians won over Elis and Sparta. On a wider front, the Aetolians sacked the oracle shrine of Dodona in Epirus and the temples at Dium in southern Macedonia.

The panhellenic alliance seemed on the point of collapse but Philip reversed the situation in the winter of 219/18 by a rapid march from Macedonia down to the Peloponnese and, maintaining his speed of movement, dealt with the Aetolian forces there and made a lucrative pillaging campaign into the rich lands of Elis. He then improvised a fleet at Corinth and moved his army across the Corinthian Gulf to invade the heartland of Aetolia, overcoming the obstacles presented by the terrain and the Aetolians' capacity for guerilla warfare. He sacked and destroyed the Aetolian federal sanctuary at Thermon in retaliation for their resorting to this kind of warfare.

In the summer of 218, Philip made another rapid and unexpected movement through the Peloponnese to Sparta, which he knocked out of the war. After a diversion back to Macedonia to defend his frontier, Philip returned in 217 with a siege-train in his army and took by siege the key Aetolian-held city of Phthiotic Thebes in Thessaly. By this time, the Aetolians were ready to accept Philip's proposal for peace negotiations.

Consequences

The Peace of Naupactus (late summer, 217) ended the war on the basis that all participants should retain the territories they held at the time of the treaty. This meant that Aetolia had to accept considerable losses. Although

Philip's brilliant generalship and the proficiency of the Macedonian army reinforced Macedonian prestige, the war had shown that the Greek states in the alliance were slow to cooperate with their Macedonian hegemon. The Aetolians remained discontented and so readily turned to Rome to pursue their hostility to Macedonia when Rome intervened in Greece (First Macedonian War, 215–205). Other Greek states, including the Achaean League, were uneasy about Philip's increasing dominance and his expansionist policies, including his alliance with Hannibal (215). The Social War illustrates the fundamental weakness of institutional attempts to secure peace and cooperation among the Greek states.

Sogdian Rock, Siege of (327)

A fortified precipitous hill in modern day Tajikistan, where the rebel Oxyartes had placed his wife and daughters for safekeeping during Alexander the Great's campaign to subdue Bactria. In early 327, Alexander was determined to take the rock because it was the last secure refuge for his Sogdian opponents and the defenders had contemptuously rejected his demand to surrender, telling him to find winged soldiers as nothing less would trouble them. Alexander offered lavish rewards to the first men to scale the rock. About 300 with climbing experience scaled the steepest face of the rock, using tent pegs and ropes. They reached the summit above the enemy fort at dawn, with the loss of 30 men. Stunned, the enemy surrendered. Among the captives was Roxane, the beautiful daughter of Oxyartes and Alexander married her. The fall of the "Sogdian Rock" and the "Rock of Chorienes," ended Bactrian resistance.

Solon (d. ca. 560)

Solon, from a wealthy Athenian family, rose to prominence in Athens' war with Megara over Salamis in 600. He was archon in 594/3, implementing several major economic, political, and social reforms either then or soon afterward. These reforms were prompted by major tension and conflict over economic and political conditions in Athens. The reforms caused Solon to be credited with liberating the lower classes from indenture to the aristocracy. Solon allegedly left Athens after enacting his laws so they could not be repealed (Herodotus 1.29–33). He is reported to have visited Egypt and Lydia before his death ca. 560.

Marble bust of Solon, Roman copy, perhaps of a fourth-century Greek original. This idealized portrait represents later views of Solon as the father of Athenian democracy. Located in the National Archaeological Museum, Naples, Italy. (De Agostini Picture Library/L. Pedicini/Bridgeman Images)

Solon's legal reforms included the *seisachtheia* (shaking off of burdens), which forgave citizen debts and liberated the *hektemoroi* (sixth-parters), who had been indentured to give (probably) one sixth of their produce to their landlords, as well as freeing those who had been enslaved for defaulting on their debts. Immigrant craftsmen were granted Athenian citizenship. Solon also established a wealth-based division of social classes, placing the citizens of Athens in four categories based on economic status: *Pentakosiomedimnoi* (500 bushelers), *Hippeis* (horse-owners), *Zeugitai* (lower class), and *Thetes*. These classes became the basis of Athenian political rights, over time breaking the aristocratic hold on political power. He further switched the Athenians' currency from the Peloponnesian

standard to the Euboic-Ionic standard weight to encourage external trade. His reforms also banned the export of all Athenian agricultural goods except olive oil. Solon's laws mollified Dracon's harsh punitive measures, except in the case of murder, and created public lawsuits open to all citizens. Despite the apparent success of the reforms in the economic area, political unrest continued. Athens twice failed to elect an archon, Damasias held the office for twice as long as allowed, and Peisistratus became tyrant (561/60). However, despite the discontent of his contemporaries, by the end of the fifth century, Solon's reforms had been idealized by democrats as the foundations for Athens' fifth-century democracy.

Sparta

A city-state in the southeastern Peloponnese. Following territorial expansion in the Archaic Period, Sparta was a major power in the Greek world until the mid-fourth century, after which it irreparably declined. The Spartans were noted for their military prowess in infantry combat, which has been attributed to their unique social structure and educational system.

For the early history of Sparta, we are reliant upon highly mythologized later accounts, and the fragmentary evidence of Tyrtaeus. The city of Sparta was formed by the unification of four villages: Cynosura, Limnae, Mesoa, and Pitane. The village of Amyclae, which lay further to the south, was brought into this union later, sometime in the eighth century. Having

established control over the surrounding area, Lacedaemon, which comprised most of the southeastern Peloponnese, the Spartans next subjugated their neighbor to the west, Messenia. Ancient writers describe this expansion as occurring in the First and Second Messenian Wars, traditionally in the late-eighth and mid-seventh century, respectively. The term Lacedaemon may also refer to the city of Sparta.

Following the conquest of Messenia, the Spartans possessed among the largest territories of any Greek state. This abundance of land allowed the Spartans to establish and maintain a unique social system, which addressed both the ongoing threat posed by the Messenians and tensions within their own society. These tensions are apparent in the case of the *Partheniae*, who were dispatched from Sparta to found the city of Taras/Tarentum. Ancient writers, and the Spartans themselves, attributed their innovations to a single man, the lawgiver Lycurgus. The role played by this individual, and his very existence, is now a matter of debate. It is likely that the “Lycurgan reforms” were in fact incrementally introduced “renovations” of traditional practices that already existed within Spartan society. However, the end-result of this process, often called the “sixth-century revolution,” is reasonably clear. Making use of Sparta’s expansive territories, every Spartan citizen (or “Spartiate”) was granted a portion of land (*cleros*). This ensured that even the poorest Spartiate had the means to provide a regular contribution to a *syssition*—a dining-club, membership of which was a precondition of citizenship. This land may also have been intended to cover the costs associated with the *agoge*, Sparta’s communal upbringing, completion of which formed another precondition of citizenship. Thus, a Spartiate’s *cleros* allowed him to meet an effective property qualification for enfranchisement. Although wealth inequalities remained, all Spartiates were theoretically *homoioi*—“peers” or “equals.”

Remains of the Menelaion, a sanctuary of Menelaus and Helen, near Sparta. Menelaus was the legendary Spartan king at the time of the Trojan War, who fought to recover his wife, Helen. The site's legendary associations may have been inspired by the nearby remains of a Bronze Age palace, but the sanctuary itself does not predate the eighth century. The major building works visible today are from the early fifth century, the period of Sparta's greatest power. (Photo by Peter Londey)

A Spartiate's lands were worked by Helots, the conquered inhabitants of these territories, who occupied a position somewhere between slaves and serfs. Not all of those whom the Spartans conquered were so subjugated, however, and self-governing communities did exist in both Lacedaemon and Messenia. These communities of *Perioikoi*—"neighbors"—were obliged to follow Sparta's lead in foreign policy, and serve in the Spartan army, but were otherwise largely autonomous.

Another distinctive aspect of Spartan society was its system of government. Aristotle described Sparta as an example of the "mixed constitution," combining democratic, oligarchic and monarchic elements. In fact, at any given time Sparta had two kings, the scions of the Agiad and Eurypontid royal houses. The kings' formal roles were principally limited to serving as religious officials and commanders of the Spartan army. However, the kings were generally two of the most influential individuals in Spartan society, and could dominate Spartan politics. The kings were also automatically members of the *gerousia*, or council of elders, which

otherwise consisted of 28 men elected from those over 60 years old. The *gerousia* formed Sparta's senior court and also vetted legislation to be put before the Spartan assembly. The final major office of state, and likely the last to develop, was the board of ephors: five men, elected for a single year, who exercised a number of executive functions, such as calling out the army, receiving envoys, and chairing meetings of the Spartan assembly.

In the mid-sixth century, the Spartans made further territorial gains at the expense of their northeastern neighbor, Argos, capturing the border region of Thyrea in the "Battle of the Champions." However, following mixed results against their northwestern neighbor, Tegea, the Spartans and Tegeans came to a negotiated settlement. The Spartans went on to form numerous such alliances, creating the network of treaties which scholars call the Peloponnesian League. This enshrined Sparta's dominant position within the Peloponnese, particularly against challenges periodically made by Argos, and the internal threat posed by the Helots.

In the late-sixth century, under the leadership of the influential Agiad king Cleomenes I, the Spartans consolidated their position within the Peloponnese, inflicting a major defeat upon the Argives at Sepeia (ca. 494). They also began to intervene in the affairs of Greek states further afield, notably Athens, where the Spartans overthrew the Peisistratid tyranny (511/10). Unlike Athens, Sparta did not provide support to the Ionian revolt which precipitated Persia's invasions of the Greek mainland. However, owing to their preeminence among the Greek states, Sparta provided the commanders of the anti-Persian coalition, both on land and at sea. Thus, it was a Spartan admiral, Eurybiades, who commanded the Greek fleet at Salamis in 480, although the credit for that victory is generally given to the Athenian Themistocles. Similarly, the Agiad king Leonidas was commander at the battle of Thermopylae, and Pausanias, the regent for Leonidas' son, Pleistarchus, at the conclusive battle of Plataea. Although the latter was a victory, and the former a defeat, it was the battle of Thermopylae that above all served to cement the Spartan reputation for bravery and excellence in phalanx warfare.

In 465/4, in the aftermath of a damaging earthquake Sparta faced another significant Helot revolt, sometimes called the Third Messenian War. At the same time, the growth in Athens' power through its leadership of the Delian League created friction between Athens and Sparta. This flared into open warfare in the so-called First Peloponnesian War (460/59–445), a

precursor to the Peloponnesian War proper (431–404). The major contemporary historian of the latter war, Thucydides, attributed its outbreak to Sparta's fear of Athens' power. However, the most significant factor appears to have been the pressure placed upon Sparta by other members of the Peloponnesian League, such as Megara and Corinth, who felt more directly threatened by Athenian expansion and aggression, and expected Sparta to come to their aid. Sparta's repeated invasions of Attica were unsuccessful, and it was only when the Spartans gained Persian aid, at the cost of abandoning to Persian rule the Greek cities of Asia Minor, that the Spartan admiral Lysander was able to secure victory with the sea-battle at Aegospotami (405), and the subsequent siege of Athens by both land and sea.

The defeat of Athens brought Sparta to the peak of its power. However, the alliance with Persia which had been vital to that victory was temporary. The Eurypontid king Agesilaus II led a campaign into Asia Minor, but was forced to turn back by the emergence of a Persian-backed anti-Spartan coalition, against which Sparta fought in the Corinthian War (395–387/6). This conflict, and in particular the defeat of the Spartan fleet at Cnidus in 394, effectively ended Spartan ambitions to dominate both land and sea.

The peace that was imposed upon the Greeks by the king of Persia, ending the Corinthian War—the King's Peace—still sanctioned Sparta's role as the dominant power on the Greek mainland. This hegemony was short-lived, however. In 371, the Spartans were decisively defeated by the Thebans at Leuctra. The Theban victory was in part attributable to developments in infantry tactics, and the deficiency of Sparta's cavalry. However, a more fundamental weakness on the Spartan side was *oliganthropia*—lack of men. Theoretically, a Spartiate's property-holdings allowed him to meet the expenses which were a precondition of citizenship. Over the long term, however, progressive concentration of these property-holdings into fewer hands, which was a natural consequence of Sparta's system of inheritance, resulted in a progressive decline in the number of Spartiates. By 371, this number had fallen to ca. 1500, down from some 8000 in 480. The Thebans consolidated their victory by invading Laconia, and liberating Messenia from Spartan rule, a loss of land, resources, and manpower that ensured Sparta's decline as a major power.

Successive kings attempted to restore Sparta's fortunes. However, whether these attempts were based purely upon military conquest, or

grounded in social reform, they met with little success. Still, Sparta did maintain a powerful legacy. Already in the Classical Period, Sparta's reputation for its distinctive institutions, military excellence, and austere way of life fascinated other Greeks, and this fascination continued into the Roman period and beyond. Historians have used the term "Spartan mirage" to describe the distorting effect which the resultant myth-building has had upon our ability to understand the "real" Sparta. However, from antiquity to the present day, the myth of Sparta as the home of a warrior community, trained from infancy to embrace hardship and frugality, has arguably been far more influential than the historical reality.

Sparta, Attack on Tegea (Fetters, Battle of) (ca. 570)

Tegea, in southeast Arcadia, was widely regarded as the home of formidable warriors. The Spartans' attack on Tegea, known as the "Battle of the Fetters," which occurred about 570, is presented in the ancient literature as a lesson in hubris and a rare defeat for Sparta.

At this time, the story goes, the Spartans were hoping to conquer Arcadia. When they consulted the oracle at Delphi they were told they would not subdue all of Arcadia, but the Pythian priestess appeared to give them a positive response in relation to the city of Tegea, saying: “I will give you Tegea to dance in with stomping feet and her rich plain to measure out with rods” (Herodotus 1.66). Sparta was now so confident of victory that its army took along its own fetters, with which to enslave the Tegean population. But they were defeated and were made to wear the chains themselves and to measure out the Tegean plain, not as victors distributing spoils, but as enslaved laborers. The fetters were later displayed by the people of Tegea in the Temple of Athene Alea. In about 550, after 40 years of hostility, Sparta and Tegea came to terms. Tegea’s resistance earned it alliance as an independent state, rather than as a subjugated people like the Messenians. Thereafter, Tegea served as a relatively consistent ally of Sparta.

Sparta, Campaign against Olynthus

Sparta campaigned against the Chalcidian Confederacy in the geopolitical context of northern Greece’s power vacuum after King Archelaus of Macedon’s death in 399, which had also attracted Thebes, Athens, and Olynthus. The King’s Peace (387/6) also emboldened Sparta to act with impunity. In 382, the Spartan assembly and Peloponnesian League congress responded positively to delegates from Acanthus and Apollonia who stated that Olynthus’ Chalcidian Confederacy was coercing their *poleis* to join it. Additionally, King Amyntas of Macedon complained to the Spartans about a land dispute with Olynthus.

A 10,000-man expedition was voted, with some Peloponnesian League member states innovatively contributing money rather than soldiers. An advance group of 2,000 was sent out under the Spartiate Eudamidas and his

brother Phoebidas. The latter took over Thebes on his way north on a pretext of Theban disloyalty. Agesilaus' brother Teleutias then took most of the 10,000 soldiers to Chalcidice, fought near Olynthus, and was killed. Agesipolis I took over the operation with additional soldiers and died shortly after the battle of Torone in 381. The harmost (governor) Polybiades then replaced Agesipolis. He blockaded Olynthus until the Olynthians surrendered in 379 and became a subordinate ally of Sparta.

This victory accompanied Sparta's humbling of Phlius, garrisoning of Thebes, and hobbling of Corinth and Argos. The Spartans rearranged their alliance system into ten parts, with Sparta's new Thraceward allies composing one part.

Sparta, Wars in Arcadia (370–362)

Sparta's longstanding hegemony in the Peloponnese weakened following crushing defeat at the battle of Leuctra (371). After the ratification of peace which granted full autonomy to all Greek cities, factions within Arcadia began reviewing their traditional allegiances. The Mantineans provoked the Spartans by building a wall and then intervening in the Tegean civil war (370). In response, the Spartans sent an army under Agesilaus II into Arcadia to quell the growing rebellion. As the newly formed Arcadian League grew, help came from Thebes, which invaded the Peloponnese for the first time. But afterward, with the Thebans gone, the Spartans invaded Arcadia again and this time defeated the Arcadians, Argives, and Messenians in the "Tearless Battle," in which allegedly the Spartans suffered no loss at all. Over the next six years, territorial skirmishes erupted across the Peloponnese. The Arcadians were squeezed by the Achaeans to the north and by the Eleans at Olympia, but repelled another Spartan invasion.

After years of combat terrorized the region, disagreements split Mantinea from the Arcadian League (363–362). In response, Thebes sent an army in attempt to reestablish control in the Peloponnese, leading to the battle of Mantinea (362). Thebes won the battle, but lost Epaminondas; as Xenophon comments, Greece was left more confused and disturbed than before. The ultimate beneficiary was Philip II of Macedon.

Spartolus, Battle of (429)

A land battle fought in 429 between Athens and Chalcidian rebels. Thucydides provides a contemporary record, while Diodorus’ brief account claims (almost certainly incorrectly) that the Athenian force was half the size given by Thucydides (2,000 hoplites and 200 cavalry). The Athenians, attempting to bring the Chalcidice back under control, ravaged Spartolus’ territory, hoping that pro-Athenians would surrender the city. Instead, the citizens, reinforced from nearby Olynthus, marched out. The Athenian hoplites were victorious but their cavalry and light troops were defeated. Reinforced by more peltasts from Olynthus, the Chalcidians harried the Athenians with javelins. The Athenian hoplites, slowed by their armor, were unable to drive them off and ultimately broke and fled to Potidaea. In a formal recognition of defeat the Athenians requested an armistice to recover their dead—all three *strategoi* (generals) and 430 men. The battle proved a temporary setback to Athens’ attempts to pacify the area and is a good example alongside Pylos and Lechaeum of the vulnerability of hoplites to good cavalry and light troops.

Speeches, Military

Ancient historians commonly include in their narrative reports direct speech of addresses by politicians and military commanders. Serious and careful historians, Thucydides (1.22) and Polybius (12.25A-B), state that they went to considerable pains to give the substance of such speeches, indicating they attempted to report only speeches actually given. Neither claimed to report speeches with word-for-word accuracy (which was impossible and unimaginable under ancient conditions). The degree of fidelity that they attained in any given case is open to discussion. In contrast, historians with lower standards of accuracy were regarded as being too free in making up speeches that suited an occasion and showed off the historians' rhetorical talents (a charge leveled by Polybius against Timaeus).

Speeches pose a special problem in the interpretation of ancient historical writing. A particular aspect of this has been a focus in recent scholarship on commanders' speeches before battle, such as Pagondas and Hippocrates at the battle of Delium (Thucydides 4.92, 95–6); Nicias at Syracuse (Thucydides 7.61–9); Thrasybulus at the battle of Munychia (Xenophon, *Hellenica* 2.4.13–17).

On one side, it has been argued that surrounding noise and the limitations of the range of the human voice make it impossible for commanders to have delivered speeches of some length, as opposed to a few words of encouragement. It follows from this that the prebattle speeches in ancient historians must be regarded as a type of conventionalized fiction.

The other side of the argument emphasizes that ancient historians often made it plain that commanders moved along their troops as they gave these speeches before battle: that is, they gave much the same speech at different places to reach the ears of as many troops as possible. Also relevant are the power of the rhetorically trained voice (common among the ambitious among the elite) and the psychological advantages of a commander voicing clearly and confidently what his side was fighting for. That troops expected

commanders to deliver such exhortations on the point of joining battle is well attested. Parallels from mediaeval and early modern warfare provide some support for giving speeches before battle.

This controversy points to the value of raising questions about what the evidence from antiquity actually proves. Careful and minute attention to what ancient sources say is needed to advance the discussion, and a clearer understanding of an ancient practice should emerge. However, showing that speeches were delivered before battle is not the same thing as proving that every such speech in ancient historical writing is a credible report of something factual.

Spercheius Valley

The Spercheius is a major river of central Greece, flowing east about 75 kilometers into the Malian Gulf. Since antiquity, silting of the gulf has moved the river mouth about 14 kilometers eastward, so that the modern highway from Athens to Thessaloniki crosses a plain that was formerly underwater. The ancient towns of the valley were all, as was typical in Greece, on the hills on its fringes. The lower part of the valley was occupied by the Malians, with their two main cities, Trachis (later Heraclea Trachinia) and Lamia on the south and north, respectively. Higher up, the southern side of the valley was home to the Oetaeans and the Aenianians (the names

sometimes seem to be used interchangeably), while the Dolopians occupied the hills to the north. Much of the population in the upper valley may have lived in villages; the only substantial town on the southern flank was Hypata in Aenis, while the main Dolopian town was Ktimene. These were minor groups, who rarely played a significant historical role. Collectively they generally fell in the Thessalian sphere of influence. They medized in 480; objected to the foundation of Heraclea Trachinia in 426; and were part of the Aetolian League for much of the Hellenistic Period. In 174 it was the Macedonian king Perseus putting down a revolt of the Dolopians that provided the pretext for the Romans to enter the Third Macedonian War. But in the regional politics of central Greece they played a role, with the Malians, Dolopians and Aenianians between them providing a quarter of the tribal membership of the Delphic Amphictyony.

Sport and War

The ancient Greeks believed that sport had practical value for those who fought in the hoplite phalanx. Admittedly the standard events of athletic *agōnes* ("contests") did not rehearse the full skill set which hoplites required. Hoplites, for example, did not engage in boxing bouts or throw discuses at each other. This was the case too with the javelin-throwing of the pentathlon. In this event a sportsman tried, not to hit a target, but to throw his *akon* ("javelin") the greatest possible distance. Hoplites, by contrast, used

a heavier spear, called a *doru*. In the pitched battles of the Classical Period they did not throw it. Instead they used it to stab their opponents in hand-to-hand combat. Indeed the only event that practiced what hoplites actually did was the footrace in armor. Runners who ran it wore a helmet and greaves and carried the hoplite's distinctive round shield. In battle hoplites regularly did run, when their phalanxes were within 50 meters (55 yards) of each other. They also ran away, when they felt that their side had been categorically defeated. Athletes and soldiers thus did employ different skills in their respective contests. But there were many Greeks who still judged athletics to be valuable for preparing citizens for fighting as a hoplite.

The Spartans thought that this was the case. Some ancient historians have argued that this *polis* actually disliked athletics. But this argument relies on a misreading of two passages only (Aristotle, *Politics* 1338b9–13; Tyrtaeus 12.1–2, 10–14 [West]). It ignores too a lot of other evidence that shows a strong commitment among the Spartans to athletics. For example, their high estimation of athletics saw their *polis* both display public lists of its sporting victors and allow individuals to make a wide range of dedications concerning their sporting successes. Thus we find in the sanctuary of Athena Chalcioecus many fragments of prize *amphorae* from the Great Panathenaic Games and inscriptions listing the victories of local sportsmen (e.g. *IG V* 1.213). The Spartans too publicly honored Olympic victors, even if in an idiosyncratic way: they allowed them to join their king's bodyguard in battle. These exceptional “craftsmen of war”—to quote Xenophon's *Constitution of the Spartans* 9.5—had long had athletic contests and athletic training for boys and men. This was done especially as part of the *agoge* or state-organized education of Spartan boys, whose principal aim was to create its fearsome hoplites. Once part of the Spartan army, they were legally obliged to practice athletics on campaign.

The stadium at Delphi. Originally built in the fifth century, the remains visible today are from the second century CE. The starting blocks can be seen in the foreground. Although many Greeks believed that athletics provided useful preparation for war, running, especially the race in armor, was the sport most practically linked to hoplite combat. (Photo by Iain Spence)

Yet, in contrast to the other Greeks, the Spartans may have practiced boxing and the *pankration* among themselves. But they usually avoided competing in these two “heavy” events at games, because they apparently disliked the fact that those who competed in them could concede defeat voluntarily. Conceding defeat clashed with the classical ideal of Spartan *arête* (“courage”). This virtue required a hoplite either to stand his ground or be killed in action. The avoidance of such events suggests that the Spartans believed that athletics could do more than prepare boys and men physically for war: it could also socialize them into the values of the battlefield.

The Classical Athenians famously boasted that their hoplites did not need education and practice in *ponoi* (“toils”) to be brave in battle. Their *arête*, they boasted, flowed naturally from their fine way of life, fine character and fine birth (QQ 36). For most of the Classical Period Athens thus neither organized nor financed military and athletic training for its hoplites. They may have been proud of their amateur hoplites. But this does not mean that they denied the practical value of athletics for military service. Xenophon has Socrates castigate an Athenian youth for being out of shape: one needs *euexia* (“physical fitness”) for the *agōn* (“contest”) of battle just as much as an athlete does for the *agōnes* of the Olympics. Being unfit,

Socrates continued, resulted in those facing “the dangers of war” being killed, captured, or forced into acts of cowardice. His concern for the fitness of hoplites was easy to understand: they had to carry armor and weapons which ranged in weight from 15 to 30 kilograms (33-66 pounds), fight for up to a few hours, when the phalanxes met, and spend most of the rest of the day maneuvering for the actual battle and in a subsequent pursuit or retreat. Plato’s Protagoras said the same thing as Socrates when outlining how each of the three disciplines of education turned boys into courageous men: athletics did so by making sure lack of physical fitness would not cause the young man to be cowardly in war.

Phalanx warfare was bloody and fairly deadly. For a long time there was a simple reason why the Athenians got away with not training their hoplites for it: with the exception of the Spartans, the enemies of the Athenians did not have state-subsidized military training either. The resulting equality of amateurism drastically reduced the dangers of battle for both sides. However, this balance disappeared in the course of the fourth century, because others started to copy the Spartans. The first to do so were the Thebans. In response to Sparta’s repeated invasions of their state in the 380s they created a corps of highly trained hoplites, called the Sacred Band. At the battle of Leuctra, in 371, this band crushed the Spartan army. This quickly led to the unraveling of the Peloponnesian League and the liberation of Sparta’s Helots.

With such a spectacular end to Spartan hegemony, others understandably followed the Thebans in introducing state-sponsored training for soldiers. One to do so was Philip II of Macedon. After his accession to the throne in 359 this king copied the Thebans by imposing a degree of training which no Greek army ever acquired. In only two decades he turned Macedonia into a major military power and then into Greece’s new hegemon with his victory at the battle Chaeronea in 338, where he defeated the combined armies of Athens and Thebes.

This defeat belatedly pushed the Athenians into abandoning the amateurism of their hoplites. In 336, an Athenian politician thus proposed a law “concerning the ephebes.” This took the underfunded and uncoordinated exercises of some 18- and 19-year-old Athenians and transformed them into a state-sponsored training-program for hoplites. For each recruit in this new *ephebeia* (“cadetship”) Athens provided hoplite-equipment and accommodation. First-year ephebes were stationed in the port of Athens,

where they were taught “infantry-fighting, archery, javelin-throwing and catapult firing,” while second-year cadets patrolled Attica and manned its guard posts. Some elements of this state-sponsored training-program were clearly modeled on Spartan practice. What is often overlooked in the Athenian *ephebeia* is its athletics program. For first-year ephebes the Athenians appointed, not just military teachers, but two athletics teachers (*IG II²* 585.9–11). It also obliged each of the units of ephebes to compete in the athletic team event of the torch race at three of the state’s major games.

Stasis (Civil Strife)

Stasis, or internal strife, was a reasonably common (and feared) occurrence within Greek city-states. Confusingly for modern readers used to the concept of *stasis* as either a state of equilibrium or a pause where life or functions are suspended, the Greek term is almost the opposite. In ancient Greece, “*stasis*” was generally used to describe internal conflict beyond the normal cut and thrust of political life and is not applied to conflict between states. *Stasis* involved varying levels of dysfunction within a city, ranging from internal paralysis up to and including civil war. It does sometimes, though, also imply an evenly balanced struggle, with neither side powerful enough to win, which is presumably why the modern term developed as it did. The most famous description of *stasis* is Thucydides’ description of the

civil war in Corcyra in 427 (Document 9).

As might be expected, *stasis* existed in all periods of Greek history. Its earliest recorded manifestations are the aristocratic feuds common during the Archaic and early Classical Periods. In the Classical Period and later it was generally between opposing political groups, especially oligarchs and democrats, although sometimes aristocrats and democrats. However, Greek politics had a strong personal flavor and it is important not to automatically consider the factions in modern ideological terms—especially in the early periods. In these cases, although clashes could be over policy matters, this was often the result of interpersonal or family quarrels. The policy issues could be incidental—resulting from the interpersonal conflict rather than being its cause. For example, Aristides, after opposing his bitter rival Themistocles on a matter of advantage to Athens, is supposed to have lamented that Athens would never be safe while both he and Themistocles were alive.

However, there could be ideological aspects, especially in the cases of *stasis* from the fifth century onward. While Thucydides' history of the Second Peloponnesian War (431–404) portrays the war as a contest for power between Athens and Sparta, he also identifies the conflict between democracy and oligarchy as an element in the hostilities.

The early aristocratic clashes were between families or clans contesting for power. As is generally the case, the best-documented examples are Athenian. The earliest was the faction fighting which led to the reforms of Solon in the early sixth century. This was rather unusual for the time as later writers saw this as involving strong economic and class elements. At the same time, or perhaps influenced by and influencing, the aristocratic power struggles, economic grievances among the general population added to the tension.

Herodotus' account of the aristocratic families post Solon identifies three broad factions. None was powerful enough to achieve power for long and the period down to Peisistratus' third tyranny ca. 545 (and beyond) is one of shifting alliances as the clans jockeyed for power. The result of this *stasis* was the tyrannies of Peisistratus and later his sons. Tyranny was a reasonably common product of *stasis* and in these cases the element of popular support, perhaps sometimes generated by frustration with the continual *stasis*, was what allowed an individual to break the cycle—at least for a while.

One of the features of *stasis*, which made it a particularly feared condition, was violence. This could range from street fights between opponents, to assassination and civil war. The passions aroused in serious *stasis* could be great and the massacre of opponents, even those taking sanctuary in temples, did occur. The Athenian politician Ephialtes was assassinated during his struggle to reduce the power of the conservative and aristocratic Areopagus, but this seems to have been the only violence involved. Conversely, the murder of opponents was a feature of both oligarchic regimes in Athens in the end stages of the Second Peloponnesian War. This was especially so of the Thirty Tyrants (404–403). Massacres of political opponents are also attested, for example, at Aegina (ca. 490), Corcyra (427), Argos (417), Corinth (392)—which Xenophon particularly condemned for its brutality and disregard for religion, as it was perpetrated during a religious festival and some victims had sought sanctuary in temples—Cynaetha (220s), and Sparta (220 and 189). In 184, Philip V blamed internal faction fighting in Maroneia for a massacre he had himself instigated.

Another feature of *stasis* was resorting to outside assistance to defeat an internal enemy. Greek history is full of examples of groups or factions within a state calling in an external power to assist in their internal power struggle. The oligarchs at Epidamnus attacked their own city with the aid of local tribes—the democrats inside responded by appealing first to Corcyra and then to Corinth. The Peisistratidae at Athens were expelled with Spartan assistance and soon after Isagoras also, but less successfully, called in the Spartans to counter his rival Cleisthenes' popular support. The case of Cleisthenes and Isagoras also demonstrates another feature of the earlier, aristocratic, *stasis*—gaining the decisive advantage by securing mass support.

The reasons why *stasis* was feared are clear: the breakdown of government and social and/or religious conventions, the use of violence (in some cases extreme), and the involvement of external powers. Despite this, it was not uncommon in Greek states, particularly under the stress of warfare.

Stratagems

While ancient authors emphasize the moral superiority of fair and open combat, cunning stratagems were widely admired. Stratagems include any kind of tactic designed to catch an enemy unaware or off-guard, such as ambushes, feints, tricks, night attacks, and other ruses. Ambushes feature prominently in Homer’s *Iliad*, and such practices continued throughout the Classical and Hellenistic Periods. Celebrated examples include the Athenian general Demosthenes’ sneak attack on an unsuspecting camp of the Ambraciots in 426, and the destruction of Mycalessus by a band of Thracian mercenaries in 413. In both cases, so many were killed that the historian Thucydides counted it amongst the worst disasters to befall any combatant in the Peloponnesian War.

Ambushes, surprise attacks, and other kinds of deceptions were typically employed by a combatant who faced a superior enemy, but even a strong force would be eager to inflict maximum casualties on an enemy with minimal risk of loss to themselves.

Strategy

Although some modern historians of antiquity use “strategy” and “tactics” interchangeably, “strategy” (from the Greek verb *strategeo* “to be a general/lead an army”) is properly the high-level planning of wars or large scale military operations. Similarly, “tactics” (from the Greek *tasso* “to place/arrange or set in order”) is properly the disposition and maneuvering of troops (or ships) on the way to, from, and on the battlefield. Strategy is the plan prepared at the strategic level of conflict, while tactics is the plan prepared at the tactical level of conflict. These two levels of conflict have been used in military theory, and historical writing, for a very long time, and still form the usual basis of analysis by most modern historians of ancient conflict.

However, since the late twentieth century, in the west at least, modern military theory has recognized three levels of conflict. These are, in descending order: strategic, operational, and tactical. These are not discrete levels as there is some overlap, particularly between the lower end of the strategic level and the upper end of the operational level and between the lower end of operational level and the upper end of the tactical level. The operational level had been identified and incorporated into Soviet military doctrine in the 1920s but was really only accepted in Western theory in the last quarter of the twentieth century.

Ancient warfare was generally less complicated than modern warfare—in traditional hoplite warfare, for example, conflict often involved a single pitched battle and was therefore essentially fought at the tactical level. In

addition, the lack of detailed records often means that identifying planning in antiquity can often only be done by examining what happened and then estimating the original intent. This is subject to risk (plans often have unintended results or consequences), especially at the strategic and operational levels of conflict. Despite this, the three-level model can be a useful analytical framework for ancient conflicts, especially for larger ones like the Peloponnesian Wars or Alexander the Great's conquest of Persia.

At the risk of simplifying modern theory (especially at the operational level) the strategic level of conflict (sometimes also called the "grand strategic" level) operates at the state level. This is exemplified by the allied decision in World War II to place the main effort on defeating Germany before Japan, or by Pericles' "island policy" adopted as the Athenian strategy for fighting the Second Peloponnesian War (see below).

The operational level is subordinate to the strategic level and is best explained as campaign level. Modern examples include Gallipoli and the Battle of Britain; ancient examples include the Sicilian Expedition during the Second Peloponnesian War or Alexander the Great's "naval" campaign against Persia (which involved avoiding naval battle and capturing the Phoenician home ports of the navy).

The tactical level of conflict is subordinate to the operational level and operates at the lower or battlefield level. Examples of this are the way the Thebans disposed and then maneuvered their army at Leuctra, Alexander the Great's plan and execution at Issus, Granicus, and Gaugamela, or the differing plans and maneuvers of the opposing Athenian and Peloponnesian fleets in the initial engagement in the Corinthian Gulf in 429.

In modern theory, the strategy for a conflict is set at the state level, by the civilian and military leadership. This forms the overarching framework for military planning. So, planning at the operational level is designed to achieve the strategic aims, while tactical level planning achieves the operational level aims.

As noted, ancient conflict was often shorter and significantly less complicated than modern conflict and in many cases the focus was on the tactical level. This is not surprising as ancient Greece had nothing like the modern staff or planning systems or the training institutions to prepare people for them. Military training in the ancient Greek world was very limited. When it did occur it was basically at soldier or sailor level and restricted to practicing battlefield maneuvers in formation. While officers

clearly learned from maneuvering their troops or ships in this way, most military training at the officer level was from on the job experience.

Military manuals did exist, but were generally tips or stratagems from experienced practitioners with no recognition of any formal planning process. There is, however, an informal recognition of factors which need to be taken into account at the tactical level, which in conjunction with professional mastery (and natural ability) would help produce sound plans—for example, Xenophon's fourth-century manual, the *Cavalry Commander*.

Despite this, Greek commanders clearly did not simply hope for the best but went through some sort of planning process. For some officers, a mixture of natural ability and considerable practical experience led to highly effective plans. The difference between their process and a modern officer's is that the Greek commander lacked a formal "appreciation process" to aid their planning (in terms of both speed and ensuring no factor is missed), and to some extent standardize it. While the ancient planning process would often be a mental analysis by the commander alone, it might involve a discussion by a group of commanders, such as before Marathon in 490 or by Alcibiades, Nicias, and Lamachus in Sicily in 415. In these cases the decision might be taken by means of a vote (sometimes, as in Sicily, influenced by the prestige and status of the individuals) or, as at Marathon, a vote reinforced by a rotating command system. Under a monarchy, or where there was a single commander, this could involve a discussion between the commander and his senior contingent commanders. Although no doubt influenced by literary embellishment, the differences of opinion between Alexander the Great and Parmenion before Granicus and Gaugamela provide an example of this type of planning.

The Second Peloponnesian War provides a good example of fairly sophisticated planning at all three levels of conflict—and the difficulty of implementing a long term plan in ancient Greek warfare. At the start of the war the two sides had clear strategies. The Peloponnesian League, led by Sparta, simply followed the tried and tested hoplite strategy—march into the enemy's territory, ravage the crops and wage a pitched battle against them when they came out to defend. If they did not defend, the invader left with a moral victory and came back the next year to repeat the process until the enemy came to terms.

The Athenians, however, were persuaded by Pericles to adopt a different strategy—the famous "island policy." Under this, the Athenians were to

avoid major land clashes with the Peloponnesians and focus on preserving the empire which would provide them with their necessary food supplies. It also envisaged (possibly from the start, perhaps in response to unrest when the Athenians observed their land being ravaged) a limited defense of the Attic *chora* (agricultural hinterland) by cavalry, and amphibious raids on the Peloponnese. The intent was clearly to outlast the Peloponnesians who would then come to terms based on the status quo at the start of the war.

This overarching strategy provided the framework for the initial operational level campaign against the Peloponnese. This was predominantly a naval operation, maintaining naval supremacy to enable protection of the empire, blockading the ports of Spartan allies such as Corinth, and conducting amphibious raids on the Peloponnese. The war lasted from 431–404 (with a short period of “peace” from 421–413 during which military action proceeded in various theaters, without any direct clash between Athens and Sparta) and saw various changes to the strategy. The Spartans identified that they could not win using the traditional strategy and instead aimed to weaken the Athenian Empire—or at least those parts of it they could reach by land. This led to the campaign in the Chalcidice (424–422) and ultimately, after Athens was fatally weakened by its Sicilian disaster (413), to alliance with Persia and a strategy of destruction of Athenian naval power as a means of imposing a blockade and starving the city into surrender.

On the Athenian side, Pericles’ plan proved too defensive for many and various attempts were made to win the war by adopting a more offensive strategy. This first involved an attempt to neutralize Boeotia and therefore weaken the Peloponnesian League and later an attempt to dominate Sicily and use its resources against the Peloponnesians. Ultimately, the Spartan strategy prevailed, although Thucydides’ famous analysis is that the Athenians could have won if they had stuck to Pericles’ original strategy.

Successors (*Diadochoi*), Wars of (322–301)

The Wars of the Successors were a series of conflicts that occurred in the Macedonian Empire between 322 and 301. Following the death of Alexander the Great, the Wars took place in four distinct phases.

The First War arose in 321 after the Regent of Macedon, Perdiccas, was suspected of facilitating a power grab. In response, a coalition was formed against Perdiccas that included Antipater, Antigonus, Craterus, Lysimachus, and Ptolemy. Conflict ended in 320 after the death of Perdiccas.

The Second War occurred after Antipater’s death in 319. Cassander, Antipater’s son, initiated hostilities against Polyperchon in Greece. In Asia Minor, Antigonus fought Eumenes, while simultaneously aiding Cassander’s cause. In 317, Cassander expelled Polyperchon. By 315, Eumenes was captured and executed.

Fear of Antigonus’ power compelled Cassander, Lysimachus, and Ptolemy to unite against him in 314, beginning the Third War. Antigonus made peace with this alliance in 311, while focusing eastward on Seleucus.

The Fourth War began in 308 once Antigonus and his son Demetrius resumed hostilities against Cassander in Greece and Ptolemy in Cyprus. Hostilities ended with the battle of Ipsus in 301. Antigonus was killed, his army destroyed, and Demetrius forced back to Greece.

Surrender

In Greek battle, there was no certainty of clemency for the vanquished. Some religious principles offered the defeated a degree of protection, but it was largely a decision for the victors to decide who lived, died or were enslaved. However, there were often practical issues at play, such as political considerations, the possibility of reprisals if prisoners were maltreated, and the opportunity of ransom.

Although the victor had the advantage, there was a general expectation that the victor would act honorably. There are many instances of formal terms being agreed before surrender, particularly during a siege, where both parties had more to bargain with, as the outcomes were less certain than in the field of battle. The defeated inhabitants of Plataea threw themselves at the mercy of the Spartans. Thucydides (3.58.3) has them say, “we surrendered to you voluntarily, stretching out our hands as suppliants, and Hellenic law forbids killing in these circumstances.” Earlier Herodotus gives a number of examples of successful supplications. Sometimes surrender (or refuge) could be sought through a strong third party. For example, Themistocles successfully sought protection from Admetus, who agreed to offer him protection against the Athenians.

The most formal form of surrender involved *asylia* (asylum). Scholars have noted that the concept is linked to the derivative verb, *sylao*, denoting the process of “seizure” or “pillage.” *Asylia* is protection against this. Suppliants in conflict not only enjoyed the protection of the deities connected with the altar, sanctuary or temple at which they may have

sought asylum, but Zeus, in his aspect as Zeus Hikesios, carried out the specific role of protector of all suppliants seeking *asylia*. Greek victors were also mindful not to abuse a suppliant lest they invoke what was called “the vengeance of Neoptolemus,” after the fate of the Greek by that name who, for having impiously slaughtered the Trojan king, Priam, at a hearth altar, was killed in retribution at Apollo’s altar in Delphi. Xenophon not only applauded the Spartan king Agesilaus’ pious regard for suppliants, but he denounced Critias’ impious seizure of Theramenes at an altar (Document 13). Although instances of the abuse of suppliants exist, there are many more cases in which their rights were respected.

Wealthy individuals could surrender in the hope of being ransomed. Examples in which the opportunity to profit from a rich captive is thrown away are usually confined to the most bitter of conflicts, in which the hatred of the enemy overrode possible financial and diplomatic gain. As the Athenian general, Nicias, reminded his foe, Gylippus, in 413, “all men are subject to the fortunes of war” (Plutarch, *Nicias* 27). Nicias’ own record of mercy for captured Spartans and his emotional entreaty moved Gylippus, the Spartan commander at Syracuse. He ordered that the Athenians be given quarter. But Plutarch goes on to explain that, “the order was passed along slowly, so that the number of those killed exceeded those spared.” Later, the Syracusans agreed that, while most of the Athenians’ allies would be branded on the forehead and sold into slavery, the hated Athenians themselves would suffer an even worse fate. They were worked to death under appalling conditions in the stone quarries of Syracuse. Despite Gylippus’ clemency and the high ransom that the Syracusans would have received for the two captured Athenian generals, Demosthenes and Nicias, these men appear to have been executed and deliberately dishonored by having their mutilated bodies cast outside the city gates as carrion.

But more often than not, the conditions of surrender were upheld. There was a general expectation among Greeks that in local conflicts, the honor of the victor in adhering to the terms of surrender could be relied upon, but when it came to war with non-Greeks, duplicity was to be expected. A notable example was the murder of the Greek captains of the Ten Thousand by the Persian satrap, Tissaphernes.

Surrender was certainly a more honorable outcome than flight or desertion. There are jibes in ancient verse aimed at those who returned from battle without their shields—that is, having discarded them so that they

could run away unhindered. At Athens discarding a shield was classified as a crime, resulting in disenfranchisement. But it was not just a matter of cowardice, as the interlocking shield is also a key element of the phalanx and its loss, therefore, compromises the strength of the fighting unit. The romantic view of the Spartans' attitude to surrender is that there was too much shame to countenance it. A Spartan mother tells her son to return either with his shield or on it (Plutarch, *Moralia* 235a, 241f). But the situation was not that simple. The downside in Sparta of having a very small military elite was that these individuals were far too valuable to the society to lose. Therefore, we see the Athenians, "to the surprise of the Hellenes" negotiating the surrender of 120 Spartiates trapped on the island of Sphacteria near Pylos in 425 (Thucydides 4.38–40).

Sybaris/Thurii

The Achaean colony of Sybaris was once the wealthiest and most powerful city in Magna Graecia. The destruction of Sybaris by Croton in 510 ended Sybarite dominance and ushered in a period of Croton's supremacy. Several unsuccessful attempts were made to refound the city until the intervention of Athens in 444/3 and the panhellenic colony of Thurii was founded.

Sybaris expanded its territory to the Tyrrhenian Sea with the foundation of Poseidonia (600), Laus, and Scidrus (dates uncertain). In the sixth century,

a coalition with the Achaean colonies of Croton and Metapontum led to the conquest of Siris, and the absorption of this *polis* into Sybarite territory. By the middle of the sixth century Sybaris controlled a large territory, supposedly ruling over four tribes and 25 *poleis* (Strabo 6.1.13).

Traditionally, the destruction of Sybaris in 510 was attributed to a conflict between Telys, the tyrant of Sybaris, who ousted 500 aristocrats, and Croton, which provided refuge to these exiles and refused to return them (Diodorus 12.9. 2–4). After the destruction some citizens sought refuge in Laus and Scidrus, but others remained at Sybaris, which became a dependency of Croton.

Several attempts to refound the city were prevented by Croton. The Sybarites even appealed to Hieron I of Syracuse to help in their plight. In 453 Sybaris was refounded but a few years later the Crotoniates expelled the inhabitants. The Sybarites then requested assistance from the Spartans and the Athenians. In 446/5 the Athenians sent settlers, including Peloponnesians, to Sybaris but a dispute between the original Sybarites and the new colonists led to either the execution or expulsion of the Sybarites. In 444/3 the Athenians founded Thurii on a portion of Archaic Sybaris and invited other *poleis* to send settlers, creating a panhellenic colony (Diodorus 12.10–11).

Shortly after its foundation, Thurii fought with Taras over Sirite territory, resulting in the foundation of Heraclea in Taras' name. In the fourth century, Thurii was a member of the Italiote League and defended itself against Dionysius I of Syracuse, the Lucanians, and the Brettii. In 282 the threat of a Lucanian attack caused the city to ally with Rome, which installed a garrison. Taras attacked Thurii and removed the garrison, sparking a war between Taras and Rome.

Sybota, Battle of (433)

A fairly inconclusive naval battle fought off Sybota (an island to the east of Corcyra) between Corcyra (supported by Athens) and Corinth, which added to the tensions leading to the outbreak of the Second Peloponnesian War (431–404). The battle was the second in the quarrel between Corcyra and Corinth precipitated when Epidamnus, a colony of Corcyra's, appealed for help to Corinth, Corcyra's own mother city, and Corinth agreed. The Corcyraeans decisively won the first naval engagement, off Leucimme, but on learning that Corinth was energetically building an even bigger fleet, asked to join the Delian League. The Athenians reluctantly accepted Corcyra into their alliance; although this was legal under the Thirty Years Peace which had ended the First Peloponnesian War (460/59–445)—neutrals were allowed to join any alliance—the Athenians were worried about degrading relations with Corinth. In the event, the Athenians were swayed by the thought that war with the Peloponnesian League was coming anyway and that they could not afford to lose Corcyra, with its sizeable fleet, as an ally. The Athenians sent 10 triremes to assist Corcyra, with instructions not to engage in combat unless Corcyra was directly threatened.

Corinth mustered 150 ships (90 from Corinth, 10 each from Elis and Leucas, 12 from Megara, 27 from Ambracia, and 1 from Anactorium). Facing them were 110 Corcyraean ships and 10 Athenian ships. The battle began at dawn, with the Athenians initially taking no part in the action. Thucydides (1.49.1) calls the battle "rather old-fashioned" in that the restricted room to maneuver meant that the serious fighting was done by the marines rather than through naval maneuver and ramming. The Corcyraean left wing routed their opposition, pursued them to their camp and began to loot it. The remaining Corcyraean ships, significantly outnumbered, buckled under the pressure and fell back. At this point, the

Athenian triremes began direct engagement of the Corinthians.

The victorious Corinthians recovered their damaged ships and killed any men in the water (mistakenly including some of their own), regrouped and sailed toward Corcyra. Further fighting was avoided when another 20 Athenian ships arrived and the Corinthians withdrew. The next day, the fleets lined up against each other but the Corinthian fleet sailed home when the Athenians assured them that they did not consider themselves at war with Corinth.

Both sides claimed victory and set up trophies. Although the Corinthians had a stronger claim—they had sunk 70 Corcyraean ships and taken 1,000 prisoners—the Corcyraeans thought differently. They had sunk 30 enemy ships, plundered their camp and recovered their own dead without requesting a truce and the Corinthians had refused to engage again on the following day.

Syracuse

Founded by colonists from Corinth led by Archias ca. 734, the first settlement was on Ortygia Island but soon expanded onto the Sicilian mainland at Acharadina. A causeway linked the two and provided Syracuse with two natural harbors: the Lesser Harbor and the Great Harbor (see map). After subjecting the local population, Syracuse began to establish colonies of its own including Camarina. Syracuse rose to become the largest and most important city in Sicily. The city was captured and sacked by the Romans in 212/11.

In 485, Gelon of Gela seized control of Syracuse, easily overthrowing the fledgling democracy that had been established in the city following the expulsion of the oligarchic faction. Gelon settled in Syracuse and transferred the populations of Camarina and Megara Hyblaea to the city. During the First Carthaginian War (480), Gelon and the Syracusans defeated the Carthaginians at the battle of Himera. When Gelon died in 478 he was succeeded by his brother Hieron who ruled Syracuse as Hieron I; during his rule, the Syracusans defeated the Etruscans at the battle of Cumae (474) which halted any further Etruscan expansion southward toward Magna Graecia. After the death of Hieron I, a democracy was established in Syracuse in 466, the chief institutions consisting of an assembly, a *Boule* (or Council), and a board of elected generals (*strategoï*).

During the Second Peloponnesian War Syracuse twice came into conflict with Athens: first during 427–424, and again between 415–413 when the city was besieged by the Athenians. During the siege the Spartans sent Gylippus to the aid of their Syracusan allies. The Syracusans defeated an Athenian fleet in naval engagements in the Great Harbor at Syracuse and the Athenian land forces attempted to retreat into the Sicilian hinterland. The siege of Syracuse ended in a catastrophic defeat for the Athenians.

In 406/5, Dionysius I seized power in Syracuse and during his rule (406/5–367), Syracuse fought three wars against the Carthaginians. His rule also saw the fortification of Ortygia Island, the city walls extended to encompass the Epipolae Plateau and the construction of the Euryalus Fortress at its western edge. Engineers employed by Dionysius I in Syracuse also invented the catapult (*katapeltes*). During his rule, Dionysius I transplanted the inhabitants of Leontini, settling them in Syracuse. Under Dionysius I, Syracuse also extended its influence over and dominance of southern Italy (Magna Graecia) and also sought to extend influence into the Adriatic.

Following the death of Dionysius I in 367, his son Dionysius II ruled Syracuse from 367–357. Dion of Syracuse, the uncle of Dionysius II, drove his nephew from power and ruled Syracuse until murdered in 354. Dionysius II regained power in 347, ruling Syracuse until he was forced to surrender to Timoleon in 344. Timoleon introduced political reform in Syracuse to prevent further attempts at tyranny within the city and also encouraged Greeks from mainland Greece to settle in Syracuse.

However, in 317 Agathocles seized power in Syracuse. He drew support

from the masses for his denouncement of the oligarchic faction within the city—and from his army of mercenaries. Agathocles declared himself king ca. 305–304 and ruled until 289. His expansionist military campaigns to bring the Greek cities of Sicily under his power resulted in war with Carthage (311–306) during which Syracuse was unsuccessfully besieged by the Carthaginians. Agathocles died, allegedly from poisoning, in 289. The Greeks of Sicily, hard-pressed by both Carthage and Campanian former mercenaries of Agathocles who had seized Messina, invited Pyrrhus of Epirus to help them. However the severity and heavy-handedness of Pyrrhus' command alienated the Sicilian Greeks and the Syracusans in particular. Faced with disaffection and insurrections among the Sicilian Greeks, Pyrrhus left Sicily to go to the aid of the Tarantines in 276.

Hieron, a Syracusan who had served under Pyrrhus in Sicily, was elected as their commander by the Syracusan army and seized power in a military coup. He became king (as Hieron II) in 270 and ruled until 215. His rule marked an age of prosperity and building. At first an opponent of Rome, in 263 Hieron II of Syracuse became its ally. He employed Archimedes in helping to strengthen the city's defenses with war machines. Hieron II's successor, Hieronymus, sided with Carthage in Second Punic War, and between 213 and 211 Syracuse was besieged by Rome. The city was sacked, Archimedes being among the casualties.

Syracuse, Campaign in Epirus under Dionysius I (385)

In 385, Dionysius I of Syracuse allegedly sought to establish cities in the Adriatic region in the hope of establishing control of the Ionian Sea. With the help of the Molossian exile Alcetas, who was residing at Syracuse, Dionysius allied with the Illyrians, aiming to take control of Epirus and, allegedly, use it as a base from which to plunder the Temple of Apollo at Delphi. Dionysius sent a consignment of 500 panoplies of armor and 2,000 troops to the Illyrians to help them restore Alcetas' rule in Epirus. The Illyrian army, including Dionysius' troops, defeated the Molossians in battle, allegedly slaughtering over 15,000, and restored Alcetas to power. Although the Spartans intervened and expelled the Illyrians, Alcetas remained in power in Epirus. Our main source for this campaign is Diodorus Siculus, who draws on Timaeus. Polybius in particular was highly critical of Timaeus and his work, particularly over Timaeus' lack of military experience.

Syracuse, Campaigns in Italy under Dionysius I (391–367)

In 391, Dionysius I of Syracuse's first attempted invasion of Italy was a

disaster. Crossing from Messana to Locri with his troops, he advanced on Rhegium. His fleet, however, was intercepted by 60 triremes from Croton, which were joined by a further 60 triremes from Rhegium. During the battle a storm sprang up and Dionysius barely made it back to Sicily.

In the aftermath of his unsuccessful invasion of southern Italy, he formed an alliance with the Lucanians, with the aid of whom he undertook a second invasion of Italy in 389. Dionysius is said to have been able to muster more than 20,000 infantry, some 3,000 cavalry, 40 warships, and 300 vessels transporting food supplies.

Dionysius began the campaign by besieging Caulonia when he heard that an enemy force of 2,000 cavalry and about 25,000 infantry of the Italian Greek League had set out from Croton toward him and had encamped beside the Elleporus River. Dionysius immediately abandoned his siege and set out to confront the enemy force. Dionysius deployed his army for battle and caught his enemy strung out on the march, slaughtering the vanguard of the enemy. The units following turned up somewhat piecemeal, fled and took refuge on a hill which had no source of water and which Dionysius immediately surrounded. The beleaguered Italian Greeks, allegedly numbering 10,000, surrendered the next day and to their relief and surprise Dionysius let them return home without demanding a ransom for their release. This act of seeming generosity resulted in most of the Italian Greek cities concluding individual peace treaties with Dionysius, even honoring him with the award of golden crowns. Dionysius still remained at war with Rhegium, Caulonia, and Hipponium, but these were now isolated with the breakup of the Italian Greek League.

In 389, Dionysius captured Caulonia, and in the following year Hipponium also fell to him; he razed both cities to the ground and their inhabitants were resettled in Syracuse. In 387, Rhegium fell too, and Dionysius sold the population into slavery. Dionysius' brutality toward other Greeks made him unpopular within the Greek world, but his victory over Rhegium nevertheless made Dionysius I of Syracuse the chief power in Magna Graecia.

In 384, claiming he was aiming to suppress Etruscan pirates, Dionysius sent a force of 60 triremes and launched a raid against the Etruscan port of Pyrgi, plundered the temple there and amassed about 1,000 talents in booty. The loot was to be used to finance a fresh war against the Carthaginians. In 379 Dionysius, returning to Italy, captured Croton and held it until his death

Syracuse, Siege of (414–413)

This siege (see map) was the central activity in the Athenian Sicilian expedition of 415–413 and involved Athens besieging a city almost as big as itself. In 415 the Athenians tricked the Syracusans into marching to Catana, landed unopposed, and occupied the area near the Olympeum (a temple). The Athenians defeated the Syracusan army on its return but then returned to winter in Catana and Naxos. Over winter (415–414) the Syracusans made improvements to their command structure and training, built forts (including at the Olympeum), and built an additional wall to the west of the main city wall to make any attempt to build a siege wall across the Epipolae (a dominating hill to the west of Syracuse) more difficult.

In summer 414 the Athenians returned, occupied Epipolae before the Syracusans could get there and built two forts—one at Labdulum to store equipment and another one near Syce called the Cyclus (“circle”). They planned to starve the city into submission by blockading Syracuse’s harbor with the fleet while building a wall around the city to prevent supplies and reinforcements arriving by land or the inhabitants escaping. The Cyclus was their main base for achieving this. The Syracusan response was to build counter walls from the city across the path of the Athenian construction to maintain external access.

The siege essentially became a wall-building race, with land engagements at various points to ensure local domination to allow the building to occur. The first two Syracusan attempts failed when the

Athenians defeated them and seized their counter walls and the Athenians were able to complete a double wall from the Cyclus to the sea in the south. A force of about 3,000 reinforcements, led by the Spartan Gylippus managed to traverse Epipolae before the Athenians could complete the wall to the north of the Cyclus and got into the city. The Athenians fortified the promontory of Plemmyrium on the south end of the Great Harbor and continued with the wall building north of the Cyclus.

With the arrival of Gylippus, the Syracusans renewed their efforts and eventually won the wall-building race with a victory on Epipolae that allowed them to complete their third cross wall. This cut the Athenian siege line and prevented them from completing the final section of the wall to the northwest of the city. When the Athenian fleet was defeated in the Great Harbor, the Athenians were forced to abandon the siege and almost their entire force was killed or captured during the subsequent withdrawal. The siege is a good illustration of the difficulties of taking a large city before the invention of the catapult, and the alternative techniques available to the attackers and defenders.

Syria

In geographical terms, Syria is a region of the Near East bounded on the west by the eastern Mediterranean shore, on the north by the Taurus Mountain range, and on the east and south by the Syrian and Arabian deserts. It includes several major rivers (Orontes, Jordan), mountain ranges

(Lebanon, Antilebanon, Amanus, Bargylos, Judaeen Hills), and valleys (Bekaa, Jordan, Great Rift). As a political entity, Syria has changed shape and size across more than 5,500 years of human civilization and history from the Bronze Age to the present.

The Syrian lands came under the control of a succession of world empires: the Akkadians, Assyrians, Babylonians, Hittites, Egyptians, Neo-Assyrians, and Neo-Babylonians all exerted control over the region until the Achaemenid Persians conquered it under Cyrus I the Great in 539. Alexander the Great conquered the region in the late 330s as part of his victory over Darius III, the last Achaemenid Persian ruler.

After the death of Alexander, one of his generals, Laomedon of Mytilene, was put in charge of Syria. The region briefly passed into the control of Eumenes of Cardia, Alexander's former secretary. Upon the defeat of Eumenes by Antigonus I Monophthalmus in 316, Syria became part of Antigonus' empire. After the battle of Ipsus in 301, Syria came under the control of Seleucus I Nicator, the satrap of Babylon, and remained under the control of the Seleucid dynasty for the next two centuries. The only exception was the region of Coele-Syria, part of which was always controlled by the Seleucids, but which was disputed by the Ptolemies of Egypt.

Tigranes II the Great of Armenia controlled Syria from 83, but was defeated by Pompey the Great in 66, after which Syria became part of the Roman Empire as the province of Syria. After the Jewish Bar-Kochba revolt ended in 135 CE, the province was expanded to incorporate Judea, and was reconstituted as the province of Syria-Palestina.

Syrian-Egyptian War, First (274–271)

Causes

The First Syrian-Egyptian War was fought between King Antiochus I of Syria and Ptolemy II Philadelphus of Egypt. The root cause of the Syrian-Egyptian Wars was the competing Seleucid and Ptolemaic claims to the lands of Coele-Syria (roughly the area of modern Lebanon, Israel and Palestine). The Seleucid claim was based on the fact that Syria was granted to Seleucus I Nicator in the settlement following the defeat of Antigonus I Monophthalmus after the battle of Ipsus in 301. The Ptolemaic claim was based on the conquests of Ptolemy I Soter in the region in 302/1. Initially in 301, in recognition of his friendship with Ptolemy, Seleucus ceded his claim to Coele-Syria south of the Eleutherus River (the modern Nahr al-Kabir, on the northern border of Lebanon), but later asserted his rights to the land and declared Ptolemy had wrongly taken it from him (Diodorus 21.1.5), thus setting the stage for the Syrian-Egyptian Wars.

The immediate cause of the First Syrian-Egyptian War was the coordinated attack on Ptolemaic possessions by Antiochus II and his son-in-law Magas, who had been in charge of Ptolemaic Cyrenaica since 301, but rebelled against Ptolemy II in 279.

Course

Magas was forced to call off his invasion of Egypt (most likely in 275) even before Antiochus could begin his attack on Coele-Syria. Egyptian forces invaded Syria in 274, perhaps by sea. These were apparently driven out by Seleucid troops, which then moved well south of the Eleutherus River line, perhaps to the borders of Egypt itself, since an inscription locates Ptolemy and his sister-wife Arsinoe at the eastern edge of the Nile delta supervising the construction of defensive works. Ptolemy eventually recovered his position in Coele-Syria and peace was made on the basis of the *status quo*

before the war in 271.

Consequences

The war ended in stalemate with Antiochus preoccupied with Galatian attacks in Asia Minor. Magas remained in possession of Cyrenaica.

Syrian-Egyptian War, Second (260/59–ca. 253)

Causes

The Second Syrian-Egyptian War was fought between Antiochus II of Syria and Ptolemy II Philadelphus of Egypt. Around 262 or 261, Ptolemy installed his eldest son, Ptolemy Epigonus, as ruler of Ephesus, thus directly challenging Seleucid control of Asia Minor. Epigonus rebelled against his father in 260 or 259 while his friend Timarchus, ruler of Miletus on behalf of the Ptolemies, set himself up as tyrant of that city. After Epigonus was killed by his soldiers, Ptolemy took direct control of Ephesus. Meanwhile Antiochus II attacked Timarchus in Miletus, which Ptolemy chose to regard as an infringement on his sphere, thus sparking the Second Syrian-Egyptian War.

Course

Ptolemy successfully invaded Syria and Cilicia, but was quickly driven out in unknown circumstances. Meanwhile, Antiochus secured an alliance with Rhodes and wrested Ephesus from Ptolemy's control. Peace was made around 253 and sealed with a marriage alliance: Antiochus married Ptolemy's daughter Berenice.

Consequences

The Ptolemies temporarily lost their possessions in Asia Minor and influence in the Aegean. The costs of the war compelled Ptolemy to intensify his taxation regime in Egypt. While Antiochus was preoccupied with the war, Parthia seceded from the Seleucid Empire. Antiochus also had to acquiesce to the permanent settlement of the Galatians in Asia Minor, and the formation of a separate kingdom of Cappadocia there.

Syrian-Egyptian War, Third (246–241)

Causes

The Third Syrian-Egyptian War (also known as the Laodicean War) was fought between Seleucus II Callinicus of Syria and Ptolemy III Euergetes of Egypt. When Antiochus II died, allegedly by poisoning at the hands of his divorced wife Laodice, a succession dispute broke out between Laodice, who claimed the succession for her son, Seleucus II, and Berenice, daughter of Ptolemy II Philadelphus, who supported her son Antiochus' claim to the throne. Berenice called upon her brother Ptolemy III to support Antiochus' claim. Meanwhile, Laodice and Seleucus secured the murder of Berenice and her son.

Course

Ptolemy marched north and was welcomed at Seleucia-by-Pieria and then at Antioch, where he discovered that his sister and nephew had been killed. Ptolemy then occupied Cilicia and Syria and marched perhaps as far east as the Euphrates, perhaps reaching Babylon (reports that he reached Bactria are probably exaggerated). Ptolemy regained Ephesus as well. Seleucus mustered a fleet against Ptolemy, but it was destroyed in storms. Ptolemy was recalled to Egypt by an outbreak of unrest there.

The course of the war after this is unclear. Aradus in Coele-Syria fell under Ptolemy's control for a few years, but reverted to near-independence in the Seleucid sphere soon afterward. Ephesus, Miletus, Samos, and parts of Hellespontine Thrace, including Aenus and Maronea, all became Ptolemaic possessions before the war was over. Seleucus retook Damascus before peace was made.

Consequences

By the time peace was made in 241, the Ptolemaic Empire reached its greatest extent at Seleucid expense. Ptolemaic control over Seleucia-by-Pieria was a particularly important prize, though its possession by Egypt virtually guaranteed further conflict between the two kingdoms.

Syrian-Egyptian War, Fourth (221–217)

Causes

The Fourth Syrian-Egyptian War was fought between Antiochus III the Great of Syria and Ptolemy IV Philopator of Egypt. Antiochus was a young man of enormous ambition and energy when he came to the Seleucid throne in 223. He immediately set about trying to restore his empire to its greatest extent. During the succession crisis in Egypt, when Ptolemy IV succeeded his father Ptolemy III amid civil disturbances and court intrigue, including the murder of Philopator's mother Berenice II and his brother Magas, Antiochus began planning the conquest of Coele-Syria. Antiochus' opportunism may have been compounded by his desire for revenge against the Ptolemaic regime for the assistance it provided Attalus I of Pergamum against Seleucid interests in Asia Minor.

Course

Antiochus marched into Coele-Syria in 221 with the aim of retaking Seleucia-by-Pieria, a Ptolemaic possession since the Third Syrian-Egyptian War. Antiochus was forced to call off the invasion, however, after Molon, his renegade commander of the upper satrapies, defeated the king's generals sent against him. After defeating Molon, Antiochus resumed the war against Ptolemy, ignoring the incipient rebellion of his commander in Asia Minor, Achaëus, whose revolt may have been instigated by Ptolemy.

Upon his return to Coele-Syria in 219, Antiochus took Seleucia-by-Pieria. Then Theodotus, Ptolemy's commander in the region, defected to Antiochus, turning over to him Ptolemais and Tyre. Antiochus began advancing southward, laying siege to Ptolemy's cities, while Ptolemy's ministers, Sosibius and Agathocles, managed to secure a four-month truce with the Seleucid king during winter 219/18. This gave Ptolemy the time he needed to assemble and train a massive land army, including 20,000 Egyptian soldiers.

In spring 218, Antiochus resumed operations, taking Ptolemaic cities by surprise and by siege, and also overwhelming Ptolemy's generals in battles on land and sea. In summer 217, the Seleucid and Ptolemaic armies clashed at Raphia in southern Palestine. Antiochus was defeated and sued for peace.

Consequences

Antiochus was forced to withdraw from Coele-Syria entirely, while Ptolemy failed to follow up his victory by attacking Seleucid territory, instead choosing to return to Egypt.

Syrian-Egyptian War, Fifth (202–195)

Causes

The Fifth Syrian-Egyptian War was fought between Antiochus III the Great of Syria and Ptolemy V Epiphanes of Egypt. Like the Fourth Syrian-Egyptian War, the Fifth originated in Antiochus' taking advantage of a succession crisis in Egypt to attack Coele-Syria. Shortly after the accession of the five-year-old Ptolemy V to the Egyptian throne in 204, Antiochus struck a secret pact with Philip V of Macedon to attack Ptolemaic lands and divide the kingdom between themselves.

Course

Antiochus attacked Coele-Syria in spring 202, and seized Damascus in Palestine. He then began a long siege of Gaza, but it too fell before the end of summer 201. Ptolemy's governor in the region, Ptolemaeus son of Thrasea, defected to Antiochus in late 202 or 201. Ptolemy's ministers charged Scopas the Aetolian with the defense of Coele-Syria. He began his invasion in a surprise winter campaign (201/200) and retook Palestine. In the latter half of 200, Scopas' forces clashed with Antiochus' at the battle of Panium. Antiochus was victorious, and he began reestablishing Seleucid authority in Palestine. He then turned to the Phoenician coastal cities, and blockaded Scopas in Sidon until summer 199, when the city surrendered. He also captured Berytus and Byblus, and successfully besieged Ptolemaïs, Tyre, and perhaps Joppa. By early 198, Coele-Syria was under Seleucid control.

In 197, Antiochus attacked Ptolemaic possessions in Asia Minor. His fleet took all the Ptolemaic ports on the south and Aegean coasts, and his land army removed all remaining Ptolemaic forces from inland Cilicia and Lycia. Peace was made by 195, and Antiochus' daughter Cleopatra was betrothed to Ptolemy. They married in winter 194/3.

Consequences

The Fifth Syrian-Egyptian War undid the results of the Third and Fourth Wars, eliminating all outposts of Ptolemaic power from Asia Minor and Coele-Syria for good. The Seleucid dream of reestablishing its ancestral claims to Coele-Syria had finally been achieved.

Syrian-Egyptian War, Sixth (170-168)

Causes

The Sixth Syrian-Egyptian War was fought between Antiochus IV Epiphanes of Syria and Ptolemy VI Philometor of Egypt. Antiochus III's daughter Cleopatra, wife of Ptolemy V and mother of Ptolemy VI Philometor, died in 176, after ruling jointly with her young son since the death of her husband in 180. An anti-Seleucid backlash in Egypt followed, and in 170, Philometor's regents Eulaeus and Lenaeus declared war on Antiochus IV.

Course

By 169, Antiochus defeated an Egyptian army at Pelusium on the eastern edge of the Nile Delta. Eulaeus and Lenaeus were overthrown by an anxious Egyptian populace and replaced with Comanus and Cineas, who negotiated with Antiochus. Antiochus took his nephew Ptolemy VI under his guardianship, making him effectively the ruler of Egypt. Unhappy with this, the Alexandrians appointed Philometor's younger brother, Ptolemy VIII Physcon, king. Antiochus laid siege to Alexandria in 169 but failed to take it and withdrew.

Over the course of the winter, Philometor and Physcon were reconciled, provoking Antiochus into attacking Egypt again. The Ptolemies requested protection from Rome, but the latter was too preoccupied with the Third Macedonian War against Perseus to offer any help. Antiochus took Memphis and Cyprus, and marched on Alexandria. However, at Eleusis, on the city's outskirts, he was met by a Roman delegation led by a former consul, Gaius Popilius Laenas, the Romans having just defeated Perseus at the battle of Pydna. Antiochus held out his hand to Laenas, but the latter refused to shake it, instead handing him a copy of the senatorial decree

ordering him to stand down. Antiochus said he would have to consult his advisers before giving his response, but Laenas drew a circle around the king in the sand with a stick, ordering him to respond before he stepped out of the circle. Antiochus acquiesced, and Laenas took his hand and greeted him as a friend and ally of Rome.

Consequences

The Seleucids withdrew from Egypt and never attacked it again. More significant, however, is the fact that all states in the Hellenistic East had to be mindful of and answer to the power of Rome.

Syrian-Roman War (192–188)

Causes

The Syrian-Roman War pitted Antiochus III the Great and the Aetolian League against Rome. The war was caused by mutual mistrust, Roman fear of Antiochus' power and ambitions and, according to Polybius, the anger of the Aetolians, who invited the king to liberate Greece, that is, to replace Rome as the arbiter of Greek freedom. Aetolian anger stemmed from perceived slights against the Aetolian League by the Romans, especially Rome's failure to reward them sufficiently for their loyalty and service to Rome during the Second Macedonian War.

Lengthy diplomatic preliminaries, stretching across almost five years, preceded the actual outbreak of war. In 196, Titus Quinctius Flamininus, the Roman liberator of Greece, warned Antiochus not to infringe upon the

autonomy of the Greek states of Asia Minor, and to relinquish control of the former possessions of Philip and Ptolemy in Asia Minor. At the conference at Lysimacheia in September 196, the Roman commissioners in charge of the settlement of the Second Macedonian War demanded that Antiochus leave the Greek cities of Asia alone, evacuate Thrace, and reconcile with Ptolemy. Antiochus defended his activities in Thrace and Asia Minor as a reassertion of traditional Seleucid prerogatives, questioned Rome's right to interfere in his sovereign affairs, and announced a marriage alliance with Ptolemy. In late 194, Antiochus sent envoys to Rome to request a formal treaty of alliance to clarify his status, power, and sphere of interest vis-à-vis Rome's. This the Romans refused, and demanded that Antiochus withdraw from Thrace (while conceding, if he complied, that the king could do as he wished with the Greek states of Asia Minor). The next year, during a conference that was interrupted by the death of Antiochus' son Antiochus, the Romans reiterated their demands concerning Thrace and the Greek cities, while the king's minister Minnio, speaking on the absent king's behalf, reasserted Seleucid ancestral rights. Talks broke down when it was clear that neither side was prepared to budge.

Course

In 192, the Aetolian League made Antiochus its *strategos* for 192/1, and invited the king to cross the Aegean to Greece. Antiochus embarked with 10,000 men—too few to anticipate a war with Rome, which, even at this late date, was by no means a foregone conclusion. War only became inevitable when Antiochus' men attacked a detachment of Roman troops at Delium. The Roman consul Manius Acilius Glabrio crossed to Greece in 191 with a substantial force. Antiochus took his relatively small army to Thermopylae to make his stand against the Romans, as much for strategic reasons (small numbers would be most effective in the narrow space) as for the historical symbolism of the place: like the Spartans in 480, the king could pose as the champion of Greek freedom against the barbarian aggressors, the Romans, who would be cast in the role of the invading Persians. The Romans, however, used the same path around the pass by which the Spartans had been betrayed in 480, and easily defeated the Seleucid forces. Antiochus fled back to Asia.

The Romans, under the command of the consul Lucius Cornelius Scipio launched an amphibious campaign in Asia Minor in 190. The combined

Roman-Rhodian fleet defeated the Seleucid navy (a portion of which was under the command of Hannibal, now exiled from Carthage) in two battles at Side/Eurymedon and Myonessus. The consul Scipio (alongside his brother and adviser Publius Cornelius Scipio Africanus, Hannibal's conqueror in the Second Punic War), was escorted to the Hellespont through Macedon and Thrace by Philip V, and launched a land invasion of Asia Minor. Antiochus' attempts to negotiate a solution failed when Scipio demanded that he evacuate Asia west of the Taurus and pay all war-related expenses. The Romans and a coalition of their allies, including Eumenes II of Pergamum, defeated Antiochus' forces at Magnesia-by-Sipylum (Magnesia ad Sipylum) in Lydia in 190.

Consequences

Antiochus sued for peace, which was granted on the following terms in the Peace of Apamea (formalized in 188): the king was to withdraw from all lands west of the Taurus Mountains and Halys River; pay 15,000 talents, 500 immediately, 2,500 upon ratification of the peace, and 1,000 each year over 12 years; hand over Hannibal and other advisors, as well as 20 hostages; and give up all war-elephants and retain no more than 12 warships. Antiochus' territory in Asia Minor was partitioned between Pergamum and Rhodes.

Meanwhile, in Greece, the Romans and Philip V of Macedon fought Antiochus' allies, the Aetolians. After the battle of Thermopylae, the Romans laid siege to the Aetolians at Heraclea while Philip besieged Lamia. Macedonian forces also took control of Athamania, an Aetolian League ally. Heraclea soon fell, and Glabrio ordered Philip to call off the siege of Lamia. In summer 191, the Aetolians sought a truce and talks with the Romans, but negotiations failed when a dispute arose over the nature and terms of surrender. After the truce expired, the war began again. As the war with Antiochus, and Roman attention, shifted eastward, the Aetolians and their allies the Athamanians recovered most of their losses from Philip. After the battle of Magnesia, however, the Romans returned to Greece. The Aetolians, lacking all hope of carrying the war on without Antiochus, sued for peace, which was granted in 189 on condition that they pay a 500-talent indemnity, give up any gains from the recent war, and not expand the League in future. They also signed a treaty of alliance promising to "respect the majesty of the Roman people" in future.

Tactics. See Naval Tactics; Strategy

Taenarum

Taenarum, at the tip of the Mani peninsula (modern Cape Matapan) in the south of Laconia was the site of an important Spartan temple of Poseidon. In the time of Alexander the Great it became a recruiting center for mercenaries, beginning in 332, with Agis III's attempt to remove Macedonian domination of Greece.

In 324, when Alexander's treasurer Harpalus fled to Greece, he left 6,000 mercenaries at Taenarum. Apparently large numbers of mercenaries disbanded by Alexander's governors or who had served with Persia, with nothing to hope for from Alexander, had already gathered there. Harpalus took 7,000 mercenaries with him to Crete. Thibron, who took over Harpalus' army, recruited another 2,500 in Taenarum. The Athenian general Leosthenes provided shipping for mercenaries from Asia Minor to Taenarum.

In the Lamian War (323–322), Leosthenes was said to have recruited 50,000 mercenaries (Pausanias 1.25, 8.52). The figure is inflated but shows how important Taenarum was as a recruiting depot. In 315 Antigonos I Monophthalmus recruited 8,000 mercenaries from the Peloponnese after getting "permission" (Diodorus 19.60) from Sparta, indicating that Taenarum continued as a recruiting depot. The rogue royal Spartan Cleonymus recruited 5,000 mercenaries there in 303. Afterward, it drops out of history.

Tamynae, Battle of (348)

A battle fought in Euboea between Athens (in support of Plutarch—tyrant of Eretria, not the author/biographer) and Euboean rebels, supported by Philip II of Macedon. The Athenians were victorious.

Athens’ involvement in Euboea was to counter Philip II’s spreading influence. The 3,000-strong Athenian force, comprising hoplites (including the *epilektoi*, or elite troops) and cavalry, and commanded by Phocion and Molottus, served alongside Plutarch and his predominantly mercenary troops. The rebel force was of unknown size and commanded by Callias of Chalcis. Phocion refused to march out, citing unfavorable sacrifices, but may have been waiting for reinforcements. Plutarch saw this as cowardice and launched an impetuous attack with his mercenaries; contrary to orders the Athenian cavalry joined them. The rebels held this disorganized attack and pushed Plutarch’s mercenaries and the cavalry back. However, by the time they had reached the Athenian camp the rebels had fallen into disorder. Phocion announced that the sacrifices were now auspicious and attacked, with his *epilektoi* leading; the enemy were routed when the Athenian cavalry re-formed and attacked. Aeschines, the famous Athenian orator, served in the *epilektoi* and received an award for bravery. After the battle the Athenians expelled Plutarch from Eretria, presumably to strengthen Athenian influence there.

The battle demonstrates Phocion’s tactical judgment and the use of prebattle sacrifice. It restored Athenian control of Euboea—although they granted it independence soon afterward.

Tanagra, Battle of (457)

A Peloponnesian League victory over the Athenians early in the First Peloponnesian War (460/59–445). In the summer of 457, the Peloponnesian League force was returning home from the north and estimating the threat from the Athenian fleet in the Corinthian Gulf as more dangerous than an Athenian land attack, chose the overland route home. The expedition (11,500 strong, including 1,500 Spartans) had forced Phocis to return territory to Doris and, more significantly, reconstituted the Boeotian League. The latter was a major threat to Athens' position and the Athenians, assisted by Argos, attacked the Peloponnesians near Tanagra in Boeotia.

None of the sources provide much detail of the fighting although Diodorus Siculus does describe an immediately subsequent action where the Athenians had the better of the encounter. The main battle seems to have been hard fought, with the Athenians and Argives narrowly losing when their allied Thessalian cavalry deserted to the enemy during the engagement.

The victory had the potential to be a major setback for Athens, giving the newly reformed Boeotian League breathing space to reestablish itself. However, the Athenian victory at Oenophyta soon afterward negated the loss at Tanagra, allowing them to reestablish control over Boeotia.

Taras/Tarentum

A Spartan colony on the Gulf of Taranto in southern Italy founded in ca. 706 by Phalantus. It was originally named Taras after a mythological hero of that name who was fathered on a local nymph by Poseidon. Despite the hostility of neighboring Italian tribes, the city thrived and soon became the dominant city of Magna Graecia. Taras established colonies of its own including Heraclea (also on the Gulf of Taranto) in 433. The geographical location of Taras made the city the natural stopping point for ships sailing west from mainland Greece. The city's fortunes began to decline from the middle of the fourth century and eventually the city fell to the Romans in 272. During the Second Punic War, Taras, now renamed Tarentum, revolted from Rome and sided with the Carthaginian general Hannibal in 213, but in 209 Tarentum fell again to the Romans, who sacked the city.

Originally a monarchy, a heavy defeat in the first quarter of the fifth century during the Iapygian-Tarentine Wars allegedly wiped out so many of the aristocracy that a democracy was established in the city. During the Second Peloponnesian War (431–404), Taras took the Spartan and Syracusan side against Athens.

Taras reached the height of its economic prosperity and military power in the first half of the fourth century, in part because of the influence and leadership of the scientist, philosopher, and Pythagorean mathematician Archytas, who also served as a general for the city. But after the death of Archytas, in the mid-fourth century, and faced with the hostility and growing power of Italian tribes, the city called upon a succession of generals from elsewhere, including King Archidamus III of Sparta, King Alexander I of Epirus, and Cleonymus of Sparta. In 281 the Tarantines invited Pyrrhus of Epirus to help them, but he was unable to save the city from the growing power of Rome, which took it in 272.

“Tearless Battle” (368)

A Spartan victory over a combined Arcadian-Argive force in Arcadia in 368. It was the first significant Spartan victory since their decisive defeat at Leuctra (371). The battle was fought in the context of the collapse of Spartan domination in the Peloponnese and the beginnings of Arcadian assertions of independence from Thebes. The Spartan campaign responded to growing Arcadian ambition and perhaps specifically the foundation of Megalopolis. Although Diodorus Siculus dates this after this battle, the weight of the evidence suggests it preceded it.

The Spartans, under Archidamus III, supported by Celts, Iberians, and cavalry from Dionysius I of Syracuse, captured Caryae and ravaged Parrhasia. After a move to assist his Syracusan allies who were blocked from returning home, Archidamus met with an Arcadian/Argive force marching to cut him off. Spartan morale was high and, when they charged, the bulk of the enemy broke and ran before contact. The Syracusan light troops and cavalry proved especially deadly in the ensuing pursuit. A very large number of Arcadians and Argives were killed (Diodorus specifies 10,000) while not a single Spartan died—giving rise to the name “Tearless Battle.” The victory was a particularly opportune one for Sparta, which was still recovering from Leuctra and suffering a manpower shortage.

Tegea

Tegea was a *polis* located in the southern part of the central Arcadian high plain. In size and importance in Arcadia only its neighbor, Mantinea, matched it.

In early times, Tegea resisted domination by its southern neighbor, Sparta. It won a memorable victory of uncertain date (ca. 570, but probably somewhere between 575 and 560?) in what is referred to the “Battle of the Fetters” (Herodotus 1.66). However, by ca. 550 Tegea was a Spartan ally. At the battle of Plataea (479), Tegea unsuccessfully claimed the post of honor on the Greek left wing on the basis of their military prowess in legendary and recent times (Herodotus 9.26–8). Tegea took part in the Arcadian wars against Sparta in the 470–460s but in the Second Peloponnesian War (431–404) was a firm Spartan ally.

It remained so until 370, when the faction in Tegea supporting the new Arcadian federal state staged an armed uprising after it lost the political argument. Opponents were massacred and some 800 driven into exile at Sparta. When the Arcadian League split ca. 363, Tegea remained on the side hostile to Sparta that fought in the battle of Mantinea (362).

Tegea stayed out of later Greek conflicts with Philip II or Alexander the Great. An important inscription found at Tegea, dating from ca. 324 or soon after, records elaborate measures put in place to deal with the return of exiles in accordance with a decree issued by Alexander the Great.

After Alexander the Great’s death (323), Tegea was caught up in the power struggles in the Peloponnese. In 266 it joined the Greek states opposed to Antigonos II Gonatas in the Chremonidean War (267/6–263/2). In 244 it became an ally of Aetolia. It became subject to King Cleomenes III of Sparta (reigned ca. 235–222) and was liberated by Antigonos III Doson in the campaign that led to the battle of Sellasia (222). After this, it joined the

Achaean League. In 147 Tegea was the scene of a last, abortive conference between envoys of Rome and the Achaean League.

Tegyra, Battle of (375)

A Theban victory over a Spartan force in Boeotia in 375. Despite the small number of troops involved it was a significant indicator of the decreasing domination of the Spartan hoplite. Plutarch (*Pelopidas* 16.1) describes it as “a type of precursor to Leuctra”—Sparta’s decisive defeat in 371.

The Theban general Pelopidas had led the Theban Sacred Band (300 hoplites) and a small force of cavalry against Orchomenus, hoping to take it while its Spartan garrison was away in eastern Locris. Learning that the garrison had been replaced, Pelopidas withdrew via Tegyra, on the north shore of Lake Copaïs. En route his army met with the original Spartan garrison (numbering between 1,000–1,800 men) returning to Orchomenus.

Despite being outnumbered, Pelopidas ordered his cavalry to charge, following this with a vigorous charge by the Sacred Band. The Spartan polemarchs were killed in the initial clash and the troops around them gave way, parting so the Thebans could pass through. Instead, Pelopidas turned against the remainder, causing the Spartans to break. There was no real pursuit because of the threat from Orchomenus, so Pelopidas’ men set up a trophy, stripped the dead, and left. The battle was a huge psychological boost to Thebes in its struggle against Sparta and was the first major step in creating Pelopidas’ reputation as an inspired commander.

Teisamenus (ca. 520–450)

Teisamenus came originally from a celebrated family of *manteis* or prophets in Elis. The Delphic oracle had declared he would win the “five greatest contests,” which he first thought meant the pentathlon at the Olympic Games. The story goes that the Spartans realized that the oracle meant success in predicting the outcome of battles and had to accept Teisamenus’ demand of Spartan citizenship (an extremely rare honor for outsiders) for himself and his brother Agias to persuade him to serve them as a *mantis*.

Teisamenus officiated at the battle of Plataea against the Persians in 479 and went on to predict victory for Sparta in four other battles: at Tegea against the Tegeans and Argives (ca. 475?), at Dipaea against Arcadians (ca. 470?), at Isthmus (or “Ithôme”?) against the Messenians (ca. 465?) and at Tanagra against the Athenians and Argives (457).

Ten Thousand, March of the (401–400)

The round number, “Ten Thousand” refers to the Greek mercenaries raised by Cyrus the Younger for his attempt in 401 to overthrow his older brother Artaxerxes II. These consisted at the maximum of 9,600 hoplites, 500 Greek light troops, 500 Greek peltasts, 800 Thracian peltasts, and 200 Cretan

archers, a total of 11,900.

Cyrus, supreme Persian commander in Asia Minor, increased his own force of Greek mercenaries and paid for others raised by trusted friends in the Greek world. In this he had the tacit cooperation of Sparta, whose keen ally he had been in the last phase of the Second Peloponnesian War. In the early summer of 401, he assembled all available Greek mercenaries and his Asiatic forces, numbering around 100,000, at Celaenae in western Asia Minor. He marched eastward, saying that his object was to stop raiding by the hill tribes of Pisidia. As he moved beyond Pisidia toward the Cilician Gates, the only route through the Taurus range into Cilicia, the Greek troops became increasingly uneasy. When they reached Tarsus they mutinied but Cyrus reassured them by promising extra pay and saying that he was campaigning against Abrocomas, the satrap of Syria.

Cyrus had entered Cilicia with the connivance of its ruler Syennesis. At Issus, he was joined by his own fleet and also 35 triremes from Sparta, bringing 700 more hoplites under Cheirisophus. Cyrus had called upon Sparta for this open support. Cyrus intended to use his naval forces to turn the Syrian Gates, the pass leading from Cilicia to Syria, if Abrocomas resisted. However, Abrocomas withdrew and Cyrus marched unopposed to the crossing of the River Euphrates at Thapasacus. It was now plain what Cyrus intended and the Greek mercenaries again mutinied. They were won over by speeches from Cyrus' chief mercenary commander, the Spartan exile Clearchus, and Cyrus himself, accompanied by the promise of even higher pay and lavish rewards.

Cyrus marched southward down the left bank of the Euphrates as Artaxerxes' forces fell back. Finally, in about September, at Cunaxa some 45 miles north of Babylon, Cyrus made contact with Artaxerxes' army. Artaxerxes had followed a defensive strategy but had to defend the important city of Babylon.

Artaxerxes had to use Asiatic infantry against Cyrus' Greek mercenaries. On Cyrus' left wing in the battle, these cleared away the Asiatic infantry opposite them. The rest of the battle went against Cyrus, who lost his life in a desperate attack on the Persian center.

At Cyrus' death his Asiatic troops fled or deserted to the other side. The Greeks returned to their camp unmolested by the Persian cavalry. The next day they refused a demand that they surrender. Cyrus' Persian friends were preoccupied with coming to terms with Artaxerxes and the Greeks were left

to make their own arrangements.

Tissaphernes was entrusted with dealing with the Greeks, whom Artaxerxes regarded as enemies deserving vengeance. The Greeks were forced to rely upon Tissaphernes' promises. They could not return by the same the route they had come by. They were without supplies and, in any case, would have been exposed to attack by Tissaphernes' cavalry. Tissaphernes wanted to lure the Greeks out of the area round Babylon which was crisscrossed by irrigation canals and, by promising safe-conduct and supplies, led them south of Babylon to a crossing of the River Tigris at Sittace. They then marched north to the River Zab. There the Greeks' growing suspicions of Tissaphernes led Clearchus to attempt negotiations. With his chief officers and 20 other senior commanders, he was induced to attend a banquet at Tissaphernes' headquarters. There the Greeks were all treacherously seized and sent to Artaxerxes for execution.

In the crisis that followed, the Greeks decided to elect new officers, including the Spartan Cheirisophus as chief and Xenophon, a young Athenian. The army continued its march north in a hollow square, harassed by Tissaphernes' cavalry and slingers. In response, the Greeks improvised some cavalry and slingers of their own but did not even try forcing a crossing of the River Tigris at Jezirah.

At this point the Greeks' only way out was to strike northward through the mountains of Kurdistan in the hope of reaching the coast of the Black Sea, where there were Greek colonies that might help them get back to Greece. This route prevented any further attacks by Persian cavalry but required that the Greeks fight their way through hostile tribes. At the same time, the army had to keep up the march though increasing winter cold and heavy snowfalls. These mercenary hoplites showed the highest resilience and resourcefulness in flanking attacks and feints to force their way through strongly held positions. March discipline was maintained by example and exhortation of the officers, who did everything to keep the army moving.

Finally, in about February, 400, the vanguard of the army caught sight of the Black Sea. Now reduced to about 8,600 in number, the Greeks still had to find their way home. The Greek cities on their route did not have enough ships to transport them by sea and were themselves justifiably anxious at the sudden arrival of such a large and hungry mercenary army. The army now held more frequent meetings to decide on their movement but dissensions became common and separate groups went off on pillaging

missions of their own, at times disastrously. By a combination of land marches and sea transport they finally reached Byzantium in late autumn. The local Spartan commanders had long been unhelpful or hostile to the army. Many mercenaries deserted as winter came on and some 6,000 under Xenophon resorted to service with the Thracian king Seuthes in a winter campaign against rebellious subjects. Seuthes did not keep his promises of pay and in spring 399 what was left of the army willingly took service under Thibron to fight in Sparta's war against Persia in Asia Minor. Some of these mercenaries, including Xenophon, were still in Spartan service at the battle of Coronea (394).

Xenophon's *Anabasis* is a graphic account of the march and is richly informative on the behavior and the thinking of Greek mercenaries. Xenophon also did not underplay his own part as a leader. The spectacular successes of the "Ten Thousand" confirmed the belief among both Greek and Persian commanders in the superiority of Greek infantry to Asiatic. They also stimulated the idea that Greek military conquests in the Persian Empire were possible.

Territory and War

On the surface Greek warfare, at least in the Archaic and Classical Periods, was rarely fought specifically for territorial gain. Most *poleis* were not interested in territorial aggrandizement so much as acquiring competitive status. At a formal level, hoplite battles were fought for temporary

possession of the actual ground on which the battle was fought, so that the victor would be able to bury their dead without asking the enemy to let them.

There are exceptions. It was generally believed that the Spartans had acquired Messenia by conquest (in the First Messenian War), though we have no way of knowing whether this was true. A much more clear-cut case is Argos, which steadily from the sixth to fourth centuries subjugated and annexed the territory of the small neighboring *poleis*, until Argive territory ended up comprising the whole central plain of the Argolid. In Sicily Syracuse similarly expanded at the expense of nearby cities in the fifth century, while Olynthus in the Chalcidice did the same in the fourth century. In the fifth century, Athens forced states into tribute-paying alliance, but usually did not annex them, though Athenians were settled as cleruchs on allied territory; Aegina was an exception as the Athenians expelled the population in 427 and replaced them with Athenian settlers.

It was the settler societies of the Greek colonies around the Mediterranean who most often fought their neighbors—non-Greeks—to take over their land. Yet we very rarely hear the details of these conflicts, which apparently felt as natural to the Greeks as colonial expansion did to European colonists in recent centuries.

Yet Greek states did often fight wars over borderlands, often of little economic value, but flash points between highly competitive neighboring societies. Herodotus has Aristagoras, trying to induce the Spartans to support the Ionian Revolt, comment that the Greeks fight wars over small pieces of not very valuable land, when they could be plundering Persia. As an example, the conflict that helped spark off the Corinthian War in 395 was over some grazing land near Mount Parnassus, long a point of contention between the nearby Phocians and western Locrians. The *Hellenica Oxyrhynchia* tells us that both groups were in the habit of raiding each other's sheep in this area, but in 395 a retaliatory raid by the Locrians was enough to incite the Phocians into a full invasion of Locris. In Asia Minor, Samos and Priene regularly fought over an area known as "the brambles."

Sparta and Argos had a longstanding conflict over a small coastal plain on the east coast of the Peloponnese, known as Cynuria or Thyreae. It was a long way from the Laconian heartland, and not of great value to the Spartans, who were mainly intent on denying it to the Argives. In 431 Sparta gave it to the Aeginetans who had been displaced by the Athenians.

In 424, the Athenians raided the territory, not to claim it but to capture and execute the hapless Aeginetan settlers. In 421 the Argives made the return of the land a condition for renewing their 30-year peace with Sparta, but later proposed a peace which allowed either side to challenge the other to battle over the disputed territory (and nothing else). Territories like this had a symbolic value far higher than any strategic or economic importance.

Such hotspots were scattered all around Greece: between Mantinea and Tegea, between Megara and Corinth, between Boeotia and Attica, but usually had more to do with status and honor than with territorial expansion.

Thalassocracy

“Thalassocracy” literally means “rule of the sea” and although it has strong connotations of “naval supremacy,” probably best equates to the broader modern term “sea power.” Sea power is a concept evident in Classical Period Greek thought, especially in the writings of Thucydides and the “Old Oligarch.” In mythical times King Minos of Crete was said to have established his empire through rule of the sea, and Agamemnon was only

able to launch the Trojan expedition because of his strong navy and the fear it induced. The first historical figure recognized as using sea power to great effect was Polycrates, the sixth century tyrant of the island of Samos.

Herodotus says that the naval battle of Salamis was the most important battle of the Persian Wars, more influential than the hoplite battles before and after. Both Thucydides and the “Old Oligarch” (pseudo-Xenophon, *Constitution of the Athenians*) make it clear that Athens established and maintained its empire through rule of the sea, and both authors refer to Athens as a metaphorical island, virtually impervious to land attack and able to strike out by sea.

The Old Oligarch neatly summarizes the advantages of being a sea power, including the ability to raid coastal territory at will and the capacity to control seaborne trade and starve out enemies. Thucydides describes the Second Peloponnesian War (431–404) in such a way that sea power comes out as the central factor in its conduct, with great naval battles, trade disruption, and many amphibious campaigns conducted throughout the Mediterranean. As Thucydides describes the war, it is clear that it was only when Athens began losing its control over the sea that the Spartans and their allies were able to gain the upper hand through their own sea power, not through their traditional power on land.

Thasos

Thasos is an island situated in the far north of the Aegean Sea, less than 10 miles (16 kilometers) from the Thracian coast. The island’s geographical location was of great strategic and military importance, straddling sea-

routes connecting the Aegean Sea with the Black Sea, and the coast of Asia Minor with Thrace, and as an island from which the resources of Thrace could be exploited.

Tradition had it that Thasos was settled in 680, by colonists from Paros. By the beginning of the fifth century, Thasos had a powerful navy and considerable wealth, derived in particular from mining on the island and in its possessions on the mainland. Nonetheless, despite its powerful navy and strong fortifications, in 492 the island surrendered without resistance to the Persians. In 477, after the Persians retreated from Greece, Thasos joined the Delian League as a contributor of ships. In 465, however, Thasos revolted, and the Athenians besieged the island for three years. When they surrendered, the Thasians had to pull down their walls, surrender their mainland possessions, and pay tribute. During the Second Peloponnesian War, Athens used Thasos as a naval-base. In 410, Thasos became an ally of Sparta, and there followed a long period of intermittent but bloody *stasis* between pro-Spartans and pro-Athenians.

In 378/7, Thasos joined the Second Athenian Confederacy, and regained some of its lost territory on the Thracian coast; in 360, the island founded Crenides near Mount Pangaeum. In 340/39 Thasos was captured by Philip II of Macedon, but seems to have retained its autonomy until 202 when Philip V of Macedon took it. The Romans restored its independence in 196.

Thebes, Invasions of the Peloponnese

After the Thebans destroyed much of the remaining Spartiate citizen body at the battle of Leuctra (371), worsening the Spartiate population shortage, they were excluded from peace negotiations at Athens. Sparta was clearly weak and many of Sparta's Peloponnesian allies had already sworn mutual aid oaths with Athens. Taking advantage of this weakness, the Thebans invaded the Peloponnese. Technically, they came to stop Sparta from attacking Arcadia, which was in the process of reorganizing itself into a federal state. Several groups invited the Thebans to invade, including the Arcadians, Argives, Eleians, Laconian *Perioikoi*, and Caryeais, the latter two specifically citing Sparta's low population as an attraction for invasion. The Thebans and Arcadians first invaded Laconia in winter 370. Although stopping short of Sparta itself, they ravaged the port-town of Gytheum and several other Laconian towns. Panic resulted in Sparta: some Spartiates planned revolution, and 6,000 Helots were given freedom and weapons to defend Sparta. The Spartans received help from mercenaries and from Corinth, Phlius, Epidaurus, Pellene, and some other states, and fought for several days. By fighting and perhaps bribery they induced the invading armies to go home when winter storms began.

These campaigns permanently maimed Spartan power. The Thebans freed the Messenians from helotry and established or reestablished the heavily fortified city of Messene at Mount Ithôme as a capital for the Messenians; self-styled Messenians from all around the Mediterranean were then invited to settle there. This took a huge amount of Spartan-controlled farmland away from Sparta, halving its economy. Simultaneously, probably with Theban assistance, the Arcadians created the city of Megalopolis as a capital for an Arcadian League, which became a major Peloponnesian power into the Roman period. In the first campaign, Sparta asked Athens for aid, which was sent, and the Theban army withdrew. In the second campaign (369), Epaminondas defeated Sicyon and Pellene, and attacked Epidaurus, Troezen, and Corinth. Syracusan and Athenian military assistance appeared, causing Epaminondas and his army to withdraw again.

Alongside these invasions and closely following them, oligarchic pro-Spartan institutions in many Peloponnesian *poleis* gave way to civil wars, and then to wider franchises such as in Argos, Elis, and Tegea. Ethnic/national consciousness also flourished in some city-states. Many cities in

northern Greece found Thebes a more sensible ally than Sparta, severely weakening Sparta's Peloponnesian League. Thebes secured Persian trust and received the king's support for Messenia's autonomy. The King's Peace was renewed, involving Sparta's Peloponnesian allies but not Sparta. These losses plus the preexisting Spartiate population decline transformed Sparta from an international to a local player, and crippled the Spartiate aristocratic warrior lifestyle by removing much of the basis of the luxury that had given Spartiates their peculiar privileges and attitudes.

Thebes, Thebans

The city of Thebes was an important Greek center in the Bronze Age, but had declined somewhat afterward. Located on a strategic site on the Boeotian plain, Thebes had long tried to assert its primacy among the cities in Boeotia, with mixed success. Given our limited sources for Thebes little is known with certainty about much of its history before 490. There is little doubt that although militarily it was a notch below Athens and Sparta for much of the period between 490 and 323, Thebes was still an important city that continued to influence Greek affairs.

By 490, Thebes was a member of the Peloponnesian League. When Darius I sent envoys to Greece it deferred to Sparta. The city played no role at Marathon but was part of the Hellenic League in 480 and sent men to Thermopylae. Herodotus suggests that the city would defect to Persia at the first opportunity, but this impression is likely due to his *History* having been written in Athens when it was in conflict with Thebes. Despite Herodotus' assertion, the Theban troops at Thermopylae probably died fighting in the pass along with the Spartans and Thespians. Thebes contributed men to the

fight at Plataea, on the Persian side.

During the period after 479, Thebes does not appear to have played a strong role outside Boeotia. It fought against Athens in several engagements before 457, but failed to keep it out of Boeotia, where Athens dominated for a decade. Thebes contributed in 447 to ejecting Athens from the regions and then formed the Boeotian Confederacy. Thebes attacked Plataea in 431, at the start of the Second Peloponnesian War. During the war it often asserted dominance in the Boeotian Confederacy by defeating other regional cities. When Sparta declined to destroy Athens at the end of the war Thebes left the Peloponnesian League and remained at odds with Sparta.

During the fourth century Thebes was one of several cities competing for hegemony. It was a major participant and the primary loser in the Corinthian War, ended by the King's Peace in 387/6. The terms of the Peace declared all Greek cities autonomous, a condition Sparta interpreted as requiring dismantling of the Boeotian Confederacy. Chafing under Spartan meddling and a garrison, the Thebans, under Pelopidas' leadership, ejected the garrison and prepared for war. Thebes and Sparta met in 371 at Leuctra where the Thebans won a great victory that broke Sparta's reputation for invincibility.

The victory at Leuctra ushered in a period of Theban hegemony in Greece. In 370, Epaminondas led a Theban force into the Peloponnese where he invaded Spartan territory and although not taking the city he freed the Messenian Helots and dismantled Spartan power. Thebes under Epaminondas' leadership used the opportunity to meddle in the politics of Thessaly and the Peloponnese as well as intimidating other parts of Greece for the next several years. The hegemony lasted until 362 when a large alliance led by Sparta and Athens met Thebes at Mantinea. The battle ended in a draw when Epaminondas died, but it was the effective end of the Theban hegemony.

During the next several decades Thebes was impotent as no Greek city was able to become dominant. In the Third Sacred War when Phocis used its looted wealth to dominate central Greece, Thebes invited Philip II of Macedon to assist (347) and he settled the war the following year. During the Fourth Sacred War, Thebes opposed Philip II and allied with Athens at the battle of Chaeronea, which they lost to Macedon (338). Afterward Thebes became a member of the League of Corinth. When Alexander became king of Macedon and confirmed his leadership of the League of

Corinth in 336 Thebes agreed. However, while Alexander was securing his northern frontier, Thebes revolted when they believed he had died. Learning of the revolt Alexander marched south and after a brief engagement he sacked the city and with League permission razed it to the ground as a punishment (335). Later, at the end of his career, Alexander regretted having destroyed the city.

Cassander rebuilt Thebes and actively fortified the Cadmea in 316. The city turned out to be unimportant militarily during most of the third century, but actively took sides in the wars of the second century. It supported Philip V during the Second Macedonian War (200–196) and supported Antiochus in the Syrian-Roman War of 192–188, but sided with Rome during the Third Macedonian War (171–168), a choice that contributed to the dissolution of the Boeotian League until after the war. When the Achaean League sought support in 146, Thebes joined again. In the aftermath of that failure the Boeotian League was dissolved and Thebes was chastised by Rome. During the first century when Sulla invaded and fought Mithridates' general Archelaus in Boeotia Thebes suffered additional damage from Sulla's army, but was not sacked.

Thebes had been an important city-state during the Classical Period, rising to the dominant position in all of Greece for a while during the mid-fourth century. However, although it was rebuilt, it never regained anything like its previous prominence in Boeotia, much less in Central Greece.

Themistocles (ca. 528–460)

Themistocles, son of Neocles, was an Athenian political and military leader active in the first half of the fifth century. He played the major role in turning Athens into a major Greek naval power in the years before the Second Persian War (480-479) and commanded the Athenian contingent in the Greek fleet during the war.

Marble bust of Themistocles, from the Caseggiato del Temistocle, Roman copy of a Greek original, possibly fifth century. Statues of statesmen were apparently placed in the Athenian Agora only from the fourth century on, and it is impossible to know whether this bust bears any resemblance to Themistocles or, more likely, is an idealized representation. Located in the Ostia Museum, Italy. (Werner Forman/Corbis)

Ancient tradition was that Themistocles came from a non-aristocratic and undistinguished family, had a non-Athenian mother, and came to prominence through sheer ability and force of personality. While there is certainly something in the latter part of this assessment, it seems more likely that Themistocles' family, although undistinguished, was part of the

minor aristocracy. One of the problems is that in antiquity Themistocles was known for his cunning and deceit. Such trickery was in general not a prized attribute for a politician in the literature and Themistocles' eventual flight to Persia did not help. His literary picture therefore tends to be tinged with some hostility, including allegations of greed and extortion. (Thucydides is a welcome exception to this.)

Themistocles first appears in our sources as eponymous archon for 493/2 (i.e., he was the archon whose name was used to date the year)—at that time still an elected and prestigious post. Around this time, he seems to have pushed for a new Athenian port at Piraeus. In 490 he fought in the great Athenian victory at Marathon, perhaps as one of the generals. However, his main claim to fame is his transformation of Athens into a major naval power prior to the Persian invasion of 480. In 483, in the face of opposition from Aristides, he persuaded his fellow citizens to use a large surplus from the silver mines at Laurium to almost triple the size of the navy (from 70 to 200 ships). In later times, this new emphasis on the navy was seen as a major influence on the development of democracy in Athens, probably the basis for the (unfounded) view that he was a radical democrat.

As Themistocles seems to have anticipated, this fleet played a crucial part in defending Greece from the Persian combined land and sea invasion of 480–479. Herodotus at least (8.19, 58ff.) and probably Thucydides (1.74, cf. 1.138) believed that it was Themistocles' plans that delivered Greek success at Artemisium and Salamis in 480. Although Herodotus may be echoing the Athenian version of events—after all, the Spartan Eurybiades was in overall command of the fleet—it is quite likely that his advice would have been listened to—he commanded by far the largest contingent in the fleet and a threat to withdraw it would have been extremely effective.

Despite his successes, Themistocles' influence in Athens waned from 479. He did, however, play a major role in the Athenians' postwar rebuilding of their walls. At some point (Plutarch, *Themistocles* 21) he made himself very unpopular with Athens' allies in the Aegean by levying money from them and by ca. 471 his popularity in Athens itself had declined sufficiently that he lost when an ostracism was put to the vote (see illustration in Ostracism entry). Themistocles went into exile in Argos and when the Spartans accused him of involvement in Pausanias' treasonous pro-Persian plots, he fled to Persia, dying there ca. 460

Theramenes (d. 404/3)

Theramenes was a controversial figure because of his role in the overthrow of the Athenian democracy in 411 and again in 404. Because of his ability to fit with opposing sides of politics, his opponents nicknamed him “the buskin” (a large boot used in stage costumes and which could fit either foot). He came from a well-known family: his father, Hagnon, was the Athenian founder of Amphipolis.

In 411, Theramenes was part of the moderate oligarchic government (the “Five Thousand”) which replaced the democracy. This radical departure from the well-established system failed and Theramenes, who saw the writing on the wall early, helped bring it down.

As a subordinate commander at the battle of Arginusae in 406, he was

one of those tasked by the generals to recover the Athenian survivors. However, they could not be recovered because of a storm. The matter became a cause celebre when the generals were illegally collectively tried and executed for the failure to recover the men. Xenophon clearly believes that Theramenes (successfully) tried to blame the generals for his failure, but a year later Alcibiades was far from critical of him.

At the end of the Second Peloponnesian War, the democracy was overthrown with Spartan help. Theramenes allegedly spun out negotiations with Lysander until Athens was starved into agreeing to surrender and abolish the democracy. He himself became a member of the resulting narrow oligarchy, the “Thirty Tyrants.” However, he fell out with his fellows, especially Critias, over the narrowness of the franchise and the brutality employed.

The Thirty accused him before the council but when it looked as if he would be acquitted Critias intervened, struck him from the list of the Thirty, and sentenced him to death. Xenophon records Theramenes jokingly threw the dregs of his hemlock as if it were wine and he was playing the game *kottabos*, where one toasted the health of a loved one, with the comment “here’s to that lovely fellow Critias” (Xenophon *Hellenica* 2.3.56, Document 13).

Thermopylae, Battle of (480)

Thermopylae, in antiquity (but not today), was a narrow defile (50 feet or 15

meters wide) between the mountains and the sea on the coastal road in Malis and the site of the first land battle in the Second Persian War.

Abandoning a defense further north, the Greek army, in conjunction with the fleet at Artemisium, occupied Thermopylae to block the Persian advance. However, the land component (about 7,000 men) seems woefully inadequate for this purpose. Sparta sent King Leonidas I with 300 men—perhaps the *hippeis* or king's bodyguard. The remainder of the force was drawn from the Peloponnese and from states most immediately threatened if the Persians forced Thermopylae—Boeotia, Phocis, and Locris. The Spartans stated they could only send 300 men because of the Carneian religious festival. This may have been a genuine reason, perhaps reinforced by the view that if Athenians could defeat the Persians at Marathon a small force could hold Thermopylae, at least until after the festival. Similarly, other Greek states did not contribute because of the Olympic festival, and did not expect the Persians to force the pass so quickly. Conversely, Sparta generally did not like committing large numbers of troops outside the Peloponnese and this may also have been so in 480—they certainly were reluctant to do so for the remainder of the war.

On arrival, Leonidas improved Thermopylae's defenses by restoring the Phocian wall there and used the Phocians to secure a mountain track above the pass (the Anopaeian track) which could be used to outflank his main position. Unaware of this track and restricted by the terrain, the Persians were reduced to making frontal infantry assaults in a confined space. As at Marathon, Greek hoplites proved individually superior to the more lightly armed and armored Persians. Although the Persian army probably had at least a 50:1 advantage and perhaps significantly greater (but the 2.6 million fighting men in Herodotus 7.186 is clearly exaggerated) it made no headway for several days while suffering severe losses.

When a local, Ephialtes, offered to guide them over the Anopaeian track, Xerxes sent a force along it to outflank the Greeks. This maneuver was successful—the Phocians guarding it were simply bypassed, but were able to warn the main body. Leonidas sent most of his force home. The remainder (700 Thespians, 400 Thebans, and the 300 Spartans) fought to the end. The fighting was so fierce that Herodotus (7.223) records that the Persian officers had to use whips to force their men against the Greeks, who were reduced to fighting with their bare hands when their weapons broke. Greek tradition, recorded by Herodotus, and probably influenced by Thebes' later

desertion to the Persians, was that the Thebans were forced to stay and surrendered as soon as they could. Once the pass was turned, the Greek navy at Artemisium was also forced to withdraw and the Greeks set their next defensive line at the Isthmus of Corinth. Despite the defeat, the heroic stand boosted Greek morale and significantly enhanced Sparta's reputation.

Thessaly, Thessalians

The region of Thessaly is located in northern Greece on the southern borders of Macedonia. Topographically, Thessaly is made up of two large plains: the Larissa and Trikala lowlands. These plains are ringed by mountains, which include the Pindus, Ossa, and Pelion ranges, as well as the Olympus Massif. These mountains have a significant influence on the climate of the region: Thessaly has a continental climate with hot, dry summers and cold winters, with extreme variations in temperature between the seasons. On account of its topographical setting, Thessaly only has access to the Aegean Sea through the Gulf of Pagasae with its two ports: Volos (Iolcus/Pagasae/Demetrias) and Almyros (Pyrasos/Demetrion). The Thessalian plains are blessed with deep, fertile soil that produces a surplus of grains and cereals. Likewise, the rich grazing provided by the plains supported large herds of horses, cattle, and sheep in antiquity. Thessaly was renowned for its horses and cavalry, and it is no surprise that the region was supposed to be the home of the mythical Centaurs.

The agricultural and pastoral potential of Thessaly made it one of the

earliest continually inhabited regions in mainland Greece. Over 400 Neolithic sites have been uncovered in the region as well as several Bronze Age/Mycenaean sites, the most important of which are Dimini and Iolcus (home of Jason of the golden fleece/Argonautica fame).

Beginning ca. 1000, a group of people who called themselves the “Thessaloi” began moving into the plains of Thessaly and established control over the existing population. These Thessaloi founded a system of aristocratic rule centered in the cities. Each major city—the most important of which were Larissa, Crannon, Pharsalus, and Pherae—was controlled by a specific aristocratic family. The most notable of the families were the Aleuadae and the Scopadae. These powerful aristocratic families were known for their love of horses and horse racing, and many acted as patrons to poets like Pindar, Simonides, and Anacreon. The entire region was organized into a federation controlled by a single chief/*archon*. By the seventh century, Thessaly had become one of the most successful and stable federations of the Archaic Period.

In the second half of the sixth century a member of the Aleuadae—Aleuas the Red—reorganized the Thessalian state. He split the region into four tetrarchies: Thessaliotis, Hestiaetis, Pelasgiotis, and Phthiotis. Each tetrarchy was ruled by a tetrarch. The tetrarchies were further organized into *kleroi* (land allotments), each of which were expected to provide an allotment of troops for the state army, which was led by the *tagos*. As a result of these reforms, and its dominance of the Delphic Amphictyony, Thessaly was the major power of northern Greece for much of the sixth century. Thessaly formed an alliance with the Athenian Peisistratidae and sent a cavalry force to assist them against a Spartan expedition in 511.

During Xerxes’ invasion of Greece Thessaly was one of the territories to medize and join the Persian side. This was done upon the instigation of several members of the Aleuad family, especially after the Thessalians considered themselves abandoned by their allies.

Throughout the fifth century the old aristocratic families remained powerful, but their political control was slowly being undermined as a result of personal rivalries and a growing demand by the ordinary citizens for a say in local government affairs.

Following the battle of Leuctra in 371, the Boeotians became increasingly more involved in Thessalian affairs. Thessalian cavalry and peltasts fought under Epaminondas during the first Boeotian invasion of the

Peloponnese. Interfamily rivalries came to a head in the early fourth century when the cities of inland Thessaly (later the Thessalian League established by the Boeotian general, Pelopidas) began to rise up against the tyrants of Pherae and turned to Boeotia and later Macedonia for help. When the tyrant Alexander of Pherae was assassinated in 358, the Larissans were quick to take advantage of the situation by inviting Philip II of Macedon to intervene in Thessalian affairs. Macedonia had long viewed Thessaly as a potential problem as the 8-kilometer (5-mile) long Vale of Tempe in northeast Thessaly provided an easy access route into Macedonia, and the opportunity for a formal alliance with the Thessalians was seen as very favorable. Philip's alliance with the Thessalian League led to his involvement in the Third Sacred War when the Amphictyonic Council (of which Thessaly was a member) declared war on Phocis.

Following Philip's intercession in Thessalian affairs the Thessalian cavalry became a mainstay in the Macedonian army. It played a significant role in many of Alexander the Great's battles, where it was typically placed on the left wing. The Thessalians and their cavalry continued to support the Macedonians, except during the Lamian War (323–322) when they sided with the Athenians and their allies against Antipater and the Macedonians. After the Athenians and their allies were defeated, Antipater and Craterus began to lay siege to the Thessalian cities, which quickly rejoined the Macedonian side.

By the third century, Thessaly was split between different powers: the Macedonians ruled part of the region, the other part was controlled by the Aetolian confederacy. From this point onward, Thessaly increasingly became a battlefield for "foreign" wars—especially those of the Romans. It was made part of the Roman province of Macedonia in 148.

Thibron (d. ca. 391)

A Spartiate who was the first commander of the army Sparta sent to Asia Minor in 399 to prevent Tissaphernes bringing the Greek cities of Asia Minor back under Persian control after Cyrus' rebellion. His record shows how few able commanders Sparta could call upon.

After limited success Thibron was ordered by the ephors to invade Tissaphernes' own satrapy, Caria, but was replaced by Dercylidas. He went into exile after being condemned for letting his troops plunder their own allies. Apparently Sparta had not arranged adequate finance or supplies for the expeditionary force. Thibron also did not see the need for adequate cavalry in a war in Persian territory.

When Sparta resumed the campaign in Asia Minor in about 391, Thibron was in command, again. With local troops he raided Persian territory until he negligently let his troops be surprised by Persian cavalry and was killed.

Thrace, Greek Cities in

Thrace, the region between the Aegean Sea and the Danube River, and also the area surrounding the Propontis, or Turkey's Sea of Marmara, was home to many Greek settlements. Beginning with the Athenian Peisistratus in the 550s, if not even earlier, the Greeks established many colonies in Thrace to secure natural resources, including gold and timber, and access to important shipping routes and the passage between Europe and Asia. Most Greek cities were located along the coast, on the periphery between the Greek and Thracian worlds, but there were a few settlements further inland, such as Pistiros, a recently excavated trading post. Because of their strategic location, these settlements were frequently the focus of military conflict. The Greeks also used these settlements as recruiting and mustering grounds for Thracian mercenary soldiers, especially light-armed peltasts.

The city of Amphipolis, established by Athens in 437/6, provides an excellent example of the importance of and conflict surrounding Greek cities in Thrace. Located along the Strymon River, Amphipolis was a crucial source for ship-building timber, and afforded access to the valuable mines of Mount Pangaeum. The Athenians finally established the city only after several previous Greek attempts, beginning before the Persian Wars, had failed. Amphipolis was the cause of great conflict, with Sparta seizing the city in 424, during the Second Peloponnesian War, and Athens trying to regain it by sending several unsuccessful military expeditions over the next several decades.

Two other Greek cities in Thrace feature prominently in Greek warfare. Potidaea, a subject of Athens, revolted from Athenian control and was instrumental in causing the outbreak of the Second Peloponnesian War in 431. Olynthus, another city of importance to Athens, was besieged and destroyed by Philip II of Macedon in 348, further inflaming tensions between Athens and the growing Macedonian Empire. Thrace continued to play an important role even after the conquests of Alexander the Great. In 309, one of the Successors of Alexander, Lysimachus, founded a city in Thrace which he called Lysimacheia, to serve as a strategic center against his rivals in the great struggle for control of Alexander's empire. It is no exaggeration to say that the military history of the fifth and fourth centuries centered largely on the Greek cities in Thrace and the efforts undertaken by major powers to secure influence in the region.

The Greek cities in Thrace provided mercenary soldiers to the major Greek powers on several occasions. As seems likely, these mercenaries were often Thracian, rather than Greek, soldiers, though mustered in Greek cities. Many of the light-armed soldiers used by the Athenians to defeat the Spartans at Pylos in 425, for example, were from Greek cities in Thrace such as Aenus. These Greek cities were also centers of military innovation, based on their experience with native Thracians. The Greeks of Abdera, for instance, developed a skilled cavalry force, rare in mainland Greece, to contend with the horse-loving Thracians.

Thrace, Thracians

The Greeks considered Thrace to be the region between the Aegean Sea and the Danube River, roughly modern Bulgaria and northern Greece, and also the area surrounding the Propontis, or Turkey's Sea of Marmara. The Romans later organized these regions into the administrative province of Thrace. The Thracians was the name given by the Greeks to the many distinct groups of peoples, or tribes, who lived in Thrace, all of whom spoke their own native languages and practiced their own customs. Though there was not one Thracian nation or ethnicity, the various Thracian groups did share many similarities in cultural practices, social organization, dress, and fighting style. Some of the more prominent Thracian groups were the Triballians, Bithynians, Getans, and the Odrysians. The latter group managed to consolidate many different tribes into one larger kingdom,

known as the Odrysian Kingdom of Thrace, for much of the later fifth and into the fourth century. Thrace and the Thracians, especially the light-armed fighter known as the peltast, were very important to the development of Greek warfare.

The Thracians did not leave any written sources of their own, so we know of them primarily through Greek (and later, Roman) sources—including literature, sculpture, and vase painting—as well as from the material finds of archaeological excavation in Thracian lands. The Greeks stereotyped the Thracians as savage and exceedingly warlike, an image that is not entirely inaccurate. The Thracians lived primarily in scattered villages rather than developed city-states, often in rugged mountainous areas; achieved only very limited and brief political unity; and were famous as skilled and fearsome mercenary soldiers. Thracians also made up a large portion of the slaves in Greek states, especially at Athens. Aside from mercenary soldiers, the Greeks were interested in Thrace because of its vast natural resources, including gold and timber, and the strategic location of many Thracian territories along principal trade routes, including the Hellespont, or Dardanelles. There was therefore a great deal of Greek settlement in Thrace, including important city-states along the northern coast of the Aegean Sea, and trading posts further inland.

Thrace featured prominently in many Greek conflicts. Thrace was under Persian control during the Persian Wars, and contributed soldiers to Xerxes' invasion force. During the Second Peloponnesian War, Athens was allied with the Odrysian king Sitalces, and Sparta deprived Athens of its Thracian settlement of Amphipolis and defeated Athens decisively at Aegospotami in the Hellespont. After the war, Thracian troops took part along with the Ten Thousand in Cyrus' expedition against his brother, Artaxerxes II, fighting at the battle of Cunaxa. On their return, the Ten Thousand hired themselves out to the Odrysian leader Seuthes. In the early fourth century, the Athenian Iphicrates defeated Spartan hoplites at Corinth with a group of mercenary peltasts who probably originated from Thrace; Athens and Sparta fought each other for influence in the Hellespont; and Athens tried in vain to recover Amphipolis. Later, Thrace was a focus of the expansionist policies of Philip II of Macedon, bringing him into conflict with the Greek settlements in the region, and with Athens, which tried unsuccessfully to maintain its own position in Thrace.

As warriors, the Thracians were known both as horsemen and as light-

armed skirmishers armed with javelins. In the *Iliad*, the Thracian king Rhesus, an ally of the Trojans, is famous for his prized horses, which are stolen by the Greek heroes Odysseus and Diomedes. But the Thracian warrior that had the greatest impact on Greek warfare was the peltast, a javelin-thrower named for his distinctive crescent-shaped shield, the *pelte*. Peltasts relied on their relatively light armor to swarm against an enemy, either as individuals or in small groups, to hurl their javelins and then retreat at ease, before coming in for another attack. During the Second Peloponnesian War, the Greeks began to appreciate the usefulness of this type of soldier as a complement to the heavy-armed Greek hoplite. Mercenary Thracian peltasts became a regular feature in Greek armies, particularly in the fourth century, and it seems that Greeks themselves were sometimes equipped as peltasts. In the *Anabasis*, Xenophon describes the ways he tried to integrate Greek hoplites with the more mobile peltasts and cavalry of Seuthes, prefiguring the type of combined-arms force perfected by Philip II of Macedon and Alexander the Great. In 390, at Lechaeum, Iphicrates demonstrated that disciplined peltasts on their own could defeat hoplites. One group of Thracian mercenaries, the Dii from the Rhodope mountain range in modern Bulgaria, was conspicuous in being equipped with sabers, *machairai*, instead of javelins. These mercenaries, hired by the Athenians, committed one of the worst atrocities of the Peloponnesian War when they slaughtered all the men, women, children, and even the livestock of the defenseless Boeotian town of Mycalessus in 413.

Thrasybulus (d. 388)

Thrasybulus, son of Lycus, was an Athenian general and democratic politician active in the last stages of the Second Peloponnesian War and the Corinthian War. In 411, while a trierarch (commander of a ship) in the Athenian fleet at Samos, he organized against the oligarchs who had seized power in Athens and was elected *strategos* (general) by the sailors. He appears in 410 commanding 20 ships, later campaigning on the Thracian coast (407) and in the Hellespont (406). Xenophon paints an unflattering picture of his role as trierarch at Arginusae (406) and in the post-battle trial and execution of six *strategoi*.

Thrasybulus was exiled by the Thirty Tyrants and played a major role in the restoration of democracy by occupying first Phyle and then the Piraeus. Thrasybulus was killed toward the end of the Corinthian War by locals at Aspendus, enraged because his troops had looted their property even though they had paid a contribution to avoid this. Although best known for his staunch defense of the democracy, Thrasybulus was also a competent commander on both land and sea.

Thrasyllus (d. 406)

An Athenian *strategos* (general) and democrat active during the later stages

of the Second Peloponnesian War (431–404). Thrasyllus first comes to attention with Thrasybulus in the Athenian fleet in Samos as a leader of the democratic opposition to the oligarchic coup in 411.

Thrasyllus commanded the left wing of the fleet in the victory over the Peloponnesians under Mindarus at Cyzicus (410) but was defeated on land at Ephesus (409). Following that, he successfully worked alongside Alcibiades for the rest of the campaigning season. Reelected *strategos* in the command restructure following Alcibiades' defeat at Notium in 406, Thrasyllus served at Arginusae the same year and was one of the six *strategoi* executed after the battle.

Thucydides (ca. 462–after 404)

Thucydides wrote one work, a history of the war fought from 431 to 404 between the Athenians and the Spartans and their allies, now known as *The Peloponnesian War*. The rigorous historical method and explicit attention to accuracy that Thucydides set himself defined standards for historical research and greatly influenced historians that were to follow him in the Greco-Roman world. Thucydides' narrow focus on politics and war established them as the primary subject for history. His historical principles laid the foundations for modern historical method.

Thucydides was an Athenian. His father's name was Olorus and his mother's Hegesipyle. He had a son named Timotheus. He was a member of the same aristocratic family as the distinguished Athenian generals Miltiades II and Cimon. His father's name and the fact that he owned

mining concessions in Thrace suggest that he may have been related to Thracian aristocracy too. His dates cannot be determined for certain: in antiquity he was believed to have been born 40 years before the outbreak of the Peloponnesian War in 431; this is a reasonable supposition, probably derived from Thucydides' own statement that he was old enough to follow the course of the entire war and that he fought in it himself. He also tells us that he caught and survived the plague of 429 and was appointed to the rank of *strategos* (general/admiral) in 424. This was a prestigious and powerful position; 10 *strategoí* were elected each year by the Athenians for an annual term. It was the highest military position in Athens, brought with it great political influence, and was a role reserved at that time for wealthy and influential citizens. However, Thucydides fell from favor and was sent into exile for 20 years after failure in his command in the Thraceward area, where he lost the key city of Amphipolis to the Peloponnesians. He tells us that his exile allowed him more free time for his research and gave him better access to Peloponnesian sources of information. He recorded the end of the war, but did not finish his history, leading to speculation in antiquity that he died a sudden and probably violent death, perhaps on his way home from exile. Thucydides himself suggests that he saw the remains of the walls of Athens after they had been pulled down in 404 and other sources believe he was recalled with other exiles before the end of the war.

The Peloponnesian War is a narrative history, structured chronologically by each year of the war, summer and winter. The current division of the work into eight books dates from the Hellenistic Period. Book 1 describes events leading up to the outbreak of the war, and includes a brief survey of Greek history down to the Persian Wars (the "Archaeology"), and from the Persian Wars down to the outbreak of the Peloponnesian War (the "Pentecontaetia"). The first 10 years of the war (431–421), known as the "Archidamian War" after the Spartan king Archidamus II, are narrated in Books 2–4. In Book 5, Thucydides describes the Mantinean War, the subjugation of Melos and other military and political actions that took place during a period in which Athens and the Peloponnesians were formally at peace (the "Peace of Nicias" 421–414/3). Books 6–7 describe the Athenian campaign in Sicily (415–413) and the renewal of the war with the Peloponnesians. In Book 8, the Ionian War, the final phase of the Peloponnesian War (also called the "Decelean War"), and the oligarchic coup in Athens are described down to 411, where the narrative breaks off.

Xenophon, a younger contemporary of Thucydides, completed the narrative of the war to 404 in his *Hellenica*.

Thucydides describes land and sea military operations that took place during the Peloponnesian War. Despite his focus on hoplite numbers as a way of defining the strength of a *polis* there were few major battles in this war in which hoplite phalanxes fought against each other. The “greatest battle for a long time,” according to Thucydides, was the battle of Mantinea in 418 and he describes this in some detail. Descriptions of other phalanx battles include Syracuse in 415/4 and Delium in 424. Thucydides’ description of the shock surrender of Spartan *hoplites* to peltasts (light troops, typically armed with a javelin and without the heavy hoplite shield) and archers on Sphacteria in 425 testifies to the effectiveness of such troops in battle on rough terrain but seems to have surprised the historian himself.

Thucydides gives detailed accounts of attempts, both successful and unsuccessful, to capture walled cities. He understood that lengthy sieges with circumvallation were difficult, expensive, and even when well-resourced may not be successful: his fullest example is the siege of Syracuse 414–413; other sieges he describes include Potidaea (432–429) and Plataea (429–427). Thucydides understood that a surprise attack at night, where a city is betrayed from within, was an effective and more efficient way to capture a city, and he gives full descriptions of this strategy too: Torone (424) is a good example; Plataea (431) an example where the initial betrayal and attack failed.

Thucydides recognized that significant power and wealth were derived from naval power. Thucydides had a naval command himself and reveals familiarity with trireme warfare. He provides a good description of naval battle tactics in the account of the engagements off Patrae and Naupactus in 429; “old fashioned” tactics are addressed in the description of the battle of Sybota (433) and developments in ship design and strategy in the account of the battle in the Great Harbor of Syracuse (413).

Thucydides shows a keen perception of the politics of war. While able to draw out the motivation of individual politicians such as Pericles, Cleon, and Alcibiades, and the role of personal politics in directing a state’s war policy, he was also able to look at the bigger picture, at what drove states as collective political bodies to engage in war.

Thucydides, Son of Melesias (Mid-Fifth Century)

Thucydides son of Melesias (possibly the grandfather of the historian Thucydides) was a prominent aristocratic politician in Athens in the middle of the fifth century. Known best for being the last serious opponent of Pericles, Thucydides was ostracized, probably in 443/2. Although he returned in 433/2 he was apparently unable, or unwilling, to take Pericles on again at anywhere near the same level as before.

According to Plutarch (*Pericles* 11), Thucydides introduced the innovation of having all his supporters sit together in the *ecclesia* (assembly) to emphasize their numbers. He is often simply regarded as the leader of oligarchically-inclined Athenians but it has been argued (e.g., by Hignett and de Ste. Croix) that his supporters were the conservative democrats who had once followed Cimon. Aristophanes certainly only refers kindly to Thucydides in his extant plays. Thucydides is known for his criticism of Pericles' major building works, financed from the Athenian Empire. It is generally believed that the criticism recorded by Plutarch (*Pericles* 12.2) that

“...we are gilding and beautifying the city like some painted woman surrounding herself with hugely expensive precious stones, statues, and temples” originated from Thucydides himself.

Thucydides’ career illustrates that Pericles did not entirely have it his own way at Athens. Although he should probably not be taken to be a leader of “the oligarchs” the seriousness of the opposition led by Thucydides also shows that there could be considerably divergent opinions within the democracy.

Timaeus (ca. 350–ca. 260)

Timaeus of Tauromenium in Sicily was the author of the major history of the western Greeks. Exiled ca. 315 by Agathocles, tyrant of Syracuse (on whom he poured vitriol in his writings), Timaeus spent 50 years in exile at Athens.

None of his works survive except in excerpts and quotations. His *Olympionikai* ("Olympic Victors") was a chronological work based upon the four-year interval between each celebration of the Olympic Games, these celebrations being themselves numbered. Timaeus was the first to use this Olympiad-based chronology in historical writing. After him, it became standard, since its timeframe could be applied across the whole Mediterranean world.

Timaeus' 38-book *Sicelica* ("Sicilian History") also covered Carthage and Greek and other cities in Italy, including Rome. It extended from earliest times down to the death of Agathocles (289). Timaeus supplemented this with a separate work on Pyrrhus' wars in Italy and Sicily. The end point of this (264) was where Polybius took up the record.

Timaeus' vast history dealt not just with military history: he was interested in mythology, geography, ethnography, and curious natural phenomena. Herodotus was an obvious model. He criticized other historians sharply and was in turn sharply criticized by, among others, Polybius (12.23–28). He was thought to be excessively bookish, lacking experience of war and politics and overly given to fault-finding. He was also regarded as too kind to those he admired, such as Timoleon, and too harsh on those he hated, such as Agathocles. The criticism shows that his work was standard and irreplaceable. Later writers, such as Diodorus Siculus, Strabo and Plutarch, used it extensively. Timaeus aimed to give the history of the western Greeks a full-scale treatment that matched its intrinsic importance but was missing in mainstream Greek historical writing.

[Timoleon \(d. ca. 334\)](#)

In 345/4, the Sicilian Greeks appealed to Corinth, mother city of Syracuse, for help to rid themselves of Dionysius II. The Corinthians sent Timoleon who, while at Rhegium, received word that Hicetas of Leontini had defeated Dionysius II in battle and had him bottled up on Ortygia, the Syracusan acropolis, and also that Hicetas had thrown in his lot with the Carthaginians. The Carthaginians ferried envoys from Hicetas to meet with Timoleon. The Rhegians, keen to aid Timoleon, helped to deceive the Carthaginians long enough to allow Timoleon to slip away from Rhegium and land at Tauromenium with a small force of 700 mercenaries. Timoleon, whose force had grown to some 1,200 men, caught the 5,000 strong force of Hicetas while they were pitching camp near Hadranum and defeated them. Timoleon's victory brought him further support and he then took control of Syracuse, introducing a moderate oligarchic constitution and exiling Dionysius II to Corinth. Timoleon went on to abolish tyrannies in other Sicilian Greek cities too.

In the spring of 341, the Carthaginians with an escort of 200 warships landed a huge force, supposedly consisting of 70,000 men, and 1,000 transport vessels carrying artillery, four-horse chariots, and provisions at Lilybaeum on the west coast of Sicily. Timoleon decided to meet the enemy before it could venture into Greek territory and in a superb piece of generalship managed to catch the Carthaginians while they were crossing the Crimisus River. During the battle a hail and thunderstorm broke overhead and the hail flew into the faces of the Carthaginians. The battle was a resounding victory for Timoleon and allegedly between 10,000 to 12,500 Carthaginians perished with a further 15,000 being taken prisoner. The victory also brought a huge haul of booty. The Carthaginians sued for peace and accepted that all Greek cities of Sicily were to be free and that they would not aid tyrants who were at war with Syracuse.

Timoleon then set about expelling various tyrants from within Sicily and also sent word throughout Greece calling for new colonists to settle in Sicily. Timoleon also revived various Sicilian Greek cities including Camarina, Gela, and Acragas. He died ca. 334.

Timotheus (ca. 415–354)

Timotheus, son of Conon and a student of Isocrates, was an Athenian *strategos* (general) active in the second quarter of the fourth century. A highly competent military commander but consistently hampered by Athens' lack of resources, he had an unfortunate tendency to alienate allies and, perhaps, to exceed his orders.

First elected as *strategos* (general) in 378/7, the year the Second Athenian Confederacy was founded, Timotheus was regularly elected *strategos* after that, his career closely linked with Athens' efforts to regain naval power and empire. In 375, during an expedition with Chabrias to northwest Greece, Timotheus heavily defeated the Spartan fleet at Alyzia. This expedition, and more particularly the victory at Alyzia, caused Corcyra, and several other states, to ally with Athens and Sparta to make peace. However, the following year Timotheus broke the terms of the peace when he restored exiles to Zacynthus, precipitating a new war Athens could not really afford.

As general in 373, Timotheus was sent with 60 triremes, but insufficient funds and crew, to Corcyra. Timotheus' solution, to sail the islands raising money, caused so much delay he was recalled in disgrace. Supported by Jason of Pherae and the king of Molossia, Timotheus was acquitted but in 372 prudently left Athens to serve as a mercenary commander in the Persian attempt to recapture Egypt.

In 366, Timotheus was back in Athens, reelected as *strategos*, and apparently a major driver of Athens' more aggressive policy which led to hostilities with Persia and ultimately helped precipitate the Social War in 357. His establishment of a cleruchy (military colony) on Samos was a major factor in causing the allied unrest that led to the war, but his interference in Erythrae, part of the Persian Empire, did not help either.

Timotheus' career ended in 356 following the Athenian defeat at

Embata. The defeat seems to have been the fault of Chares, who launched an attack against the advice of his fellow generals, Timotheus and Iphicrates. They were forced to follow his unilateral assault and were then put on trial after Chares denounced them for not supporting him. Iphicrates was acquitted but the less popular Timotheus was fined the huge sum of 100 talents. Unable to pay he went into exile and died in 354. After his death he was rehabilitated at Athens and his fine, inherited by his son, significantly reduced.

Tiryns

Tiryns, situated in the southern Argolid, was one of the main walled Mycenaean “palace” communities. There is a range of archaeological remains of settlement dating back to around 2800. After 1400 typical Mycenaean features emerge, such as a great gate and two *megara*, or halls with central hearths and decorated with fine frescos, one colonnaded. Its cyclopean walls were renowned. In Homer the city is given the epithet of “great-walled Tiryns” (e.g., *Iliad* 2.559). The myths generally explained the massive walls and tunnels as the work of the Cyclopes.

The mighty Bronze Age fortifications of Tiryns. The site was on a small rocky hill, in antiquity less than one mile from the coast. In the 13th and 12th centuries, the city was one of the great centers of the Mycenaean world, but by the time the traveler Pausanias visited in the second century CE, the site was deserted. (Photo by Peter Londey)

In the late thirteenth century, Tiryns, like Athens and Mycenae, reveals evidence of preparations for siege. The palace was burnt in the Late Helladic IIIB period, suffering a similar fate to other Mycenaean centers. Despite its destruction, Tiryns continued to be occupied until the Classical Period. It sent troops to the battle of Plataea in 480. About 12 years later, it was destroyed by Argos, which dominated the Argolid in Classical times. The survivors fled to Halieis. Argos, which also destroyed Mycenae at this time, seemed jealous of the fame of the two ancient Mycenaean citadels and was keen, as the new regional hegemon, to be seen as the successor of past Mycenaean glory. When Pausanias visited around 150 CE, Tiryns was deserted. Heinrich Schliemann, who was also the first major excavator of Mycenae and Troy, dug Tiryns in 1884–1885.

Tissaphernes (d. 395)

Tissaphernes was a Persian noble and satrap (governor) of Caria, but with overall command of the coastal satrapies or provinces of Asia Minor from 413–408 and 401–395. We know something of him as his command coincided with the latter stages of the Second Peloponnesian War (431–404) and Sparta's post war operations in Asia Minor. Unlike his colleague and subordinate Pharnabazus, who receives a more favorable portrait, Tissaphernes comes across in the Greek sources as an able intriguer whose word could not be trusted.

On Alcibiades' advice, during the end stages of the Peloponnesian War Tissaphernes attempted to keep Athens and Sparta on a par. This involved providing sufficient support to the Peloponnesian fleet to allow it some success against the Athenians, but not enough to allow a decisive victory. This playing off of the two sides against each other helped create Tissaphernes' reputation with the Greeks for being less than honest. In September 411, the Spartan admiral Mindarus was so frustrated by Tissaphernes' prevarications and partial support that he aligned with Pharnabazus.

In 408/7, Tissaphernes' career went into temporary decline. His brother unsuccessfully conspired against Darius II and although Tissaphernes retained his satrapy of Caria (and his life) he was demoted from overall command. Cyrus the Younger replaced him, reversed his policy and began wholehearted support of Sparta.

Tissaphernes' relationship with Cyrus rapidly deteriorated into open conflict. When Cyrus revolted against his brother, the Great King Artaxerxes II, Tissaphernes served alongside Artaxerxes at the battle of Cunaxa (401) and afterward treacherously seized and murdered the generals commanding Cyrus' Greek mercenaries. This also added to his poor reputation with the Greeks, but his loyalty to Artaxerxes regained him the

overall command of coastal Asia Minor and marriage to the king's daughter. His skillful diplomatic maneuvers for a time ensured that the Spartan operations against Persia from 399 under Thibron, Dercylidas, and Agesilaus II focused on the territory of his subordinate, Pharnabazus.

Tissaphernes' luck eventually ran out in 395 when Agesilaus heavily defeated him at Sardis. Artaxerxes had him executed soon afterward.

Tolmides (d. 447)

Tolmides, son of Tolmaeus was an Athenian general (*strategos*) active in the mid-fifth century. At the time his reputation rivaled Myronides (and his slightly younger contemporary, Pericles). In 456, during the First Peloponnesian War Tolmides led a major naval expedition around the Peloponnesian coast, taking Methone, burning the Spartan docks at Gytheum, taking Zacynthus and bringing Cephallenia into the Athenian alliance. He also took Naupactus and settled the Messenian rebels from Mount Ithôme there. Around 453 he campaigned successfully in Euboea, establishing 1,000 Athenian cleruchs (military settlers) there.

His successful career ended in 447 during Athens' attempts to secure control of western Boeotia. Tolmides was sent with a small force (1,000 hoplites) to restore recently overthrown pro-Athenian democracies there. Although he recaptured Chaeronea, a force of exiles from Orchomenus, assisted by others from Locris and Euboea attacked him on his way home.

Tolmides and many of his men were killed and the remainder captured.

Training

Modern militaries consider “individual” and “collective” training critical to delivering combat capability. Individual training encompasses the initial recruit and trade or officer training, specialist and promotion courses, and formal staff training. This is designed to ensure individual competency in the job requirements. Collective training is aimed at ensuring groups, whether sections or squads, ships, sub-units, or formations such as brigades, divisions, or fleets, are able to perform their tasks effectively. Prior to engaging in combat it is usual to conduct “pre-deployment training” to prepare the force element for the specific theater or mission they are about to undertake.

Although the concept of training did develop over time in ancient Greece (and was always dominant at Sparta where the *agoge* was designed to produce high-quality hoplites), for land forces it was pretty limited until the second half of the fifth century. In broad terms, individual training was seen as the responsibility of the individual, not the state, and collective training was quite basic. This was particularly the case during those periods and in those parts of Greece where hoplites were the dominant troops and hoplite warfare the dominant form of combat.

This is not surprising as (with the exception of Sparta and the elite troops other states established in the fifth and fourth centuries) states did not have professional standing armies. Instead, most state hoplite forces were citizen soldiers who reported for duty when required. Traditional

hoplite warfare involved short sharp campaigns, usually resolved in one battle; in between the majority of hoplites were small farmers or tradesmen who had to earn a living and therefore had little time for training.

Other barriers to training included the desire to avoid onerous activity or the view that it was unnecessary—or even damaging to the spirit of free men. Pericles, for example, espouses the amateur ideal, rejecting Sparta's devotion to training, stating that while Spartans "...undergo a painful regime from birth to instill manliness, we live without these restraints but are just as willing to face danger" (Thucydides 2.39.1). Down to the fourth century, other Greek states largely seem to have been prepared to accept Spartan hoplite superiority rather than institute their own rigorous training regimes. Finally, hiring experienced mercenaries could reduce the need for highly trained citizen forces.

However, as warfare became more complex and less hoplite-oriented, training became more commonplace. Thucydides (6.72) casually notes the link between training and success in war and, as noted, several states (including Thebes and Argos) established standing hoplite contingents trained at state expense. The evidence is often severely limited outside Athens and there are dangers in extrapolating Athenian evidence to other cities. Nevertheless, professional teachers of hoplite weapons are attested in late fifth century Athens and the Athenians also held occasional hoplite reviews involving drill and maneuver demonstrations. It seems likely that this would also be true of other Greek states. In the fourth century Athens also instituted the *ephebeia*, a two-year training program for youths. This included performing garrison duty on the frontiers—although Demosthenes' *Against Conon* suggests discipline was not always good (Document 18).

Athenian red-figure *kylix* depicting training, by the Pistoxenos Painter, ca. 480–460. The men have shields, helmets, and greaves, and are probably training for the *hoplitodromos* (hoplite race) run at the Olympics and other games. In combat, hoplites were also equipped with a spear and generally also with a sword and breastplate. Located in the Antikensammlung, Staatliche Museen, Berlin, Germany. (Photo by Ingrid Geske/Art Resource, NY)

Evidence also exists for the training of specialist troops. Archers and slingers were generally sourced from specialist mercenaries or, if citizens, probably learned their skills as shepherds and hunters and did not need much individual training. However, at Athens at least, there was a cavalry training regime. Xenophon's manual for cavalry commanders (*Hipparchicus*) emphasizes individual and collective training—although he complains not enough training was being conducted. This included the *anthippasia*—a mock cavalry battle between squadrons, conducted at festivals, and with a prize for the best squadron. Mounted javelin practice is also attested on several Attic vases. Given the technical aspects of cavalry warfare it seems highly likely training occurred elsewhere. Even in Thessaly and Macedon, where the large numbers of horsemen reduced the need for individual training, formation maneuver and individual weapons practice would have been required to maintain appropriate standards—even prior to the professionalization under Philip II and Alexander.

The introduction of new troop types such as peltasts, or later the

introduction of the Macedonian *sarissa*-armed phalanx in Greece, must have required training. This is confirmed by the Egyptians who spent 12 months training their newly created phalanx, which performed very well at Raphia (217). The equivalent of predeployment training is also attested, for example Agesilaus II in Asia Minor in 396.

The education of officers was limited to on the job experience, mentoring by older officers, collective training, such as the *anthippasia* or hoplite reviews at Athens (which involved basic maneuvering), or reading. General historians such as Herodotus and Thucydides focused on military matters, and from at least the fourth century specialist military treatises were written (works of Xenophon are early examples). Interestingly, despite this, Alexander the Great is reputed to have carried Homer's *Iliad* with him as his manual. However, unlike his Greek counterparts, Alexander had gone through the Macedonian royal page system, which did provide a military education. In his case this was supplemented in his first campaigns by mentoring from experienced generals. Alexander is recorded as giving his troops rigorous training; the complicated drill maneuvers they executed to overawe the Taulantians attest to the results. The professionalization of the Macedonian army under Philip II and Alexander the Great was based on training as well as experience and this seems to have influenced Alexander's Successors, the *diadochoi*.

Presumably naval training, at least at the individual ship level, was always taken seriously—a ship's captain had to rely on the seamanship of his entire crew from the helmsman to the rowers to avoid risk of shipwreck whether in or out of combat. Sophisticated naval maneuvers such as the *diekplous* must have required collective training to execute properly and there are some examples of such training in the ancient sources. Xenophon's *Hellenica* approvingly notes Iphicrates training his fleet during a voyage around the Peloponnese (373/2). Dionysius of Phocaea had instituted a rigorous training regime for the Greek fleet before the battle of Lade (494) but they found it too onerous and gave up after a week.

Treatises, Military

Ancient Greek military manuals, commonly termed *taktika* or *strategika* (on tactics and generalship), *polior-ketika* (siegecraft), or *belopoiika* (artillery), are characteristic of a theoretical approach to warfare and important sources for historical research. This genre emerged in the fourth century as a result of diverse literary, cultural, and military factors. War forms the background to the earliest Greek literature in both verse and prose. From an early date the Homeric poems were regarded as a repository of military wisdom. Herodotus and Thucydides established warfare, its causes, course, and impact, as the primary interest of historical writing, which provided models of generalship, stratagems, and tactics. The second half of the fifth century witnessed a growth of literary culture and the systematic writing down of knowledge previously transmitted orally. This encouraged a diversification of texts on scientific and technical subjects, including medicine, politics, household management, hunting, and equestrianism. The earliest texts devoted to military matters were possibly

compiled in Athens toward the end of the fifth century by sophists, professional instructors who taught various arts or skills (*technai*) to prepare wealthy clients to assume civic and military offices. The sophists were the first to teach tactics and weaponry drills, and although critics accused them of rhetorical and abstract teaching methods, their educational ideals promoted the acquisition and propagation of specialized knowledge.

Military developments in the first half of the fourth century also created circumstances favorable to the production of specialist instructional handbooks that formulated general principles and offered specific recommendations. In the period of endemic warfare following the Peloponnesian War (431-404), increasing tactical specialization and complexity and technological innovations in siegecraft demanded greater technical expertise and accelerated the professionalization of military personnel, including widespread use of mercenaries.

Against this background, Xenophon wrote a series of monographs on technical subjects and played a pioneering role in defining new fields of enquiry that he considered appropriate to a properly educated gentleman. Written in the 360s–350s, his *Hipparchicus* (*Cavalry Commander*), which discusses the training, organization, and operations of Athenian cavalry, and *Peri Hippikes* (*On Horsemanship*), on strictly equestrian matters, are the earliest surviving examples of theoretical studies relating to war. In both works the topic is narrow and the tone personal but informed, reminiscent of a didactic essay or literary memoir. Different in scope and character was the work written by Aeneas Tacticus around 350. This multivolume compendium seemingly aimed to provide a comprehensive treatment of contemporary military science, including defensive preparations, logistics, finance, stratagems, campaign procedures, and tactics. Only one book survives, conventionally entitled *Poliorketika* (*Siegecraft*), which explains how a city might survive a siege. More impersonal in tone and less literary in style, Aeneas appears to combine firsthand experience of command with an understanding of recent military developments. In both form and content Aeneas' work represents a highly developed professional literature, but the extent of his innovation or debt to earlier, now lost, textual sources remains unknown.

Military authors proliferated in the Hellenistic Period, but virtually nothing survives of their works. Cineas of Thessaly, the minister of Pyrrhus, prepared an epitome of Aeneas' writings. Pyrrhus himself wrote a *taktika*,

as did his son, Alexander II of Epirus. The historian Polybius composed a military manual, which included discussion of tactics and encampments. The Athenian statesman Demetrius of Phalerum is also credited with writing a two-book *strategika*. Other authors are little more than names: Clearchus, Pausanias, and Euangelus, apparently in the third century, and Eupolemus and Iphicrates in the second century. The date of Bryon is unknown. Roman authors later categorized these works as either introductions or specialist treatises. Their content, purpose, and influence are uncertain, though the interest of kings, generals, and statesmen, as both authors and readers, implies that at least some examples of this broad genre were deemed of practical value.

Extant Hellenistic military treatises may be subdivided into two main branches. First, a poliorcetic tradition encompasses texts concerned with siegecraft, machinery, and artillery. At a disputed date in the late third or early second century, Biton wrote a short treatise on siege engines, dedicated to a king of Pergamum. It contains technical specifications and diagrams for constructing six devices built by named engineers in the past. Biton's treatise is the most important source on tension-powered artillery, but it remains unclear why he recommends antiquated devices that had long been superseded by torsion-powered technology. Around 200, Philo of Byzantium, known as Philo Mechanicus, wrote a large compendium on mechanics and civil and military engineering, entitled *Mechanike syntaxis*. Most of this work is lost, but the surviving military sections comprise the *Belopoiika*, on the construction of torsion-powered catapults, *Paraskeuastika*, on fortifications and defensive strategies, and *Poliorketika*, which prescribes equipment and tactics employed by besieger and besieged. Philo's written sources included the surviving poliorcetic section of Aeneas' work and possibly now-lost writings on ballistics by the renowned Alexandrian inventor Ctesibius (ca. 270–230). Later treatises written under Roman rule also provide indirect testimony to lost Hellenistic works: Athenaeus (Mechanicus), probably writing in the 20s, cites numerous ancient authorities, while Hero of Alexandria, writing in the 60s CE, possibly also had access to works by Ctesibius.

Second, a late Hellenistic tactical tradition aimed to explain the terminology, organization and maneuvers of a hypothetical army, based on a highly idealized infantry phalanx, with supporting light infantry and cavalry. Chariots and elephants are also briefly discussed, but declared

obsolete. Insofar as this sub-genre portrays an actual army, it is probably the Seleucid army of the late second century. This tradition originates in a lost treatise by the Stoic philosopher Poseidonius of Apamea (ca. 135–ca. 51). Its form and content are known only through derivative works. The earliest witness is a short tract by Asclepiodotus, commonly identified as a pupil of Poseidonius, which is assumed to be an abridgement of the original work. Later treatises by Aelian (writing 106–113 CE) and Arrian (136/7 CE) derive independently from the same tradition.

The subsequent history of Greek tactical writing during the Roman Empire involved further differentiation of literary forms, notably Onesander's *Strategikos* (49–57/8 CE), a practical and ethical guidebook for readers who aspired to high command, and Polyaeus' *Strategika* or *Strategemata* (161–163 CE), a collection of historical excerpts illustrating stratagems and maxims of commanders of the past. Classical and Hellenistic treatises later became important models for Byzantine military literature.

Trierarch

A trierarch (*trierarchos*) was responsible for fitting out a trireme for service,

including assembling the equipment and recruiting the crew. In Athens it was the duty of wealthy citizens to undertake a trierarchy on a regular basis, a duty lasting one year. From the late fifth century, as the Second Peloponnesian War drained Athens' finances, the duty of acting as trierarch was often split between two citizens to lessen the burden.

A trireme at sea was nominally under the command of the trierarch, but it is likely that those trierarchs with little or no experience deferred to the ship's more experienced executive officer, the *kybernetes* ("pilot").

Triphylia

Triphylia (three tribes) was the name of a state established between the Alpheius and Neda rivers ca. 400. The district that it occupied was often claimed by Elis. Triphylia seems to have included the six "Minyan" foundations, the most significant of which was Lepreum. According to Strabo (8.33.3), during Archaic times the Eleians dominated the territory between the Alpheius and the Neda. By the fifth century, however, we hear of the Eleians ravaging most of the Minyan cities, and 200 Lepreans (but no Eleians) joined the Greek army at Plataea in 479. At some time before 421, apparently as the price of Eleian assistance in a conflict with certain Arcadians, the Lepreans had become subject allies of Elis, but in that year (with Spartan support) they successfully revolted.

Although the Eleians temporarily recovered Lepreum, after their defeat at the hands of the Spartans in the Eleian War ca. 400 it became part of the new state of Triphylia, and Triphylian troops fought as a separate contingent among the Spartan allies in the Corinthian War. Soon after 370, however, Triphylia was incorporated into the Arcadian League, and a hero called Triphylos was proclaimed the mythical son of Arcas, the Arcadian

eponymous hero. Triphylia was regained by the Eleians in 245, but in 217, after the invasions of Philip V, came under Macedonian influence. In 146 the Romans returned it to Elis, which then became part of the province of Macedonia.

Trireme (*Trieres*)

The trireme was the primary warship used from the sixth to fourth centuries in the Greek world. It takes its name from “three,” but whether this indicates three distinct levels of rowers has been debated. It was fitted with sails but was rowed into battle (see illustration in Ships, War entry).

The trireme was a fast and sleek vessel equipped with a large metal ram designed for ramming attacks, although boarding tactics were used, especially by less well trained crews or in confined waters (see illustration in Naval Warfare entry).

Troad

The Troad is the name given to territory south of the Hellespont, near modern Hissarlik, where ancient Troy (or Ilion) is believed to have been situated. The excavations of Heinrich Schliemann from 1870 to 1890 and his successors confirmed that Hissarlik was a major Bronze Age site, occupied over a long period, as seen in the table.

Most historians identify the Trojans as a people subject to the Hittites; whether there was a “Trojan War” is still hotly debated. But for the Greeks and Romans the war was very real. The supposed site of Troy and nearby burial mounds which were identified as those of Achilles and other heroes became tourist attractions. Prominent individuals who came to pay their respects included Xerxes, Alexander the Great, Julius Caesar, and the emperors Augustus and Hadrian. In the fourth century CE, Constantine considered setting up the new capital of the empire at Troy, before settling for Byzantium.

Hissarlik (Troy) Occupation Sequence

Besides the Bronze Age site at Hissarlik, there were a number of significant Greek cities in the Troad. At the northern end, Abydus faced Sestos across the narrowest point of the Hellespont. This was where Xerxes and Alexander crossed with their armies, and it always remained an important route for travelers between Asia and Europe. On the southern side of the entrance to the Hellespont, Sigeum was in a strategically important position, and was one of Athens’ early conquests in the area in

the late sixth century, before the whole area came under Persian control. The other major towns were Assos in the south, where fine fortifications survive today, and the late-fourth century foundation, Alexandria Troas, on the west coast. In the fifth century the cities of the Troad were part of the Delian League, but reverted to Persian rule in the fourth century. After Alexander, the area successively came under Antigonos I Monophthalmus, Lysimachus, the Seleucids, and Pergamum, before finally being handed over to the Romans.

Troezen Decree

The Troezen or Themistocles Decree is an inscribed document (Document 6) purporting to be a decree of the Athenian assembly, on the motion of Themistocles, for defensive measures in 480 during the Second Persian War. The decree directs the evacuation of the women and children to Troezen, the old men and moveable possessions to Salamis and for the able-bodied citizens to man 200 triremes. Half of these are to sail to the Greek defensive line at Artemisium/Thermopylae and half to wait at Salamis. The importance of this decree is that it indicates that the Athenians were contemplating a defense at Salamis earlier than Herodotus' account seems to suggest (although the two accounts are not irreconcilable). However, the decree is controversial as the lettering and other features indicate a third-, not a fifth-century date. On balance it seems likely that the decree is a later, and edited, copy of the original or an amalgam of several decrees and reflects, at least in essence, the original decisions in 480.

Trojan War, Causes

The Trojan War was the most important war in Greek mythology. It provides the background for Homer's two great epic poems, the *Iliad* and *Odyssey*, and for other poems in the epic cycle (only partially extant). Later Greek authors, such as the Athenian tragedians, constantly reworked stories from the war.

The story begins when the Trojan prince, Paris (or Alexandros), who because of an omen has been abandoned on Mount Ida and brought up by shepherds, judges a beauty contest between three goddesses, Hera, Athena, and Aphrodite. He chooses Aphrodite, who has promised him the most beautiful of women, Helen, the wife of the Spartan king Menelaus. Paris goes to Sparta and either abducts or seduces Helen before returning with her to Troy, which is a rich and splendid city on the Asian side of the entrance to the Dardanelles. Due to earlier promises, leaders from all over Greece join an expedition led by Menelaus' brother, Agamemnon, king of Mycenae, to recover Helen.

Trojan War, Course

Agamemnon gathers a mighty force of 1,184 ships, perhaps over 100,000 men, described in detail in *Iliad* 2, and discussed somewhat disparagingly by Thucydides. The fleet gathers at Aulis in Boeotia, but is becalmed: Agamemnon has to sacrifice his daughter Iphigeneia to Artemis to get the winds to blow. When the expedition arrives at Troy, the first man to die is Protesilaus, later worshipped as a hero at Elaious on the Chersonese. For 10 years, the Greeks besiege Troy, but are unable to capture it. Homer's Trojans speak Greek, but have many non-Greek-speaking allies from Asia Minor and Thrace. The war is a stalemate, though the Greeks capture and sack many small towns in the area around Troy.

The events of the *Iliad* take place in a short period in the last year of the war, when the Greeks are wearying of the whole enterprise. The greatest Greek warrior, Achilles, whose mother is a sea-nymph, quarrels over booty with Agamemnon, and withdraws from the fight. Although the Greeks have other great warriors, such as Ajax, Diomedes, and the crafty Odysseus, without Achilles they cannot match the Trojans under their great leader Hector, son of King Priam. The *Iliad* describes a series of battles on the plain between the walls of Troy and the sea shore where the Greek ships are beached. While Achilles sulks, his best friend Patroclus borrows his armor, but is killed by Hector. Grief-stricken, Achilles rejoins the fray, and kills Hector, though he knows from the gods that this seals his own fate. He dishonors the corpse and refuses it burial, until eventually he relents and ransoms the body back to Priam.

An early-fifth-century *amphora* with a scene probably representing two unnamed soldiers fighting in the Trojan War. The soldiers are equipped as hoplites, although the one on the left carries the earlier Dipylon shield, long replaced by the *hoplon*, the round shield that gave the hoplite his name. This is probably intended to give an archaic flavor to the scene. Located in the J. Paul Getty Museum, Malibu, California. (The J. Paul Getty Trust)

After the conclusion of the *Iliad*, but told in flashback in the *Odyssey*, Achilles is killed by an arrow shot by Paris. But eventually the Greeks capture Troy with a ruse: on Odysseus' suggestion, they pretend to depart, but leave behind a giant wooden horse, which has warriors concealed inside. The Trojans in relief take the horse into the city as an offering to the gods, but at night, while the Trojans sleep off their celebrations, the Greeks exit from the horse and open the gates to the other Greeks, who have now returned. They sack the city brutally, killing Priam and many others, and lead the women into slavery.

Trojan War, Consequences

Despite attempts to find vestiges of the story in Hittite records, the war should be regarded as a complete fiction. The Greeks believed that it heralded a troubled period, symbolized by the difficulties several of the heroes have returning home, and by the subsequent murder of Agamemnon by his wife and their son's later revenge. But, whatever the origins of the story (and it was possibly inspired by the visible but inexplicable remains of Bronze Age citadels at Troy and at various places in Greece—see illustrations in Mycenae and Tiryns entries), it provided a rich ground for Greek story-telling, sometimes with added contemporary relevance. Many have, for example, seen Euripides' *Trojan Women* (415), ostensibly about the women waiting to go into slavery after the sack of Troy, as commentary on the recent Athenian destruction of Melos. The Romans believed that fugitive Trojans had settled in Italy: hence Vergil's great national epic, the *Aeneid*, has a vivid description of the sack of Troy as Aeneas, whom Julius Caesar regarded as his ancestor, escapes the burning city. More recently, Jonathan Shay has used Homer's depiction of Achilles as a way of exploring modern ideas about PTSD.

Trophy (*Tropaion*)

A *tropaion* (pl. *tropaia*; trophy) was a formal dedication arranged by the victor, in part to celebrate the victory itself, but also as a means of offering thanks to the gods who had allowed it. The common form was a set of captured arms erected as a display on the battlefield, but spoils could also be relocated to be dedicated in temples and sanctuaries. For example, the Boeotians erected a trophy outside the nearby temple of Athena Itonia, when they defeated Athenians under Tolmides at Coronea in 447.

Tropaia appear very early on. Isocrates goes so far as to claim that the first time Greeks erected a battlefield trophy against a barbarian foe was when Agamemnon sacked Troy. By the Classical Period, the erection of trophies had become a standard procedure. Thucydides alone mentions at least 43 different battlefield trophies. Usually, they were sets of captured arms erected at the point most associated with the victory. But to mark special victories, the dedications could be more elaborate. For example, in 413, to celebrate the riverside annihilation of the large Athenian expedition sent against them, the Syracusans, according to Plutarch (*Nicias* 27.6), “decorated the tallest and finest trees by the riverside with the Athenians’ arms.”

At *temene* (sacred precincts) throughout the Greek world, visitors could view dedicated arms and sculptures displayed as war trophies. The second century CE traveler and antiquarian, Pausanias, mentions 19 *tropaia* that had

survived to his time. One of the most interesting dedications was made by the people of Tegea in their temple of Athene Alea. To celebrate their victory over Sparta, they erected the very fetters that the hubristic Spartans had brought with them to enslave the Tegeates.

The Thebans were criticized for setting up a permanent *tropaion* at Leuctra in 371, but in the Hellenistic Period, *tropaia* could often take a more permanent form, similar to today's war memorials. Representations of *tropaia* also appear in art and could become an important means to establish the public profile of a king or general. The erection of long-lasting *tropaia* was also important, since they could be used as testimony of a poorly remembered event. Demosthenes uses a trophy set up by the Phocians to celebrate the slaughter of 270 Thebans at Hedyleum as solid proof of the victory to make a political point.

Captured arms and booty could also be displayed in the treasuries that some cities built at panhellenic centers, such as Delphi and Olympia. Some treasuries could even be said to have doubled as memorials to particularly important conflicts: an example is the Theban treasury at Delphi, which was built with the spoils of their famous victory over Sparta at Leuctra in 371. The Greeks could also take great trouble to celebrate significant victories with very specific war monuments. A famous example is the bronze Serpent Column. Originally supporting a gold tripod, erected at Delphi to celebrate the Greek victory over the Persians at Plataea, it was relocated from Delphi to Constantinople in 324 CE, and can still be seen in the Hippodrome in Istanbul.

Truces

Kerykes (heralds) were responsible for negotiating truces. Generally, they were able to travel safely in most conflicts and were dispatched by opposing states to open negotiations and arrange an exchange of ambassadors. The herald was inviolable. The word itself, in the Greeks' view, was derived from *Keryx*, the son of the messenger god, *Hermes*.

The most common truces of the battlefield were called to allow negotiations between the parties (for example, *Nicias* at *Syracuse*) or were sought by the defeated army to bury its dead. It may be argued that truces to bury the dead were so readily agreed because they were, in effect, a clear acknowledgement of defeat by the side which no longer controlled the battlefield. If there were no truce, the army would have to win back the battlefield and its fallen men. If a truce were agreed, the victors could set up a trophy and the defeated side could extract and honor its dead. While truces to bury the dead were often agreed, sometimes a side would feel so aggrieved by their enemy's actions that cessation of hostilities was not possible. The Athenian occupation of a sanctuary at *Delium* during the *Peloponnesian War* angered the *Boeotians* so much that they refused to agree to a truce to allow the Athenians to remove their dead. Truces could also exist which protected passage to and from panhellenic festivals. For pilgrims and athletes to travel across Greece in times of war, *ekecheiriai* (sacred truces) would be announced by *spondophoroi* (sacred heralds).

Ancient commentators were shocked when a truce was contravened or a herald violated. The most famous example was the maltreatment of *Darius'* heralds in 490. *Herodotus* described it as an impious crime, even when the victim represented the barbarian aggressor, who himself had desecrated the most sacred of Hellenic sites. He describes the inviolability of the *keryx* as

one of the “natural laws of humanity” and explained how the Spartans’ abuse of Persian envoys had, in turn, invoked the wrath of Talthybius, the Spartan herald-hero, and how they were to pay for their crime a generation later through the death of the sons of the Spartan ambassadors, Sperchias and Butis (Herodotus 7.133–137). Other legendary and historical examples include the murder of Minos’ ambassador, Androgeus; the death of the Athenian herald, Anthemocritus, allegedly perpetrated by the Megarians; the incarceration of Agesilaus’ heralds, Xenocles and Scythes; and the stoning of the ambassadors of Cerasus by the Ten Thousand.

Surrender could be brokered through a formal truce in which conditions were agreed, particularly in relation to outcomes for the vanquished. Without terms, the army and its state could be executed or enslaved with impunity. There were also long-term truces, which acted as ceasefires at times when sides were exhausted or the political situation compelled a cessation without resolution. For example, Athens and Sparta agreed to a five-year truce in 451 and a one-year truce in 423.

Tryphon/Diodotus (Reigned 142–139)

Diodotus, a Seleucid officer, led the troops from the military depot at

Apamea to end a reign of terror in Antioch by the Cretan mercenaries employed by Demetrius II Nicator. He then set on the throne Antiochus (VI), an infant son of Alexander Balas, but soon disposed of him and took the crown himself under the name of Tryphon (142).

Tryphon (the name means “Magnificent”) controlled only Antioch and its hinterland in the Orontes valley. To prop up his rule against Demetrius II, who controlled the southern and eastern parts of the empire, Tryphon made large concessions in Palestine to the Maccabean leaders Jonathan and Simon. However, his treacherous seizure and murder of Jonathan only inflamed Maccabean expansion.

Tryphon abandoned the Seleucid dating era on his coinage, which bore his novel title of *Basileus Autokrator* (“Supreme King”). He thus aimed at establishing a new dynasty, but he lacked legitimacy and was easily overthrown in 139 by Demetrius II’s younger brother, Antiochus VII Sidetes. He committed suicide in defeat.

Tyrants, Tyranny

When not simply a synonym for *basileus* (king), in the Archaic Period the word *tyrannos* (tyrant) seems to indicate how a ruler came to power, not the nature of the regime—the negative connotations of “tyrant” only developed later. Originally, when the hereditary systems of monarchy or aristocracy were the norm, a tyrant was a man who attained rule without inheriting it. In this period, tyranny almost seems to have had overtones of merit-based selection—a man chosen for the job rather than inheriting it from his father. However, the negative overtones also began fairly early—a feature of several accounts of the early tyrants was that the second generation was less

talented than the first. Examples include the Cypselids of Corinth and Peisistratids of Athens. In later periods, when forms of government other than monarchy or aristocracy were the norm, a tyrant was someone who came to power outside the normal political processes.

Tyrants existed in all periods of Greek history from the seventh century onward. However, the widespread phenomenon of tyranny in the period from the rise of Pheidon of Argos (ca. 675) to the end of the Peisistratids in Athens (510) sometimes led to it being called the “Age of Tyrants.” However, as Pheidon seems to have been a king who wrested his powers back from the aristocracy, the start date of the “Age of Tyrants” is frequently taken as Cypselus of Corinth, ca. 650. Although specific factors were also important in each case, because of the proliferation of tyrannies in this period, historians have identified several underlying causes for it.

The main ones are linked: the breakdown of aristocratic rule and the introduction of hoplite warfare. Hesiod, one of the earliest extant Greek poets (writing ca. 700), presents a view of oppressive and corrupt aristocratic rule. This certainly seems to have been a factor in the rise of Cypselus—often regarded as the archetypal or first “true” tyrant—in Corinth. Here, rule was restricted to one family, the Bacchiadae. The Bacchiads were exclusive, autocratic, and Corinth’s power and prosperity—their main justification for rule—was slipping. The brutality of the aristocratic regime of the Pentilidae at Mytilene was also a factor in their overthrow, and the continual faction fighting between aristocratic clans at Athens created the conditions for Peisistratus’ tyranny there.

The circumstances of Cypselus’ coup are uncertain—there may also have been a military element, but there is no real evidence of Cypselus’ military career, only of his popularity as a magistrate. His tyranny followed (or perhaps established) the traditional pattern of a popular tyrant (although Herodotus’ account is hostile), followed by an oppressive and hated son whose tyranny (or his successor’s) was overthrown.

Pheidon of Argos came to (or restored) power on the back of military success. This was an important factor in itself for gaining popularity. However, the introduction of hoplite warfare gave added impetus to this—it broke down the aristocratic monopoly of warfare and meant a commander who gained popularity with his troops also gained much broader direct community support than before. At the same time, the spread of military service further into a community helped increase expectations for more say

in how it was run. Most assemblies, even if rudimentary, consisted of men of military age and as their service as a hoplite was much more important to the state it seems natural that they would over time want more recognition for this. Other examples of tyrants whose military prowess helped them become tyrants include Orthagoras at Sicyon, Peisistratus at Athens, and Agathocles, Gelon, and Hieron II at Syracuse.

Other factors that played a role in the early tyrannies were tensions between Dorian and non-Dorian elements of cities. This was a factor in the tyranny of Cleisthenes of Sicyon (ca. 600–560), who is reputed to have renamed the Dorian tribes at Sicyon with insulting terms. Other examples include Pantaleon at Elis (if he is a real figure) and there may have been a small racial aspect to Cypselus' tyranny—the Bacchiads were Dorian—although he probably also had support from both Dorian and non-Dorian elements.

After the so-called Age of Tyrants, tyrannies were not so prominent, but continued as a feature of Greek political life. For example, a series of tyrannies occurred in Syracuse (and other states in Sicily/southern Italy) in both the fifth and fourth centuries and Eretria in the first half of the fourth century. Tyranny was also a feature of the Peloponnese in the third century and beyond. In 251, for example, Aratus expelled the tyrant Nicocles from Sicyon, and in 235 (unusually) Lydiadas, who had been tyrant of Megalopolis since ca. 243, abdicated. Even Sparta had a tyrant, Machanidas, at the end of the third century.

In general then, tyrannies rose during periods of conflict, whether internal—between aristocratic (or other factions) or between classes or different racial elements—external, or both combined. Their main feature was the decision by enough people, or enough influential people, in a state that one man could do a better job of dealing with a conflict, whether it was racial, class-based, economic, or military in origin. Tyrants could also be imposed externally. This was a feature of Persian rule over Greek Asia Minor and of Macedonian-dominated Greece post Alexander.

However they came to power, though, most tyrants were concerned with their personal safety—tyrannicides were often regarded as heroes and Athenians, for example, had a legal requirement to oppose tyrants. Tyrants maintained their rule through a mixture of popular measures (often including major public works—Polycrates of Samos and Peisistratus of Athens are good examples), and close attention to their personal security.

Tyrants were generally heavy employers of mercenaries, most (Cypselus of Corinth is an exception) had bodyguards and often relatively sophisticated internal security measures. They also occasionally sometimes used alliances with each other to increase security (Peisistratus and Lygdamis of Naxos provide a good example of this).

Tyre, Siege of (332)

Alexander the Great captured Tyre, the most important port in Phoenicia, after a bitter seven-month siege. Although the other Phoenician cities surrendered to Alexander after Issus, Tyre did not. The main city, on an island about half a mile (0.8 kilometers) offshore, had strong walls and a good fleet. Alexander's first action was building a mole or causeway out to the city from the mainland. However, this was constantly disrupted by Tyrian naval attacks until Alexander gained naval superiority with the arrival of 200 ships from Cyprus, Byblos, and Sidon, and 24 from elsewhere. The siege engines on the mole had limited effect because of the height and width of the walls, and Alexander began using siege engines on ships

against various parts of the wall. The first breach was made on the south side, but the city ultimately fell to multiple attacks from several directions. The fighting was brutal with 8,000 defenders killed. Alexander made an example of the city to encourage others to surrender—30,000 of the captives were sold as slaves. The fall of Tyre effectively ended Persian naval resistance.

Tyrtaeus (ca. 680–ca. 620)

Tyrtaeus was a poet in Sparta at the same time as the Second Messenian War (traditionally ca. 650–630). His poems, collected in antiquity in five books, related to two major crises in seventh-century Spartan history.

The first was serious discontent among the citizen body over the rule of the kings and elders (*gerousia*) either before or during the Second Messenian War, leading, it is said, to a demand for land redistribution. Tyrtaeus urged obedience to the divinely-ordained constitution of Sparta. His poem or poems on this were referred to by the title *Eunomia* (“Good Order”), a term often applied to Sparta’s constitution or those resembling it.

The second crisis came from Sparta’s setbacks in the Second Messenian War. Tyrtaeus’ war poems urged Spartans to fight with the utmost courage. Stories clustered in antiquity about this episode. Tyrtaeus was said to be a lame, one-eyed schoolmaster, sent by Athens in derision when, in obedience to an oracle, Sparta requested a leader to make up for past defeats. He rose

splendidly to the occasion. Such stories, including those making him commander in the war, were inventions, based on loose inferences from his actual poems.

The elegiac meter, in which Tyrtaeus wrote, was an accepted vehicle at this time for serious exhortations to fellow-citizens and was so used, for example, by Callinus and Solon. About 250 lines of Tyrtaeus' elegiac poetry survive, giving some indication of his political and moral messages. In his war poems, Tyrtaeus calls upon soldiers to fight bravely, indifferent to death or mutilation. These poems are saturated with language and images drawn from Homeric epic. They are not straightforward evidence for the details of warfare of the time, but it seems reasonable to see in them a call for the kind of self-sacrifice and cohesion demanded by the new style of hoplite fighting in a phalanx.

Vergina

Vergina is a small village in northern Greece, on the northern slopes of the Pierian mountains. Its ancient name was Aegeae, and it was the old capital of the Macedonian kingdom. With fertile land and a strategic position, it was occupied by Illyrians, Thracians, and Paeonians from the early Iron Age.

Traditionally around 650, the Macedonian Argead dynasty took control of the area, under the leadership of Perdiccas I. For one and a half centuries Aegeae was the capital of the Macedonian kingdom, until in the late fifth century, Archelaus I moved the capital to Pella nearer the sea. Aegeae remained an important sacred site and continued to be the place where Macedonian kings were buried. In 1978, the Greek archaeologist Manolis Andronikos made one of the most significant archaeological discoveries of the twentieth century, a set of four royal tombs in the Great Tumulus of Vergina. One of them is generally thought to be the tomb of Philip II of Macedon. Archaeologists have also excavated palaces, sanctuaries, a theater, and an *agora* at the site.

War Crimes

A number of acts committed in war were considered to be shameful in the eyes of gods and men. Perhaps the most extreme was human sacrifice. The Mycenaeans may have condoned the practice, as suggested by its survival in the epic tradition (e.g., Iphigenia at Aulis and the 12 Trojan youths sacrificed by Achilles at Patroclus' mound), but it was certainly not accepted in the Classical Period and was considered a grave instance of *asebeia* (impiety). Plutarch (*Pelopidas* 21) describes Scedasus' suggestion that a red-haired virgin be sacrificed on the eve of Leuctra as "unlawful and barbaric." The only apparent instance concerning the fifth century is the account recorded by Phanias of Lesbos (fragment 25), in which Themistocles is said to have succumbed to army pressure and the advice of the seer, Euphrantides, and sacrificed three noble Persian captives on the eve of Salamis, in honor of Dionysus Omestios. However, the account is generally considered late and unreliable.

Offences against sacred precincts were universally condemned. In particular, *hierosylia* (temple-robbing) was regarded as heinous. Herodotus claims that an entire tribe of Scythians was punished with a genetic disease for this crime. Elsewhere he approves of the punishment of the impious Artaÿctes, who, among other outrages, stole the sacred funds of Protesilaus at Elaeus. Pausanias catalogues the attempts by Crius, the Phlegyans, Pyrrhus, Xerxes, the Phocians, the Gauls, and Nero to plunder the richest sanctuary of them all: Delphi. Worse than *hierosylia* was the deliberate destruction of the *temenos* (sacred precinct) itself. Again, it is Pausanias who lists instances, including Cleomenes I's destruction of a sacred grove in Argos, in which suppliants had sought refuge, and the destruction of

Apollo's sanctuary by the Boeotian, Caanthus. But the most notorious example was the Persians' systematic destruction of Greek sanctuaries in 480–479. Aeschylus, in *Persians*, regards a good proportion of Xerxes' humiliation as direct requital for these crimes of war. However, Herodotus claims that the Persians had cited the burning in 498 of the temple of Cybele in Sardis during the Ionian Revolt as a pretext.

Similar to this class of war crime was the abuse of priests, who, it could be argued, were the "property" of the gods. In the *Iliad*, for example, Apollo sends a plague to punish the Achaeans for their maltreatment of his priest, Chryses. The abuse of suppliants, envoys, and heralds was also abhorred. Retribution was often called "the vengeance of Neoptolemus," after Achilles' son who, for having killed Priam during the sack of Troy at an altar, was killed himself at Apollo's altar in Delphi (Pausanias 4.17.4). In Xenophon, we see contrasted Agesilaus' pious regard for suppliants with Critias' impious seizure of Theramenes at an altar (Document 13). Thucydides in his famous denunciation of the excesses of the Corcyraean civil war (Document 9), notes that there was scant regard in this bitter conflict for the rights of suppliants.

Greeks were also obliged to respect their guests and friends, even in war. The Spartan king, Archidamus II, left the estates of his guest-friend, Pericles, unravaged when he invaded Attica early in the Peloponnesian War. This prompted Pericles to hand over his properties to the state, so that he could not be accused of being the only Athenian whose assets were left unharmed. Even without formal friendships existing between two parties, Greeks still expected the rights of the guest to be honored by the host, as if a subtle supplication was in operation through the extension of hospitality. Hence, Isocrates and Xenophon described the massacre of the captains of the Ten Thousand by Tissaphernes, under a truce, as a terrible crime.

Observance of the rights of the dead on the battlefield remained a strong religious consideration throughout the Archaic and Classical Periods. In Book 24 of the *Iliad*, the mutilation of Hector's corpse by Achilles is denounced. Achilles ties Hector's body to a chariot and drags it shamefully around the walls of Troy. Such was their concern that the gods Apollo and Artemis personally intervened to repair the damage to Hector's body. Herodotus describes Cambyses' mutilation of Amasis' corpse as "unholy" (3.16) and condemns the mutilations of Cyrus and Leonidas. Both Herodotus and Pausanias record, in similar language, the revulsion of the Spartan king,

Pausanias at the suggestion that Mardonius' head be cut off and impaled on a spike. The most extreme abuse of the corpse on the battlefield, it could be argued, is the act of cannibalism. A mid-fifth-century bell-crater by the Eupolis Painter captures the moment after Tydeus has begun to gnaw the severed head of his opponent, Melanippus, an atrocity for which he is immediately punished by the gods.

The observance of burial rights even included those of enemies slain in battle. In Sophocles' *Antigone* the priest, Teiresias, explains the consequences for the state of leaving even the corpse of its enemy, Polyneices, unburied. He warns that the altars and hearths will become religiously polluted by human carrion spread by birds and dogs. Pausanias condemns the impiety of Lysander in not burying the dead of Aegospotami and contrasts it with the Athenian respect for the Persian dead at Marathon.

Women in War

Greek women did not normally take any part in combat. Xenophon tells us

that they were believed to have been physically unsuited by nature for any such rigorous outdoor activity (*Oeconomicus/ The Householder* 7.21–5).

The Greeks could nevertheless imagine a race of foreign women warriors, the Amazons, who fought against Greek heroes. Such a role for women in mythological stories was an inversion of the expectation Greek society had of its own women. Weapons found among the grave goods of female Sauromatians, a nomadic people who lived on the Eurasian Steppes from the Early Iron Age, may have provided a historical point of focus for the Greek stories.

Historical examples of Greek women in combat roles are few and generally have a legendary or apocryphal element to them, such as the story of the women of Argos led by a female poet, Telesilla, driving off a Spartan attack in about 494 (Plutarch, *Bravery of Women* 4 [*Moralia* 245]). We do, however, hear of women in extreme circumstances such as the storming of their city, defending themselves by whatever means they could, such as throwing roof tiles and stones from their houses. Examples of this include when the Thebans broke into Plataea in 431, during civil unrest in Corcyra in 427, or the death of Pyrrhus in 272. In emergencies, women might take other roles in defense of their city, such as helping build or repair city walls, cutting their hair to make ropes for artillery, dressing in armor to deceive the enemy about the number of fighting men (Aeneas Tacticus 40.4–5), or cooking food for the city's garrison.

Queen Artemisia of Halicarnassus is an exceptional case: we are told she took on a combat role. Herodotus tells us (4.99) that she commanded five ships sent by the Greek cities under her rule to fight against the Greeks at the battle of Salamis (480). He notes just how extraordinary it was for a woman to hold a military command, how the Athenians had felt it was disgraceful for a woman to wage war on them, and how they had put up a prize of 10,000 drachmas for her capture (8.87–88).

Women were not expected to fight but they could be used as inspirational role models for the men who did—such as the Boeotian virgins before Leuctra (Document 16). There were other legendary stories of heroines such as the daughters of Leos, Hyacinthus (Diodorus 17.15) and of Erechtheus and Praxithea who were sacrificed or killed themselves to save their city (Lycurgus, *Against Leocrates* 98–100).

Women were depicted as upholding the military ethos of a state, transferring cultural values to their children in telling their sons to fight

courageously. Plutarch represents Spartan mothers as urging their sons to win honor by fighting bravely and, when necessary, dying for their city (*Sayings of Spartan Women*). We are told that in 479 the women of Athens stoned the family of a man who had proposed that the Athenians make peace with the Persian king (Herodotus 9.5). In a celebrated Greek comedy, Aristophanes' *Lysistrata*, however, women were depicted as advocates of peace and critical of war and the conduct of war by men.

When a city fell, the victors would normally enslave the women and children, treating them as spoils of war. The massacre of women was rare, though it is reported to have occurred at Mycalessus in 413 (Thucydides 7.29), and Selinus in 409 (Diodorus 13.57). Legendary campaigns for the purpose of seizing women to populate their new cities by the Ionians, Pelasgians, and Romans may be apocryphal. Such stories suggest a more positive outcome for the female inhabitants of a defeated city-state: marriage rather than slavery. Historical examples of the enslavement of the female population of a city are many: Scione in 421 and Melos in the winter of 416/5 are two examples. The lot of such women is taken up in Greek literature as early as the *Iliad* (end of the eighth century) where the plot turns on arguments over the possession of two women taken as prizes of war, Chryseis and Briseis. The suffering of captured women was a theme common in tragedies of the fifth century, most prominently by Euripides. Death, rather than slavery, was the noble choice. The distasteful subject of the rape of captured women was not normally addressed by ancient writers. Herodotus' account (8.33) of the deaths of women in Phocis in 480 after being raped multiple times is an exception. Diodorus (13.57) speaks of the terrible indignities suffered by captured women after the fall of Selinus in 409; Phylarchus, a historian of the third century, was criticized by Polybius (2.56, 58–61) for his graphic scenes of the suffering of captured women. Demosthenes tells the story (19, [*On the False Embassy*] 196–198) of how a woman of Olynthus, who had been captured when her city fell (348), was whipped, mistreated, and forced to behave against her natural modest character and upbringing after being enslaved.

Where possible, women would be evacuated from the countryside into the safety of a walled city. This happened in 431 when Attica was threatened by a Peloponnesian invasion. When a city itself was threatened by a siege attempts might be made to evacuate the women further away: examples include the evacuation of the women and children of Athens to

Troezen, Aegina and Salamis in 480; of Plataea to Athens in 429; and of Sicilian Greeks to Syracuse and Italy in 406.

The chivalrous treatment of women captured in war is reported in a few individual cases. A Greek woman who had been taken from Cos by the Persians was released by the Spartan regent Pausanias after the battle of Plataea in 479 (Herodotus 9.76). Alexander the Great captured the wife (and sister), daughters and mother of the Persian king, Darius III, and the daughter of the previous Persian king: he is remembered for treating these women with great respect but he refused all attempts by Darius to ransom the women and married two of them himself at a ceremony in 324 (Arrian 2.12.3-8, 4.20, 7.4.4-8).

There is evidence that the children of citizens killed in battle would be maintained at the state's expense, but widows were given no public support themselves.

Wounds

The rate of injury in ancient Greek warfare is far from clear, yet wounds

must have been a reasonably common occurrence, simply due to the violent nature of war itself. War wounds were a significant enough area of medicine that there were once sections within the Hippocratic corpus dedicated to it, although they have unfortunately not survived. Wounds received by notable individuals are occasionally mentioned in the ancient literature (notably and vividly in Homer's *Iliad*), but the sources rarely report the number wounded in battles. This does not mean that we should assume that the number was low.

Many wounds will have been fairly minor or cosmetic in nature. These include superficial wounds from slashes and small projectiles, leaving scars but not impeding movement. The results might have been minor breakages and dislocation of bones and joints, as well as loss of extremities (one or two fingers, toes, and so on) that would have been uncomfortable, but in most cases not life threatening. Scars were held as a sign of valor in war, so any change in quality of life may have been balanced by a gain in social reputation. In some cases, while a wound was debilitating for a short time, the effect was not permanent. For example, a soldier with a dislocated knee might not be able to walk, but with the right medical care he could return to duty reasonably quickly. We know that treatments for these wounds did exist because of the recommendations in the Hippocratic corpus.

In the case of broken bones, the recovery time tended to be longer (in the Hippocratic corpus, there is a recommendation to stay off a broken foot for 20 days) and the consequences were more varied.

Broken bones that were incorrectly set could potentially create a limp that was so severe that an individual would have trouble walking and a visible distortion of their gait. This was more probable if the broken bone was the thigh, which doctors appeared to have more trouble setting due to the thicker bone and greater difficulty in splinting the area. This led to a shortened limb and severe loss of mobility, as well as reducing a soldier's ability to carry arms and equipment.

There were risks associated with other wounds that initially appeared minor. Tetanus was a serious risk for small injuries, whether caused by projectiles, edged weapons, or a doctor's tools. In the Hippocratic corpus, we see a comparable case of a shoemaker eventually dying from tetanus after having a small instrument sink a finger's length into his knee. If you avoided infection, the impact of these wounds would be reasonably minimal. It is conceivable that there were many people with such wounds

actively taking part in warfare, due to the relatively small impact such wounds would have had on movement and functioning.

As with minor wounds, significant impact wounds would have created a risk of tetanus and other infections. This risk would probably have been greater due to the larger surface area of bigger wounds, leaving more areas vulnerable to infection. Wounds with a significant risk of death could also be survived, albeit with some physical consequences. This was sometimes despite seemingly small odds of recovery. A wound to the back may impede movement quite significantly and be life threatening, but we do have examples of individuals receiving such blows and surviving (this type of wound was considered to be embarrassing, because of the idea that the wound would have been received while fleeing). We also see people in literature apparently believably surviving stab wounds to the ribs. Similarly, one case describes an individual surviving an arrow to the groin, with the point of the arrow still remaining in place years later.

Amputation could be necessary following an injury to extremities. It is worth noting that this type of injury could include conditions encountered on campaigns causing frostbite, as well as more traditional causes such as damage from weapons (punctures, slashing). Gangrene developing from another wound was also a common event in the ancient world, with gruesome and occasionally fatal consequences. Ancient Greek doctors usually waited for the blackened extremity to fall off on its own account in the case of smaller areas, like fingers or toes. This was probably in an attempt to avoid the consequences of infection, and differs from Roman medical advice which recommended amputation much sooner than the earlier Greek doctors were inclined to undertake the same procedure.

In terms of limb loss and the amputation of severely damaged limbs, while Hellenistic doctors could successfully treat a number of wounds, they appear to have had difficulty in stopping the massive bleeding caused by amputation of a limb. Shock would probably have killed a patient in this situation. This is especially so considering that ancient Greeks lacked modern methods of pain relief. Yet, we do have evidence of patients surviving significant amputations. In Xenophon, we hear of prisoners of war having their right hands amputated in lieu of a death sentence, a procedure which many seem to have survived. Diodorus provides a rather evocative example of what wounds could be survived when he described Alexander's entry into Persepolis, where he met Greek prisoners of war who had been

severely mutilated. Presumably these individuals must have had limited medical attention available for their injuries, yet some continued to survive. The Hippocratic corpus does advise the partial removal of a limb in certain circumstances, suggesting that a physician only remove already blackened and presumably “dead” flesh. There appears to have been some variation in this area regarding what doctors were prepared to do, perhaps because any time a patient died it was considered a blow to a doctor’s reputation, whether or not the doctor was to blame.

There must have been a group of people who did survive deliberate medical amputations, whether or not because the loss of a hand or foot was inherently more survivable than the loss of an entire limb, or simply due to luck and relatively appropriate medical treatment. Certainly, limb loss in battle or otherwise was common enough for Diodorus to consider limb reattachment to be necessary for a utopia. Whether he wants it to avoid death, or simply to allow a better quality of life, is unclear, but it does represent some anxiety around this area in the Greek mind. Loss of an entire limb would have made it nearly impossible to fight as a hoplite.

Needless to say, there were other wounds in ancient Greek warfare that were so devastating that they were generally fatal. On the most extreme side of this are wounds such as abdominal wounds, which were almost always fatal due to the likelihood of infection. In antiquity, it was a question of how long it would take an individual with an abdominal wound to pass away rather than whether they would recover (and it could take up to a month, in some cases). In Homer, it is explicitly stated that this type of wound would surely mean that the injured individual will not survive long. In this area, medical intervention would probably speed up the process of dying, given that physicians were sometimes inclined to cut into the chest in the spirit of attempting to assist. Given the lack of organ transplants, wounds to organs (such as one to the liver) would have been impossible to survive if full function was lost. Head wounds could also be fatal, due in part to their unpredictable nature. Similarly, impact wounds to the chest were often fatal due to the likelihood of infection.

It is also worth considering how injuries may have occurred off the field of battle: a cavalryman being dragged by a horse, a prisoner of war getting infected wounds from fetters, or even run-of-the-mill accidents occurring when the military was on the move or setting up camp. These wounds would have shared the common dangers of life in the ancient world, being

subject to the same risk of infection that could make even small, mundane injuries fatal.

Xanthippus (Athenian) (Active 480s)

Xanthippus was a prominent Athenian who married Agariste, a member of the Alcmaeonid family; one of their children was the great Athenian leader Pericles. Xanthippus came into prominence in 489 when he prosecuted Miltiades after an unsuccessful attack on Paros. In 484 he was ostracized, in a period where the same fate befell a number of the Alcmaeonid family and associates, but with other victims of ostracism he was recalled in 480 to fight the Persians. In 479 he commanded the Athenian contingent at the battle of Mycale, and in the following winter (479/8) captured the vital harbor city of Sestos on the Hellespont. Herodotus tells the story of how he proceeded to crucify the Persian governor, Ataŷctes, for alleged sacrilege against the tomb of Protesilaus at Elaious. Afterward he disappears from history. Despite a lack of evidence, he was clearly one of the most significant Athenian commanders as the Athenians began their fifth-century rise to be Greece's most powerful state; there was a statue of him on the Athenian acropolis.

Xanthippus (Spartan) (Active ca. 255)

Xanthippus was a Spartiate serving with the Greek mercenaries recruited in the winter of 256/55 by Carthage to counter the Roman invasion of North Africa during the first Punic War. With his prestige and war experience, Xanthippus convinced the Carthaginian authorities to fight the Romans on open ground.

Utilizing Carthaginian supremacy in elephants and cavalry, Xanthippus placed his elephants in a line before his infantry and strengthened the cavalry on his wings with his best infantry. In response, Regulus made the mistake of increasing the depth of his infantry, instead of adopting an open formation.

Xanthippus' cavalry and infantry on the wings drove back the Roman cavalry and, as ordered, attacked the Roman infantry in the flank and rear. The elephants drove the Roman infantry into a confused and crowded mass, which lost cohesion under attack on all sides. Only 2,000 out of 15,000 Romans escaped from the battlefield. Regulus was among the 500 prisoners; the rest were killed.

Xanthippus was a military professional who had the good luck of defeating an unsophisticated opponent.

Xenophon (ca. 430–ca. 353)

Born into a wealthy family, Xenophon, having served in the cavalry and associated with Socrates, was ill-at-ease in post-civil war democratic Athens and, accepting a friend's invitation, became a mercenary in Cyrus' army (401). After Cyrus' defeat at Cunaxa the mercenaries returned to Byzantium via Mesopotamia, Armenia, and northern Anatolia. As one of those selected to replace five generals seized and executed by the Persians, Xenophon

played a major role in this achievement. After a winter's employment by the Thracian Seuthes the mercenaries (Xenophon included) entered Spartan service to help secure the freedom of Anatolian Greeks from Persian rule. He became closely involved with senior Spartans, notably King Agesilaus II, and when Agesilaus returned to Greece in 394, found himself fighting against fellow Athenians at Coronea. Now an exile, he was settled at Scillus where he lived the life of a country gentleman, served as Sparta's representative at nearby Olympia, sent his sons for education in Sparta, and spent mercenary booty on erecting a small-scale copy of Artemis' famous temple at Ephesus. Sparta's loss of authority after Leuctra (371) caused his expulsion from Scillus and he reportedly settled in Corinth, though here, as in the claim that his Athenian exile was formally repealed, the biographical tradition's authority has been questioned. But *Cavalry Commander* and *Ways and Means* show sympathetic interest in Athens' well-being and some reconciliation is reflected in his sons' service with the Athenian cavalry at Mantinea (362). There is no actual evidence—even in the biographical tradition—that Xenophon himself ever took part in a battle again after 394.

Xenophon's large output is formally varied—individual items are often the earliest surviving examples of particular literary types—but the subject matter characteristically reflects personal experience. A fundamentally instructional agenda is often expressed through historical material: Xenophon's assumption that the past is a tool for promoting political and ethical improvement is deeply embedded. Both his personal life-story and the general history of his times were filled with conflict, and the management of such conflict called for the leadership skills that are a persistent topic throughout his writings.

Warfare can therefore obtrude almost anywhere. *Hiero* compares a tyrant's apprehensions with those of a soldier on campaign. *Socrates* discusses the Persian king's garrisons, the military requirements for Athens to thwart the Boeotians and recover its former greatness, and the qualities needed by its commanders—among which general principles of leadership, persuasive speaking, and awareness of logistics are as important as tactics and weapon-training. *Cynegeticus* presents hunting as a means of promoting military, intellectual, and moral excellence (something neither sophists nor politicians can match). *On Horsemanship* covers war-horses—mostly equestrian issues (acquisition and care, temperament, bits, deportment) but also armor and weaponry. *Ways and Means* seeks ways of

securing Athens' wealth and influence that are not dependent on unpopular military methods. (The answer is to pay citizens a dole from taxes on foreign residents and profits generated by employing state-owned slaves in the silver-mines, and use championship of peace as a route to international ascendancy.) *Spartan Constitution* explores the peculiarities—and weaknesses—of a state whose citizens are “craftsmen of war,” though only three chapters deal with military technicalities. *Cavalry Commander*, by contrast, entirely focuses on such things: its ultimate aim of improving the Athenian cavalry is characteristically pursued by advising the commander how to deal with recruitment and training of men, care of horses, civic cavalry displays, management of subordinates, and a variety of tactical situations.

But for continuous presentation of war one must go to the three long historical works. *Hellenica* describes the last seven years (410–404) of the Second Peloponnesian War and the long-term results of Spartan victory, ending with Greece in an unabated state of disorder after the indecisive battle of Mantinea (362). It forms a substantial part of the database on Classical Greek *polis* warfare, as it describes several large-scale battles of major historical importance (Arginusae, Aegospotami, Coronea, Nemea, Leuctra, Mantinea) as well as mentioning with differing amounts of detail over 140 other military engagements. Where other source-material is available, Xenophon's versions can seem idiosyncratically selective, but basic inaccuracy is hard to demonstrate, and the narratives of campaigns and individual encounters are not infrequently evocatively vivid. That cannot really be said of *Cyropaedia*. This work asks how Cyrus the Great won and ruled a vast empire: the answer is by intelligent and sympathetic leadership, but the story-line is one of warfare and conquest and embraces military reforms (extension of recruitment to a wider social group, creation of cavalry forces), tactical training and deployment, strategic planning, and various other practical details (e.g., the design of camps or the need for medical provision). But narrative pace and literary texture are unlike those of normal historiography and story-telling is subordinate to the instructional purpose. So analytic presentation consistently wins out over evocative detail, and the casual reader can understandably find the result somewhat dull. Here *Anabasis* is different again. This tells the story of Cyrus' mercenary army, providing a uniquely detailed account of Greeks in violent conflict with alien adversaries (Persians, various east Anatolian

tribes, Bithynians, Thracians), often in difficult terrain—and indeed in political conflict with other Greeks. Before deciding to employ them, the Spartans were wary of what was a dangerous accumulation of rather foot-loose professional soldiers. The limited period covered (some two years) and unvarying focus on a single group make this unlike normal Greek historiography too, but the book is rooted in personal experience and instructional issues (the military skills and personal qualities that ensure survival in an exceptional situation, the ambiguities of panhellenist views about dealing with Persia) never overwhelm the telling of a remarkable story. There are comparatively few battle-narratives, but the insight into the dynamics of an ancient military force is without parallel. The only regret is that it is a military force operating in such unusual circumstances, and that one cannot simply transfer what we learn here to the world of ordinary *polis* armies (even ones with mercenary components) operating in a mainland or Aegean environment.

Xerxes (Reigned 486–465)

Though not Darius I's eldest son, Xerxes was his designated successor and, despite objections from a brother in Bactria, duly became king on Darius' death in November 486. He had to insurrection to confront in Egypt (ongoing since 487) and Babylonia (in 484) and did so successfully: Egypt became "more enslaved than before" (Herodotus 7.7) and there were radical socioeconomic changes in Babylonia. Meanwhile preparations were underway for an invasion of Greece. The enterprise was completely unsuccessful. Co-ordinated land and sea advance did not suit the topography, and Xerxes was too apt to fight on the defenders' terms—a fault not too important at Thermopylae but disastrous at Salamis. The fleet's withdrawal left Mardonius less room for maneuver in 479 and permitted a Greek counter-attack on Anatolia. The consequent defeats at Plataea and Mycale reflected the inherent advantage of Greek hoplites over Persian infantry when numerical superiority and cavalry mobility were neutralized.

The outcome was significant loss of territory in Macedonia, Thrace, and Anatolia and the emergence of an Athenian Empire. A Persian counter-offensive foundered at the Eurymedon (467/6) and Xerxes was assassinated not long afterward. That is scarcely mere coincidence, and it is not unduly Hellenocentric to judge his reign (the first in which expansion completely foundered) something of a failure by his predecessors' standards. The artificially lengthened list of subject peoples and novel symbolic assimilation of political loyalty with worship of the royal patron-deity Ahuramazda in one of Xerxes' inscriptions (XPh) might perhaps be seen against this background.

Z

Zancle/Messana

Zancle was a Sicilian Greek city founded by settlers from Cumae and Chalcis ca. 730–725 and named Zancle because its natural harbor resembled the shape of a sickle or scythe. The city prospered from its commercially strategic location on the Strait of Messina between the northeastern corner of Sicily and Italy.

In the early fifth century the city was occupied by Greek refugees from Miletus and Samos who were assisted by Anaxilas, tyrant of Rhegium, then ruling both Rhegium and Zancle. Anaxilas changed the city's name to Messene (though later coins show the name as Messana) in honor of his native homeland of Messenia in the Peloponnese; the city also received settlers from Messenia. During the Athenian interventions in Sicily in the late fifth century, Messana allied itself with Syracuse.

In 396, the city was sacked by the Carthaginians, but resettled shortly afterward by Dionysius I of Syracuse. The city supported Dion of Syracuse in his overthrow of Dionysius II of Syracuse in 357. During Timoleon's campaign in Sicily, he expelled the tyrant Hippo from Messana in 342.

Messana was seized by Agathocles, the tyrant of Syracuse in 315, during his wars with the Carthaginians. Following Carthages' defeat of Agathocles in 311, Messana sided with Carthage.

In 289, Messana was seized by Campanian mercenaries, who called themselves the Mamertini. They slaughtered the leading men of Messana and appropriated their wives, possessions, and lands. At first they called upon Carthage for help against Syracuse and then drew support from Rome—helping cause the outbreak of the First Punic War in 264. When the First Punic War eventually ended, in 241, Messana thrived as a free city and an

ally of Rome.

Appendix: Quotable Quotes—Greeks on War

Introduction

The quotations below are a mix of famous and less well-known ancient Greek quotations relating to conflict. They are organized alphabetically by speaker; multiple quotations from a single speaker are ordered chronologically. Where necessary, the quotation is preceded by a short comment placing it in context. Some caution is recommended where the author recording the words was considerably later than the incident, especially where they come from collections of sayings such as Plutarch's. For example, his *Sayings of the Spartans* ascribes the Spartan question in response to being shown particularly strong city walls—"what women live there?" to at least half a dozen different Spartans. Where the quotation comes from a speech, it should be noted that in composing the speeches in their works, rather than preserving what the original speaker said, historians in antiquity often regarded this as an opportunity to display their own oratorical skills.

Achilles (Mythical Hero)

1. In the *Iliad*, Achilles' mother, the goddess Thetis, has told him that he has the choice of two fates, as he discloses:
"If I stay here and besiege the city of the Trojans, any chance of a return home is lost to me, but my fame will be undying. If I come home to my dear native land, gone is my great renown, but my life will be long and the end will not quickly come upon me."

In *Iliad* 18, by choosing to avenge his friend Patroclus and kill the Trojan hero Hector, Achilles understands that he is choosing the former of the two fates.

Source: Homer, *Iliad* 9.412–416, translated by Peter Londey.

2. In Homer's *Odyssey*, set after the end of the Trojan War, Odysseus visits the underworld and meets the dead Achilles, who tells him:
"Do not speak lightly of death, glorious Odysseus. I would rather be alive serving another as a hireling in the house of a poor man who does not have much to live on than to lord it over all the spirits of those who have perished."

Source: Homer, *Odyssey* 11.488–491, translated by Peter Londey.

Agesilaus II, King of Sparta (Reigned ca. 401–360)

3. When the Persian satrap Tissaphernes declared war on Agesilaus, even though they had a treaty, Agesilaus responded by deceiving Tissaphernes into thinking he was going to invade Caria and then seized large parts of Phrygia. He stated:
"To act unjustly after swearing a treaty is impious, but to trick the enemy is not only just and noble but also pleasant and profitable."

Source: Plutarch, *Sayings of the Spartans* 2.11 (*Moralia* 209a-b), translated by Iain Spence (similar sentiments are ascribed to Cleomenes I, *Sayings of the Spartans* 45.3 [*Moralia* 223a-b]).

4. "Leaders should be superior to their men in endurance and courage, not in soft living."

Source: Plutarch, *Sayings of the Spartans* 2.19 (*Moralia* 210a), translated by Iain Spence.

5. When asked how far Spartan territory extended, Agesilaus held out his spear and said:
"As far as this can reach."

Source: Plutarch, *Sayings of the Spartans* 2.28 (*Moralia* 210e), translated by Iain Spence (also ascribed to Archidamus III, *Sayings of the Spartans* 20.2 [*Moralia* 218f]).

6. When asked why Sparta had no city walls, Agesilaus pointed to some citizens equipped as hoplites and said:
“These are Sparta’s walls.”

Source: Plutarch, *Sayings of the Spartans* 2.29 (*Moralia* 210e), translated by Iain Spence.

Agis II, King of Sparta (ca. 460–ca. 399)

7. “Spartans do not ask how many enemy there are but where they are.”

Source: Plutarch, *Sayings of the Spartans* 2.19 (*Moralia* 215d), translated by Iain Spence.

Alexander III (the Great) of Macedon (356–323)

8. When Darius III offered to give Alexander 10,000 talents, his daughter as a wife, and all his territory west of the Euphrates River (332), Parmenion said “If I were Alexander I would accept this offer.” Alexander replied: “I would too, by Zeus, if I were Parmenion.” He then wrote to Darius demanding his surrender.

Source: Plutarch, *Alexander* 29.4, translated by Iain Spence (a similar remark is also ascribed to Callicratidas, a Spartan admiral [died 406], Plutarch *Sayings of the Spartans* 43.1 [*Moralia* 222c]).

9. When Parmenion and other senior commanders, overawed by the size of the Persian army facing them at Gaugamela (331) advised Alexander to attack at night, Alexander replied:
“I will not steal the victory.”

Source: Plutarch, *Alexander* 31.7, translated by Iain Spence.

10. Alexander (unsuccessfully) tried to persuade his troops in India to keep

advancing east (326) by saying the following:

“Those who endure toil and dangers achieve great deeds and it is a sweet thing to live with courage and to die leaving behind a deathless renown.”

Source: Arrian 5.26.4, translated by Iain Spence.

Archidamus II, King of Sparta (d. ca. 427/6)

11. In a speech to the Spartan assembly debating whether to go to war against Athens, Archidamus said:

“War is a matter not so much of arms but of resources which make arms of use—especially in a contest with a maritime power.”

Source: Thucydides 1.83.2, translated by Iain Spence.

Brasidas, Spartan General (d. 422)

12. In a speech to encourage the defenders of Amphipolis before making a sally against the Athenian army outside the walls (422), Brasidas said:

“Whoever sees most clearly when the enemy makes such errors as these and, carefully considering the strength of his own forces, attacks not on conventional lines but in the way best suited to the situation will succeed. For these stratagems, which utterly deceive the enemy, bring the greatest glory and the greatest service to our friends.”

Source: Thucydides 5.9.4, translated by Iain Spence.

13. “Remember that willingness, a sense of honor, and obedience to his commanders are what makes a good soldier and, today will make you either freemen and allies of Lacedaemon or slaves of Athens.”

Source: Thucydides 5.9.9, translated by Iain Spence.

Callicrates, Spartan (d. 479)

14. During the prebattle sacrifices at Plataea, Callicrates, reputedly the best looking man in the Greek army, was hit in the side by an arrow. He was carried away and before dying is reported as saying that:

“He did not regret dying for Greece only that he had not struck a blow nor achieved any deed worthy of him despite his eagerness to do so.”

Source: Herodotus 9.72.2, translated by Iain Spence (also recorded with a slight variation emphasizing the bravery of a hoplite over an archer in Plutarch, *Sayings of the Spartans* 69.46 [*Moralia* 234e] as: “It doesn’t worry me that I am dying, but that I should be killed by a woman’s arrow before achieving anything.” Translated by Iain Spence).

Callicratidas, Spartan Naval Commander (d. 406)

15. “I am going to stop you, Conon, from treating the sea like your whore.”

Source: Xenophon, *Hellenica* 1.6.15, translated by Douglas Kelly.

16. On being told his fleet was outnumbered prior to the battle of Arginusae (406), Callicratidas replied:

“Sparta will be no worse off if I am killed but running away is disgraceful.”

Source: Xenophon, *Hellenica* 1.6.32, translated by Douglas Kelly.

17. On being told that the omens predicted his death at Arginusae, Callicratidas said:

“The affairs of Sparta do not depend on one man.”

Plutarch criticized this statement as failing to take into account the importance of a general to his forces.

Source: Plutarch, *Pelopidas* 2.1, translated by Peter Londey.

Clearchus, Spartan Exile and Mercenary Commander (d. 401)

18. “An army without field punishment is absolutely useless.”

Source: Xenophon, *Anabasis* 2.6.10, translated by Douglas Kelly.

19. “A soldier should be more afraid of his general than the enemy.”

Source: Xenophon, *Anabasis* 2.6.10, translated by Douglas Kelly.

Croesus of Lydia (Mid-Sixth Century)

20. Explaining why he considered Apollo (through the Delphic oracle) responsible for his decision to attack Persia, which had just resulted in the Persian capture of his territory and himself (ca. 547), Croesus said:

“For nobody is so stupid as to choose war over peace: in war fathers bury sons, in peace sons bury fathers.”

Source: Herodotus 1.87.4, translated by Iain Spence.

21. Having been reprieved by Cyrus the Great, who had just captured his kingdom and its capital Sardis (ca. 547), Croesus pointed to Cyrus’ troops who were sacking Sardis and asked what they were doing. When Cyrus said they were sacking Croesus’ city and looting his property, Croesus replied:

“They are not looting *my* city and property, for none of it is now mine: they are looting *your* property.”

Source: Herodotus 1.88.4, translated by Iain Spence.

Damis, Spartan (Active 320s)

22. When Alexander III (the Great) of Macedon sent a message to the Greeks requiring that he be proclaimed a god, Damis replied:

“We agree that if Alexander wishes to be called a god he can be.”

Source: Plutarch, *Sayings of the Spartans* 25.1 (*Moralia* 219e), translated by Iain Spence.

Dieneces, Spartan (d. 480)

23. On being told by a man from Trachis prior to the battle of Thermopylae (480) that the Persians were so numerous that their arrows would blot out the sun, Dieneces replied:

“The stranger from Trachis brings good news—if the Persians hide the sun with their arrows, we shall have our battle in the shade and not in the sun.”

Source: Herodotus 7.226.1, translated by Iain Spence (also ascribed to Leonidas I by Plutarch, *Sayings of the Spartans* 51.6 [*Moralia* 225b]).

Demaratus, King of Sparta (Reigned ca. 515–491)

24. When asked why the Spartans disgraced those who lost their hoplite shields but not their helmets or breastplates, Demaratus replied:

“Because these are for their personal benefit, a shield is for the good of the whole line.”

Source: Plutarch, *Sayings of the Spartans* 28.2 (*Moralia* 220a), translated by Iain Spence.

Demosthenes (ca. 384–322)

25. On the war with Philip II of Macedon (351), Demosthenes remarked:

“My view is that the first step is for us to mobilize a force in advance that will carry on the war on a continuing basis and inflict damage on Philip. But, please, no mention of 10,000 or 20,000 mercenaries or of those forces that exist only on paper.”

Source: Demosthenes 4 (*First Philippic*) 19, translated by Douglas Kelly.

26. “There is something rotten in Philip’s position and the course of the war is what will bring it out, so long as we show some determination.”

Source: Demosthenes 4 (*First Philippic*) 44, translated by Douglas Kelly.

Hippocrates, Spartan (Active 410)

27. Hippocrates, the Spartan deputy commander at the naval defeat at Cyzicus, reported the defeat and the death of his admiral, Mindarus, to Sparta in a letter that was reportedly captured and sent to Athens instead. There may be some Athenian embellishment to the report, which is delivered in a suspiciously laconic style:

“Ships are lost. Mindarus is dead. The men are starving. We don’t know what to do.”

Source: Xenophon, *Hellenica* 1.1.23, translated by Iain Spence.

Leonidas I, King of Sparta (d. 480)

28. On being asked why the best men value an honorable death over an inglorious life, Leonidas replied:

“Because they consider one comes from nature, the other from within themselves.”

Source: Plutarch, *Sayings of the Spartans* 51.14 (*Moralia* 225d), translated by Iain Spence.

29. When Xerxes demanded Leonidas surrender his arms at Thermopylae (480), Leonidas replied:

“Come and get them.”

Source: Plutarch, *Sayings of the Spartans* 51.11 (*Moralia* 225d), translated by Iain Spence.

Melesippus, Spartan Ambassador (Active 431)

30. When Athens refused to negotiate on the eve of the Second Peloponnesian War (431), Melesippus commented:

“This day will be the beginning of terrible disasters for Greece.”

Source: Thucydides 2.12.3, translated by Douglas Kelly.

Pausanias Son of Cleombrotus (d. 470)

31. After his victory at Plataea (479), Pausanias was struck by the luxury of the Persian commanders' possessions. He had the captured Persian cooks prepare a meal typical of those they prepared for Mardonius and his own men prepare a typical Spartan meal for him. He then showed these to the Greek commanders, saying:

"Gentlemen of Greece, I brought you here to show you that the Persian King is stupid. He lives in such a way as this but comes here to take away our meager possessions."

Source: Herodotus 9.82.3, translated by Iain Spence (also recorded with a slight variation in Plutarch, *Sayings of the Spartans* 58.6 [*Moralia* 230e-f]).

Paedaretus, Spartan (Unknown Date)

32. When someone commented that the enemy were very numerous, Paedaretus replied:

"Well then, we shall be even more famous because we shall kill more."

Source: Plutarch, *Sayings of the Spartans* 60.1 (*Moralia* 231b), translated by Iain Spence.

Pericles (ca. 495–429)

33. Outlining his strategy on the eve of the of the Second Peloponnesian War (432), Pericles said:

"The Peloponnesians are small farmers, without any money of their own or in the treasury. They have no experience of prolonged wars overseas because poverty lets them conduct only short campaigns against one another."

Source: Thucydides 1.141.3, translated by Douglas Kelly.

34. "I am more anxious about Athenian blunders than enemy strategy."

Source: Thucydides 1.144.1, translated by Douglas Kelly.

35. Encouraging the Athenians to stick to his plan not to engage the

Peloponnesian invaders who were ravaging Attica (431), Pericles said:
“Trees can quickly grow again, even though felled or lopped, but it is not easy to replace men who are killed.”

Source: Plutarch, *Pericles* 31.4, translated by Iain Spence.

36. From Pericles’ funeral speech at the public burial of those who died in the first year of the Second Peloponnesian War, winter 431:

“We trust more in our natural ability than planning processes and stratagems. In education, while they [the Spartans] undergo a painful regime from birth to instill manliness, we live without these restraints but are just as willing to face danger.”

Source: Thucydides 2.39.1, translated by Iain Spence.

37. “The men most justly called the bravest are those who can truly judge between pleasure and pain but never shrink from facing dangers.”

Source: Thucydides 2.40.3, translated by Iain Spence.

38. “Our daring has made every sea and every land open to us and everywhere we have left everlasting memorials to our success and failure.”

Source: Thucydides 2.41.4, translated by Iain Spence.

39. “In the fighting, choosing to stand and die rather than surrender and live, and fleeing only from dishonor, they were taken in one brief moment at the climax of their lives, freed from fear but not from glory.”

Source: Thucydides 2.42.4, translated by Iain Spence.

40. “Heroes have the whole earth for their tomb.”

Source: Thucydides 2.43.3, translated by Iain Spence.

41. Pericles said the following to the Athenian assembly in the first year of the Second Peloponnesian War (431):

“The empire that you possess is like a tyranny. It may seem unjust to have acquired it but it is perilous to let it go.”

Source: Thucydides 2.63.2, translated by Douglas Kelly.

42. On his deathbed (429), Pericles said the following:
“No Athenian ever put on mourning dress because of me.”

Source: Plutarch, *Pericles* 38.4, translated by Iain Spence.

Poseidon (Greek God) in Euripides (415)

43. Poseidon speaks the following in Euripides’ play *Trojan Women*, which is often thought to be a critical response to the destruction of Melos by the Athenians in 416:

“Stupid is the mortal man who plunders cities and temples and tombs, the sacred places of the dead. Having made a desolation, he himself perishes later.”

Source: Euripides, *Trojan Women* 95–97, translated by Peter Londey.

Spartan (Unknown)

44. The epitaph, generally attributed to Simonides, placed by the Spartans over their dead at Thermopylae (480):

“Stranger, tell the Lacedaemonians that we lie here obedient to their laws.”

Source: Herodotus 7.228.2, translated by Iain Spence.

45. An unnamed Spartan prisoner captured on Sphacteria (425), when insultingly asked if those who had fallen in the battle were the best and bravest men replied:

“A spindle (by which he meant an arrow) would be worth a great deal if it could pick the brave men from the cowards.”

Thucydides adds the gloss that “by this he meant that the dead were those who happened to be hit by the stones and arrows.”

Source: Thucydides 4.40.2, translated by Iain Spence (a similar remark is ascribed to Phoebeidas ca. 370, Plutarch, *Sayings of the Spartans* 65.1

[*Moralia* 231f]).

46. When the Thebans were arguing with them about something, a Spartan said:

“You should either have less pride or more power.”

Source: Plutarch, *Sayings of the Spartans* 69.3 (*Moralia* 232e), translated by Iain Spence.

47. When asked why the Spartans used short swords, one replied:

“So we can get close to the enemy.”

Source: Plutarch, *Sayings of the Spartans* 69.5 (*Moralia* 232e), translated by Iain Spence (a similar statement is also ascribed to Antalcidas, *Sayings of the Spartans* 14.8 [*Moralia* 217e]).

48. When someone saw a picture showing Spartans being killed by Athenians and commented “the Athenians are indeed brave” a Spartan replied:

“Yes—in a picture.”

Source: Plutarch, *Sayings of the Spartans* 69.9 (*Moralia* 232f), translated by Iain Spence.

49. When an Argive said “We have the graves of many Spartans in our country” a Spartan replied:

“But we have not one grave of an Argive in ours.”

Plutarch adds the gloss “meaning that the Spartans had often invaded Argos, but the Argives had never invaded Sparta.”

Source: Plutarch, *Sayings of the Spartans* 69.20 (*Moralia* 232c), translated by Iain Spence.

50. When Philip (the V of Macedon?) wrote to the Spartans when he entered their country and asked whether they wanted him to come as a friend or an enemy, they replied:

“Neither.”

Source: Plutarch, *Sayings of the Spartans* 69.28 (*Moralia* 233e), translated by

Iain Spence.

51. When a Spartan was asked what he knew, he replied:
“How to be free.”

Source: Plutarch, *Sayings of the Spartans* 69.37 (*Moralia* 234b), translated by Iain Spence.

A Man of Sybaris

52. Sybaris, a town in southern Italy destroyed in 510, was famous for its luxury, not always approved of by other Greeks. It was natural therefore to attach the following (probably apocryphal) quotation to an anonymous man of Sybaris:

“He said about the Spartans that their desire to die in war was not such a great thing given that it was their means of escape from so many toils and such a way of life.”

Source: Plutarch, *Pelopidas* 1.2–4, translated by Peter Londey.

53. Plutarch quotes the comment above in #52 straight after that of a soldier speaking to Antigonus (Monophthalmus, presumably). The soldier had been very brave, but had also suffered from some chronic disease. Antigonus’ doctors were able to cure him, after which he proved less brave in battle. When asked why, his reply was:

“King, you yourself have made me more cowardly by freeing me from those troubles which left me with little desire to live.”

Source: Plutarch, *Pelopidas* 1.2–4, translated by Peter Londey.

54. Finally, Plutarch quotes the following, sometimes attributed to Simonides:

“They died not reckoning either to live or to die as good, but rather to achieve either one in a noble way.”

Source: Plutarch, *Pelopidas* 1.2–4, translated by Peter Londey.

Themistocles, Athenian Admiral and Statesman (ca. 528–460)

55. During the Greek debate over engaging the Persians at Salamis (480), the Corinthian admiral, Adeimantus, referring to Themistocles' vigorous speech, said:

“Themistocles, in the games, those who start before the signal is given are beaten!”

Themistocles replied:

“But those who are left behind don't win the crown.”

Source: Herodotus 8.59.2, translated by Iain Spence.

Timotheus (ca. 415–354)

56. When another general was showing off the wounds he had received, Timotheus pointed out the folly of a general who exposes himself to danger, and thus risks leaving his forces leaderless:

“I felt great shame when I was besieging Samos and an arrow fell near me, because I was acting more like an inexperienced youth than a general commanding so great a force.”

Despite this wise advice, many Greek generals fell in battle.

Source: Plutarch, *Pelopidas* 2.3, translated by Peter Londey.

Tyrtaeus (ca. 680–620)

57. The Spartan poet Tyrtaeus wrote to exhort men to face the terrors of the new hoplite style of combat, but centuries later Spartan armies still listened to recitations of his poems.

“But let every man stand fast with feet apart, firmly rooted to the ground, biting his lips with his teeth, with thighs and shins below and breast and shoulders covered by the hollow of his broad shield. Let him brandish his mighty spear in his right hand and shake the fearful crest above his head. Doing mighty deeds, let him learn to wage war, and not stand with his shield outside the range of missiles,

but coming up close let him take his opponent, striking him with the long spear or sword, and setting foot beside foot and pressing shield against shield, with crest against crest, helmet against helmet, breast against breast let him fight his man at close quarters, wielding the hilt of his sword or his long spear.”

Source: Tyrtaeus, fragment 11, lines 21–34, translated by Peter Londey.

Xenophon (ca. 430–ca. 353)

58. Xenophon’s advice to aspiring *hipparchoi* or cavalry commanders (ca. 365):

“In order to instill discipline in one’s subordinates it is important both to lecture them on obedience and by your actions to confer advantage on the disciplined and disadvantage on the ill-disciplined.”

Source: Xenophon, *Cavalry Commander* 1.24, translated by Iain Spence.

59. “A man can shape nothing according to his wishes unless the material he molds is ready to obey the craftsman’s will. Nor can anyone make anything of men unless, with the god’s help, they are prepared to view their commander with friendly feelings and to consider him wiser than they in the conduct of operations against the enemy.”

Source: Xenophon, *Cavalry Commander* 6.1, translated by Iain Spence.

60. “It is sufficient to read this advice a few times, but a commander must always decide on the right thing at the right time, considering the current situation and, in light of it, do what is required. To write down everything he ought to do is no more possible than knowing everything which is going to happen.”

Source: Xenophon, *Cavalry Commander* 9.1, translated by Iain Spence.

Zeuxidamus, King of Sparta (Active Third Quarter of the Seventh Century)

61. When an Aetolian expressed the view that for those able to be brave men, war is better than peace, Zeuxidamus replied:

“No, by god, for these men death is better than life!”

Source: Plutarch, *Sayings of the Spartans* 34.2 (*Moralia* 221c), translated by Iain Spence.

Primary Documents

The primary documents are ordered chronologically by author. With the exception of the inscriptions, all the authors included here have a separate, more detailed, entry in the body of this encyclopedia. Where a work is divided into books, chapters, and sections, the document is divided by chapters—a number in square brackets in the text indicates the section. Anything else in square brackets is an explanatory item inserted by the translator and not part of the original work. A gap in the document is indicated by "...". The author's date is given in the author's main heading, the date of the event in the document is in the document heading.

Archilochus (ca. 680–640)

Archilochus was a well-known poet and mercenary soldier from the island of Paros who lived ca. 680–640. Although born on Paros, he lived on Thasos, campaigned in Thrace, and died in battle on Naxos. The two poems below illustrate his very practical attitude toward soldiering, which was probably fairly typical of professional soldiers at the time.

1. Archilochus, Poem 6. “The Shield”

Introduction

Poem 6 deals with the sensitive issue of rhipsaspis—throwing away one's shield to run away from battle faster. In hoplite warfare, the integrity of the line of shields in the phalanx was crucial and throwing away your shield

was seen as cowardly, contemptible, and letting down your fellow citizens (see QQ 24). In Classical Athens, for example, it was an indictable offence (see also Polybius 4.58.1, Document 22). Archilochus may have been serving as a citizen soldier or as a mercenary in this incident, but he chooses to make light of something which would ordinarily have been a cause of shame.

Document

Some Saian rejoices in the shield, an unblemished item, which I unwillingly abandoned beside a bush—but I saved myself. What do I care for that shield?

Sod it. I'll buy another one, just as good.

Translated by Iain Spence.

2. Archilochus, Poem 60. “The General”

Introduction

Poem 60 gives Archilochus’ humorous take on a serious subject—the competence of his military leader.

Document

I do not like a tall general with long striding legs or braids, nor proud of his hair or partly shaved.

Let me have a short general clearly bowlegged around his knees, going firmly on his feet, full of heart.

Translated by Iain Spence.

Herodotus (ca. 485–ca. 425)

Herodotus composed the *Histories* ca. 450–420, basing them on oral tradition and interviews—in some cases of eyewitnesses. Although known as “the father of history,” he has often been criticized for believing, and repeating “tall tales.” However, he makes it clear that his business is to record what he was told, even though he does not necessarily believe it himself—and let the readers make up their own minds. The *Histories* record

the Persian Wars of 490 and 480–479, with much of the work dealing with the background history of the Greeks and Persians and their relationships before the war.

3. Herodotus 6.110–117. The Battle of Marathon (490)

Introduction

This document is the earliest surviving account of the battle of Marathon (490), which ended the Persian attempt to punish Eretria and Athens for their support to the Ionian Greeks during their revolt from Persia (499–493). The Athenians had marched out accompanied by their Plataean allies to meet the Persians on the plain of Marathon and prevent them marching overland to Athens.

Herodotus appears to have had little or no military experience and his descriptions of battles often have problems. In this case, for example, he records that the Persian expeditionary force had a cavalry contingent with it, but makes no mention of its presence or activity in the battle. This has led historians to speculate that it was either still on Eretria, was moving ahead of the army, or had been re-embarked with the fleet. Contrary to the impression given by Herodotus, the strengthening of the Greek wings was highly likely to have been deliberate. According to Herodotus (6.109) the board of ten strategoi (generals) was equally split over whether to fight or not and the decision to engage was made on the vote of Callimachus, the polemarch (“War Archon”), after a convincing speech by Miltiades, who had experience of the Persians from the Thracian Chersonese. Marathon made a huge impact on Athens, significantly increasing its reputation throughout Greece and assuming a major place in the city’s consciousness—the festival referred to at 111.2 is the Great Panathenaea, the largest festival celebrated at Athens. Cynegirus (114) was the brother of the famous tragedian Aeschylus. Finally, 117.2–3 preserves an interesting account of a battlefield epiphany that struck Epizelus blind—perhaps one of the earliest examples of PTSD. In the translation we have used “Persians” throughout, rather than the less familiar “Medes” of the original.

Document

6.110. By saying this Miltiades won over Callimachus. The polemarch’s vote was counted in, and the decision to attack was taken. After this, the generals

who had voted to fight turned the command [literally “presidency”—of the board of generals] over to Miltiades as each one’s day came in turn. He accepted the office but did not attack until his own appointed day to command.

111. When his turn came round, the Athenians deployed for battle, with the polemarch Callimachus commanding the right wing, since it was then the Athenian custom for the polemarch to hold the right wing [the place of honor on the battlefield]. Callimachus led, and the other tribes were counted out in succession next to each other. The Plataeans were marshaled last, holding the left wing. [2] Ever since that battle, when the Athenians are conducting sacrifices at the festivals every fourth year, the Athenian herald prays for good things for the Athenians and Plataeans together. [3] The Athenian deployment at Marathon resulted from making their frontage equal in length to the Persians. The center, where the line was weakest, was only a few ranks deep, but each wing was numerically strong.

112. When they had been set in order and the sacrifices were favorable, the Athenians were ordered forward and charged the enemy [literally *hoi barbaroi*: “the barbarians” or “foreigners”] at a run. The space between the armies was no less than 8 stades [1,600 meters or just under a mile]. [2] The Persians saw them running to attack and prepared to meet them, thinking the Athenians absolutely crazy, since they saw how few of them there were and that they ran up so fast without either cavalry or archers. [3] So the barbarians imagined, but when the Athenians all together fell upon them they fought in a way worthy to record. These are the first Greeks we know of to charge the enemy at a run. They were also the first to endure looking at Persian costume and the men wearing it, for until then just hearing the name of the Persians caused Greeks to panic.

113. They fought a long time at Marathon. In the center of the line, where the Persians and Sacae were stationed, the barbarians were victorious. Prevailing there, the barbarians broke through in pursuit inland, but on each wing the Athenians and Plataeans won. [2] In victory they let the routed barbarians flee, and brought the wings together to fight those who had broken through the center. The Athenians won, then followed the fleeing Persians and struck them down. When they reached the sea they demanded fire and laid hold of the Persian ships.

114. It was in this task that Callimachus the polemarch was slain, a brave man, and one of the generals, Stesilaus son of Thrasylaus, also died.

Cynegirus son of Euphorion fell there, his hand cut off with an ax as he grabbed a ship's stern. Many other famous Athenians also fell there.

115. In this way the Athenians captured seven ships. The barbarians pushed off with the rest, picked up the Eretrian slaves from the island where they had left them, and sailed around Sunium—hoping to reach the city before the Athenians. There was an accusation at Athens that the Persians did this in accordance with a plan devised by the Alcmaeonidae, who it is said held up a shield as a signal once the Persians were in their ships.

116. But while they sailed around Sunium, the Athenians marched back to defend the city as fast as they could and got there ahead of the barbarians. Coming from the sacred place of Heracles in Marathon, they pitched camp in the sacred place of Heracles in Cynosarges. The barbarians lay at anchor off Phalerum, the Athenian naval port at that time. After lying at anchor there for a while, they sailed their ships back to Asia.

117. In the battle at Marathon about 6,400 Persians were killed, and 192 Athenians; these were the numbers who fell on each side. [2] The following marvel happened there: an Athenian, Epizelus son of Couphagoras, was fighting as a brave man in the battle when he went blind, although he was struck or hit nowhere on his body; from that time on he spent the rest of his life in blindness. [3] I have heard that he tells this story about his misfortune: he saw opposing him a tall heavy armed man [literally, “hoplite”], whose beard overshadowed his shield, but the phantom passed him by and killed the man next to him. I learned by inquiry that this is the story Epizelus tells.

4. Herodotus 7.9. The Persian View of Greek Warfare (ca. 485)

Introduction

This document is set at the Persian court, ca. 485 and is part of Mardonius' successful advice to Xerxes to persuade him to invade Greece, precipitating the Second Persian War (480–479). Herodotus cannot have been present on the occasion and it is difficult to imagine how he might have learned of the content of the conversation. The advice is therefore almost certainly

fictional, either composed by Herodotus for dramatic effect or preserving Greek oral tradition of the events. The document contains the Greek sentiment that Greeks were united by a common culture and language and so should not fight each other. It also has rather a jaundiced view of the severity of hoplite warfare and its lack of sophistication. Although modern commentators have sometimes accepted this as an accurate picture of hoplite warfare, it is at odds with the course of the campaign of 480–479. On both land (Thermopylae) and sea (Artemisium and Salamis) the Greeks deliberately selected restricted sites to negate the Persian numerical advantage. Even at Plataea, which was the most traditional set piece battle of the war, the Greeks kept to the foothills for as long as possible to reduce the effectiveness of the Persian cavalry.

Document

7.9. Whenever they declare war on each other they find the best-looking and most level ground and go there to fight. As a result, the victors come off with great losses and I will say nothing about the losers for they are utterly destroyed. [2] As they speak the same language, what they ought to do is use heralds and messengers to sort out their differences—anything is better than fighting. If it is absolutely necessary to wage war against each other they each ought to find the most defensible spot and make their stand there.

Translated by Iain Spence.

5. Herodotus 8.6–13. The Battle of Artemisium (480)

Introduction

This document describes the battle of Artemisium—the naval half of the joint land and sea line of defense against the Persians. Although the Greek fleet held its own at Artemisium it was forced to withdraw when the Persians overcame the land half of the defense at Thermopylae. Herodotus' account illustrates the Greek tactic of choosing narrow areas in which to fight and the naval tactics of the time. Although ramming occurred, the main tactic was for the marines to board the enemy ship and here the Greeks showed their clear superiority. However, Thucydides (2.83–84, Document 8) shows how old-fashioned and ineffective these tactics had become by 429/8 when the Athenians literally ran rings around a

Peloponnesian fleet that attempted it. The document also illustrates Herodotus' tendency to highlight the role of the gods and the Athenians.

Document

8.6. In this way then they [the Greek fleet] remained at Euboea and fought a sea battle. It occurred as follows. The barbarians [Persians] had arrived at Aphetae around the early afternoon and having heard even earlier that few Greek ships were at Artemisium, when they saw them they were eager to come to grips, hoping they would capture them. [2] They did not think a frontal attack was a good idea because the Greeks might flee when they saw them coming and night would fall during the pursuit. They believed that in this way the Greeks would escape them but their intent was to ensure not even a firebearer [the man who carried the fire for ceremonial sacrifices and who was inviolable] might survive.

7. To achieve this they therefore devised the following plan. Selecting 200 of their ships, they sent them outside Sciathus so they would not be seen by the enemy, sailing around Euboea past Caphareus and Geraestus to surround the Greeks—those who had sailed around blocking their withdrawal while they attacked from the front. [2] Having decided this they dispatched the selected ships, planning not to attack the Greeks during the day nor indeed before they saw the prearranged signal from the blocking contingent that it had arrived. So, they sent the ships off and mustered the rest at Aphetae.

8. [Scyllias the diver defects to the Greek fleet and warns them of the Persian plan; Herodotus dismisses the tale that he swam underwater the entire distance between the fleets].

9. Having heard the news, the Greeks debated among themselves. After much discussion it was decided to remain there for the rest of the day but to sail out in the dead of night to meet the Persian ships sailing around. But after this, as nobody attacked them [from the main Persian fleet] the Greeks waited for the late afternoon and sailed out against the barbarians [i.e., the main fleet] wanting to test out their tactics and battle drills.

10. Seeing the small number of Greek ships sailing against them, Xerxes' generals and men were convinced they were insane. They put to sea, thinking to easily overcome the Greeks—and quite reasonably so as they saw the Greek ships were few in number and their own much more numerous and more seaworthy. [2] Thinking this, they surrounded the

Greeks. Now, all the Ionians [i.e., Ionian Greeks] who were friendly toward the Greeks and serving unwillingly, were greatly distressed seeing them surrounded and in such a weak position, thinking none would return home. [3] But those who were pleased by the situation competed to be the first to capture an Athenian ship and be given gifts by the king—for the talk in their fleet was all about the Athenians.

11. But when the Greeks received the first signal they gathered their sterns together, with the bows toward the barbarians. On the second signal, even though they were hemmed in in a narrow space, they set to work, head to head. [2] There they captured 30 enemy ships and even Philaon, son of Chersis, brother of Gorgus, king of Salamis and a notable man in the fleet. The first of the Greeks to capture an enemy ship was an Athenian, Lycomedes, son of Aeschraeus, and he was awarded the prize for valor. [3] Nightfall left the battle unresolved and the combatants dispersed. The Greeks went to Artemisium the barbarians to Aphetæ, having done much worse than they expected. In this battle, Antidorus of Lemnos, alone of all the Greeks serving with the King deserted to the Greeks and for this the Athenians gave him land in Salamis.

12. When night fell, as it was midsummer, torrential rain fell throughout the night with violent thunder from Pelion. The corpses and ship wreckage were washed ashore at Aphetæ and tangled around the prows and around the banks of oars. [2] Hearing all this, the sailors there became frightened and were convinced their current evil state would cause their total destruction. For, before they had drawn breath from the storm and shipwreck off Pelion, the hard sea battle had overtaken them and after that now this furious storm, harsh thunder, and torrents of water rushing from land toward the sea.

13. This was the sort of night they had, but to the contingent sent around Euboea the same night was much more cruel because they were caught in the open sea and their end was miserable. The storm and rain hit them while sailing off the Hollows of Euboea, and blown along by the wind and unable to see where they were heading, they crashed into the rocks. All of this was god's work so that he might make the Persian force more equal to the Greeks instead of much greater.

Translated by Iain Spence.

Athenian Inscription (480?)

6. Epigraphic Museum (Athens) 13330. “The Decree of Themistocles” (480)

Introduction

This inscription purports to be an Athenian decree recording a successful motion by the Athenian strategos (general) Themistocles in 480 for evacuating Athens and fighting the Persian invasion by sea. Although Demosthenes mentioned such a decree in 374 and its wording matches a quotation in Plutarch, its authenticity has been strongly contested. The decree was found in Troezen, the lettering is clearly third century, and it is rare to find a proposer listed by both deme and patronymic (father's name) before about 350. It is therefore either a later forgery, perhaps to add weight to Athens' claim to fame from Salamis, or a later copy of an original decree. The weight of modern scholarly opinion is probably slightly more on the side of forgery, but the copy theory is also possible, especially if it was a paraphrase of the original (or a combination of more than one decree). One of the main objections, that the decree is contradicted by Herodotus' account has been rejected (e.g., by Fornara) on the basis that the main contradiction is with modern interpretations of Herodotus rather than Herodotus' text. If the decree is accepted as genuine, it reinforces those passages in Herodotus suggesting that the Athenians decided fairly early to evacuate the city and focus their defense on the navy and Salamis.

The document has several interesting features, including the appointment of ships' captains “from among those who own land and a house in Athens and who have legitimate children.” In Athens, and elsewhere in Greece, it was thought men like these with a real stake in the country would fight hardest for it. The marines referred to were equipped as hoplites and enjoyed a considerable advantage over their more lightly equipped Persian counterparts (see illustrations in Hoplites, Naval Warfare, and Persian [Achaemenid] Empire entries). The “lexiarchic registers” listed all citizens. After Marathon (see Document 3) the Polemarch (“War Archon”) had lost his military function, but had responsibility for various aspects of the city's metics (resident aliens), including registering them.

Note that the document is in the form of a complete translation,

restoring the gaps in the text. This is the most reader-friendly way of providing the document, but has the disadvantage that the reader cannot see which parts are restored. Restoration is done by matching gaps to quotations of the inscription in ancient authors, by restoring formulaic expressions from other inscriptions, or simply deciding what best fits in the gaps. This is aided by the fact that the text was stoichedon, that is, every line had the same number of letters. However, in some cases the restoration can only be conjecture. If the reader wants to see which parts are restored, the original text is accessible in Meiggs, Russell, and Lewis, David. 1969. A Selection of Greek Historical Inscriptions. Oxford: Clarendon Press and there is a translation indicating restorations in Fornara, Charles W. 1977. Archaic Times to the End of the Peloponnesian War. Baltimore: Johns Hopkins University Press.

Document

To the Gods. Decided by the *Boule* [i.e., the Council of 500] and the People. Themistocles son of Neocles of Phrearrhioi proposed. The city shall be entrusted to Athena, Mistress of Athens, and to all the other gods, for protection and defense against the Barbarian [i.e., the Persians] on behalf of the country. All of the Athenians and the resident aliens who live in Athens shall send their women and children to Troezen ... [there is a gap of 21 letters here] ... the Founder of the land. They shall send the elderly and their movable property to Salamis. The Treasurers and Priestesses shall stay on the Acropolis to guard the gods' property. All the rest of the Athenians and the resident aliens who have reached military age shall board the 200 ships prepared and resist the Barbarian for the sake of freedom, both theirs and that of the other Greeks, together with the Lacedaemonians, Corinthians, and Aeginetans, and all the rest who wish to have a share of the danger. Beginning tomorrow, the *strategoi* [generals/admirals] shall appoint 200 trierarchs [ships' captains], one for each ship, from among those who own land and a house in Athens and who have legitimate children. These men shall not be over 50 years old and shall be appointed to a ship by lot. The generals shall also enlist marines, 10 per ship, from men between 20 and 30 years old, and 4 archers. They shall appoint these [probably the marines and archers, although the Greek term used could mean the specialist crewmen, such as the helmsman] by lot to the ships at the same time they appoint the trierarchs by lot. The generals shall also write on white notice boards the

lists of the rest of the crew by ship, selecting the Athenians from the lexiarchic registers and the resident aliens from the Polemarch's list of names. They shall write them up, assigning them by divisions, 200 [divisions], each about 100 men, and they shall write at the top of each division the name of the trireme, the trierarch and the soldiers [the Greek term could refer to the marines and archers above but also to the specialist crewmen], so that the men know the trireme on which each division shall embark. When all the divisions have been created and allotted to the triremes, after sacrificing to Zeus the All-powerful, Athena, Nike [Victory], and Poseidon the Securer, the *Boule* and the generals shall man all the 200 ships. When the ships have been manned, with 100 of them they shall reinforce Artemisium in Euboea, and with the other 100 they shall take station round Salamis and the rest of Attica and guard the country. In order that all Athenians are united to resist the Barbarian, those exiled for 10 years [i.e., those exiled by an ostracism] shall go to Salamis and stay there until the People [i.e., the *ecclesia* or assembly] decide about them. Those who have lost their citizen rights ...

Translated by Iain Spence.

Thucydides (ca. 462–after 404)

Thucydides lived through the Second Peloponnesian War (431–404). He served as an Athenian general in 424 but was exiled for 20 years for his failure to defend Amphipolis.

7. Thucydides 1.89.2. Sparta and Athens Diverge (479)

Introduction

This document describes the divergence of Greek aims after the Persian defeat at Mycale (479), the final major engagement of the Second Persian War (480–479). This was the start of the split between Sparta and her allies, who were not interested in campaigning against the Persians in the Hellespont and Asia Minor and the Athenians and their allies who wanted to exact further reparation from the Persians. The Athenian aims soon turned to freeing Ionian Greek states and the Aegean Islands from Persian control and increasing their own power—leading to the establishment of the

Delian League and the subsequent Athenian maritime empire.

Document

1.89 [2] When the Persians retreated from Europe, after their defeat by the Greeks both with ships and infantry and those who had fled with their ships to Mycale had been destroyed, Leotychidas, the king of the Spartans, who commanded the Greeks at Mycale, returned home taking with him the allies from the Peloponnese, and the Athenians and the allies from Ionia and the Hellespont who had already rebelled against the king of Persia stayed behind and besieged Sestos which the Persians held. They spent the winter there and took it once the barbarians had left, and after this sailed away from the Hellespont, each to their cities.

Translated by Iain Spence.

8. Thucydides 2.83–84. Phormio's Naval Victory (429/8)

Introduction

This document describes an early naval engagement in the Second Peloponnesian War (431–404). In 429/8, The Peloponnesians had managed to get 1,000 hoplites across the Gulf of Corinth to assist their allies in Acarnania and deployed a fleet and amphibious force to prevent the Acarnanians on the coast from helping those inland. At the same time as the Peloponnesian allies were decisively defeated after an impetuous advance on Stratus, Phormio, the Athenian admiral (strategos) decisively engaged the Peloponnesian fleet. Thucydides' description highlights the disparity between the experienced commanders and sailors of the Athenian fleet and their Peloponnesian opposition—as well as the advances in naval tactics since 480 (see Document 5).

Document

2.83 Meanwhile, the fleet from Corinth and the rest of the confederates in the Crissaeen Gulf, which was to have co-operated with Cnemus and stopped the coastal Acarnanians from joining their countrymen in the interior, was prevented from doing so around the same time as the battle at Stratus by having to fight with Phormio and the twenty Athenian vessels stationed at Naupactus. [2] For, as they coasted along out of the gulf, they

were watched by Phormio, who wanted to fight in open waters. [3] But the Corinthians and allies had started for Acarnania without any idea of fighting at sea, and with vessels more like troop transports. In addition, they never dreamed that the twenty Athenian ships would attempt to engage their forty-seven. However, while they were coasting along their own shore, the Athenians sailed along in line with them. When they tried to cross over from Patrae in Achaea to the mainland on the other side, on their way to Acarnania, they saw the Athenians coming out again from Chalcis and the river Evenus to meet them. They slipped from their moorings in the night, but were seen and eventually forced to fight in mid passage. [4] Each state contributing to the armament had its own general—the Corinthian commanders were Machaon, Isocrates, and Agatharchidas. [5] The Peloponnesians arranged their vessels in as large a circle as possible without leaving an opening, with the prows outside and the sterns in, placed all the small craft together inside it, and had their five best ships ready at a moment's notice to sail out and strengthen any point threatened by the enemy.

84. The Athenians, formed in single file, sailed round and round them and by continually brushing past and making as though they would attack at once forced them to contract their circle. However, they had been ordered by Phormio not to attack until he gave the signal. [2] He hoped the Peloponnesians would not keep their formation like infantry on land, but that the ships would foul each another and the small craft cause disorder. If the wind which usually rose towards morning blew from the gulf—in expectation of which he kept sailing around them—he was certain they would not remain steady for a moment. He also thought that he could attack when he wanted because his ships were better sailers, and that the most effective time to attack was when the wind rose. [3] When the wind did arise, the enemy's ships were crowded in a narrow space, and with the wind and the small craft dashing against them, quickly fell into confusion. The ships fouled each other and the shouting, swearing and struggling of the crews as they pushed each other off with poles drowned out the captains' and boatswains' orders. Lacking experience, they were unable to clear their oars in the rough water, preventing the helmsmen from properly controlling the ships. At this moment Phormio gave the signal, and the Athenians attacked. Sinking one of the admirals' ships first, they then destroyed all the others they came across. In the confusion, none of them

thought of resistance, but fled for Patrae and Dyme in Achaea. [4] The Athenians pursued and captured twelve ships, took most of the men out of them and sailed to Molycrium. After setting up a trophy on the promontory of Rhium and dedicating a ship to Poseidon, they returned to Naupactus. [5] As for the Peloponnesians, they immediately sailed with their surviving ships along the coast from Dyme and Patrae to Cyllene, the Eleian arsenal. Here Cnemus and the ships from Leucas that were to have joined them, also arrived after the battle of Stratus.

9. Thucydides 3.81–85. *Stasis* (Civil Strife) in Corcyra (427)

Introduction

In this document Thucydides comments on the stasis or civil strife in Corcyra in 427, during the early stages of the Second Peloponnesian War. In the sections preceding this (3.70–80) he provides a detailed description of Corcyra's slide into internal revolution and civil war and Athenian and Spartan interference in Corcyra's internal affairs. They did so to secure Corcyra's support in their war against each other. The passage is interesting not only for the details of internal strife but Thucydides' moralizing on the state of affairs in Greece and the moral decline brought about by the war (see also Documents 13 and 28).

Document

3.81. The Peloponnesians therefore at once set off with all speed by night for home, sailing close to shore. Hauling their ships across the Isthmus of Leucas, in order not to be seen rounding the point, they got away. [2] The Corcyraeans, realizing the Athenian fleet was approaching and the enemy fleet had gone, brought the Messenians from outside the walls into the town, and ordered the fleet which they had manned to sail round into the Hyllaic harbor. While it was doing so, they killed as many of their enemies as they could lay hands on and next, when they landed, killed those whom they had persuaded to go on board the ships. They then went to the sanctuary of Hera and persuaded about fifty of the suppliants to stand trial—and condemned them all to death. [3] When the main body of the

suppliants who had refused to stand trial saw what was happening, they killed each other in the temple; while some hanged themselves upon the trees, others killed themselves however they could. [4] During the seven days Eurymedon [the Athenian general] stayed there with his sixty ships, the Corcyraeans butchered those of their fellow-citizens whom they regarded as their enemies. Although the reason given was that they had attempted to overthrow the democracy, some were killed because of private enmity, others by their debtors because of the money they owed them. [5] Death raged in every form, and, as usually happens at such times, there was no extreme to which violence did not go. Fathers killed sons and suppliants were dragged from temples or killed in front of them; some were even walled up in the temple of Dionysus and died there.

82. So savage was the march of the revolution, and the impression which it made was even greater as it was one of the first to occur. Later on, one may say, the whole Greek world was convulsed; struggles were everywhere with the democratic leaders trying to bring in the Athenians, and the oligarchic leaders the Lacedaemonians. In peacetime there would have been no pretense nor desire to invite them in. But while these two were at war, while either faction in a city could make an alliance to hurt its enemies and advance its own cause, it was easy to bring in outsiders to overthrow a government. [2] Civil strife brought many terrible sufferings on the cities—which happen and always will happen, as long as human nature remains the same; although with varying degrees of severity, and with varying symptoms, according to the different sets of circumstance. In peace and prosperity, states and individuals conduct themselves better, because they are not confronted by dire necessity. But war removes the easy supply of daily needs, and proves a harsh master, reducing most men's characters to a level with their circumstances. [3] So, revolution broke out in city after city, and in the places where it arrived later, having heard what had been done elsewhere, the refinement of the activity was carried to even greater excess, as manifested in the cunning of the attacks and the atrocity of the reprisals. [4] Words had to change their ordinary meaning and take on whatever was now given them. Reckless audacity came to be considered the courage of a loyal ally; prudent hesitation, specious cowardice; moderation was held to hide unmanly weakness; the ability to see all sides of a question considered indecisive. Frantic violence marked a real man and plotting behind someone's back, legitimate self-defense. [5] The advocate of extreme

measures was always trustworthy; his opponent a man to be suspected. To succeed in a plot was to show intelligence, to detect a plot even more intelligent; but trying to avoid having to do either was disrupting your party, being scared of your adversaries. In short, it was equally commendable to strike first someone planning evil, or to denounce someone who planned no evil, [6] until even blood became a weaker bond than party, because party members were readier than those united by the former to dare everything without reservation. For such parties were not formed to enjoy the benefits of established laws but to gain power by their overthrow; and the confidence of party members in each other rested less on the gods' law than on partnership in crime. [7] Reasonable proposals from an adversary were not met with a generous reception by the stronger party but by jealous precautions. Revenge was considered more important than self-preservation. Oaths of reconciliation were only offered by two parties to meet an immediate difficulty and only held good so long as no other weapon was at hand. But, when the opportunity offered, the first person who seized it and caught his enemy off guard, thought this treacherous vengeance sweeter than an open one, because it was not only safer that way but success by treachery took the prize for superior intelligence. Indeed, men are generally readier to call rogues clever than simple men honest, and are proud of being the former and ashamed of being the latter. [8] The cause of all these evils was the lust for power arising from greed and ambition. Once they were engaged in the struggle the violence of parties sprang from these passions. The leaders in the cities, had admirable slogans: on one side the cry of "equal rights for the people," on the other "moderate aristocracy," but while pretending to act in the public interest they sought gain for themselves instead. In their struggle to win they recoiled from nothing, engaging in terrible actions—going to even greater lengths when it was a matter of revenge. They did not stop at what justice or the good of the state demanded, but made the party's whim of the moment their only standard, and were equally ready to use an unjust verdict or the authority of a strong arm to satisfy their current animosities. So, neither party honored piety, but the use of fine phrases to justify disgraceful actions was highly regarded. Meanwhile the moderate citizens perished between the two parties—either for not joining in the quarrel or because of envy they might escape.

83. In this way, every form of iniquity took root among the Greeks because of the civil strife. The simplicity which is the main mark of a noble

nature was laughed at and disappeared and society was divided into rival camps in which no man trusted the other. [2] To put an end to this, no promise could be relied upon, no oath could command respect—all parties considered a permanent solution hopeless and were focused on self-defense rather than trusting others. [3] In this contest the less intelligent were generally most successful. Worried by their own deficiencies and the intelligence of their opponents, they feared being beaten in debate or being surprised by the plots of their more versatile opponents, and immediately and boldly launched into action. [4] Their adversaries, on the other hand, arrogantly thinking that they would know in advance, and that it was unnecessary to secure by action what they could get through intelligence, often fell victim to their own lack of precaution.

84. Meanwhile, Corcyra provided the first examples of most of the crimes above—the revenge exacted when those who had never experienced fair treatment or indeed anything else but arrogance from their rulers finally triumphed; the wicked resolutions of those who wanted to escape from their accustomed poverty and eagerly desired their neighbors' goods; the savage and pitiless extremes of men motivated not by gain but by the ungovernable passion of party zeal. [2] In the confusion into which city-life was now thrown, human nature, always rebelling against the law now mastered it, and gladly showed itself uncontrolled in passion, above respect for justice, and the enemy of all things superior to it. If it had not been for the fatal power of envy, revenge would not have been set above religion, and profit above justice. [3] Indeed, in exacting revenge men too often begin the process of removing those general laws which everyone relies on for salvation in adversity, instead of preserving them against that day of danger when their protection may be needed.

85. While the Corcyraeans first displayed the passions of civil war, Eurymedon and the Athenian fleet sailed away. [2] After this, about five hundred Corcyraean exiles who had escaped took some forts on the mainland and gained control of the Corcyraean territory across the straits. They made this their base to plunder their countrymen on the island, and did so much damage that they caused a severe famine in the town. [3] They also sent envoys to Lacedaemon and Corinth to negotiate their restoration. But, meeting with no success, they later gathered boats and mercenaries and, about six hundred strong, crossed over to the island. Burning their boats, so they had no hope except to conquer the country, they went up to

Mount Istone, and fortifying themselves there, began to harass those in the city and gain control of the countryside.

10. Thucydides 5.10.2–10. The Battle of Amphipolis (422)

Introduction

Thucydides' account of the Peloponnesian War (431–404) was written during and shortly after the war. Thucydides did not like Cleon, but on this occasion Cleon seems to have blundered in the way he maneuvered his hoplites outside the enemy city of Amphipolis. His opponent, the Spartan Brasidas, was a much more experienced soldier who quickly seized the opportunity provided by the confusion in the Athenian ranks. Both generals were killed in the ensuing engagement. For the vulnerability of infantry to good cavalry, see also Documents 15 and 17.

Document

5.10. [2] Cleon, who had moved forward to reconnoiter, was informed that the entire enemy army was visible in the city and that the feet of many men and horses could be seen under the gates as if they intended to charge out. When he heard this he came forward to look. [3] After seeing it for himself, not wanting to fight until his reinforcements arrived—and judging he had time to withdraw—he gave the signal to do so. At the same time he gave orders that the left wing move towards Eion (which was the only possible way). [4] Thinking he had plenty of time, he personally wheeled the right wing around, exposing its unshielded side to the enemy.

[5] When Brasidas saw the Athenians were moving and the time was right he said to his men, and the other contingents, “These men will not hold their ground against us. That’s clear from the movement of their spears and heads—when troops are doing that they rarely withstand a charge. Someone open the gates as I ordered and let us charge out as fast as we can.” [6] He then sallied out of the palisade gates and the first gate in the long wall which was there at that time. Running at the double along the straight road, past where the trophy now stands as you go past the steepest part of the hill, he fell upon the Athenians. The center of the army, thrown into

panic by its own confusion and caught off-balance by the daring of his charge, was routed.

[7] Clearidas, as ordered, charged out from the Thracian gates in support and also attacked. The Athenians were thrown into confusion by the rapid and unexpected attack from two sides, [8] and the left wing, which had already got some way towards Eion straightaway broke and ran. When the left collapsed Brasidas attacked the right but was wounded; the Athenians did not know he had fallen as his men picked him up and carried him away. [9] The right wing, however, stood its ground better. Cleon himself, though, had no intention of staying and immediately fled—he was caught and killed by a Myrcinian peltast. The hoplites formed up on a hill and beat off two or three of Clearidas' attacks. They finally only gave way under a hail of javelins when surrounded by the Myrcinians, the Chalcidian cavalry, and the peltasts. [10] So, the whole Athenian army was now in flight—those who did not perish in the main engagement or at the hands of the Chalcidian cavalry and the peltasts only got away with difficulty and by various mountain tracks to Eion.

11. Thucydides 6.1. The Size of Sicily

Introduction

This document describes Athenian misconceptions about the size of Sicily which was one of the factors leading to their ultimately disastrous decision to try to take control of the island. As Thucydides notes, this drew them into a war just as large as the Second Peloponnesian War, which was currently suspended under the terms of the Peace of Nicias (421). An attack on Sicily therefore made the Athenians very vulnerable if the Peloponnesians chose to resume hostilities while the Athenians were engaged in Sicily. This is exactly what happened and Athens' involvement in Sicily played a major role in their ultimate loss of the Second Peloponnesian War (404).

Document

6.1. During the same winter, the Athenians decided to sail again against Sicily with a larger force than the one with Laches and Eurymedon [427–426] to subjugate it—if they were able. Many were ignorant of the size of

the island and the number of the inhabitants (both Greeks and barbarians) and that they were taking on themselves a war not much lesser than the one against the Peloponnesians. [2] For sailing around Sicily is not much under eight days by merchant ship and despite its size is separated from the mainland by around 20 stades [around 2.25 miles or 3.7 kilometers].

Translated by Iain Spence.

12. Thucydides 7.10–15. Nicias' Letter from Sicily (414/13)

Introduction

This document is a letter from the Nicias, the senior Athenian strategos (general) with the Athenian expeditionary force in Sicily in 414-413. The expedition was not going well, Nicias was ill and desperate either for reinforcements or the recall of the army. Worried at the possible reaction to his news, and that the messengers might not convey it properly, he sent a lengthy dispatch. As with the speeches in Thucydides, it is impossible to know how much of the text is accurate and how much is Thucydides' creation. He was in exile at the time and so could not have heard the letter read himself, but would have spoken to people who had. Thucydides outlined his own practice in recording speeches (1.22), and if he stuck to this the main thrust of the letter, if not its specific points, should reasonably represent what Nicias said in it. However, it clearly represents Thucydides' own views on the nature of the democracy. As a result of the letter the Athenians sent out a large number of reinforcements only for the expedition to suffer a catastrophic defeat. Nicias was captured and executed by the Syracusans.

Document

7.10. During the next winter [414/13], Nicias' messengers arrived in Athens, said what he had told them personally, answered any questions, and delivered the letter. The secretary (*grammateus*) of the city came forward and read to the Athenians as follows.

11. The previous events, Athenians, you know from many other dispatches. But now, having learned our current situation, it is the right time for you to deliberate. [2] For, after conquering the Syracusans against whom we were sent in most battles and building the walls we now occupy, Gylippus the Lacedaemonian arrived with an army from the Peloponnese

and from some Sicilian cities. He was defeated by us in the first battle but the next day we were overcome by many cavalry and javelin troops and withdrew inside the walls. [3] Now, therefore, we remain quiet, having stopped building the walls around the city because of the size of the enemy (we are unable to use our whole army as a part of the hoplite force has to be left behind to guard the walls). They have built a single cross wall against us, so it is no longer possible to complete our walls around the city unless the cross wall could be taken by a large army [see map of the Siege of Syracuse]. [4] So, we, who seem to be the besiegers are in fact besieged—as far as land operations go—we cannot advance far into the countryside because of the cavalry.

12. They have sent envoys to the Peloponnese for another army and Gylippus has gone to the Sicilian cities to persuade those who are currently neutral to join him in the war and, if he can, to bring from the others [his allies] land and naval forces. [2] For, as I have learned, they intend to attack our walls simultaneously with an army and from the sea with ships. [3] And none of you should think it surprising that it is also by sea because the enemy know that the condition of our fleet was at first good because of the dryness of the timber and the soundness of the crews but now the ships are rotten from already spending so great a time at sea and the crews are reduced. [4] This is because it is not possible to beach the ships to dry them out as the enemy's numbers are greater than ours and we constantly expect an attack. They are clearly visible exercising and the initiative lies with them; their capacity to dry out their ships exceeds ours.

13. Even with a greater number of ships and freed from the need to keep guard with all our ships, this is not possible for us. For if we were to diminish our guard at all, even briefly, we would not have the supplies—which are now only brought in past their city with great difficulty. [2] Because of this our crews have been depleted, and continue to be depleted, as the sailors are killed by the cavalry when foraging large distances for food, fuel, and water. Since we have lost our numerical superiority, our slaves desert. Those of our foreign sailors who were pressed ganged leave as soon as they can for their own cities and when those who were induced by high pay and thought they would get rich without fighting, see, contrary to expectation, the enemy naval force and other resources opposed to us, some leave by deserting to the enemy, others by whatever means they can (Sicily is a large place). Others, also, have bought Hyccaric slaves and persuaded

their ship's captains to take the slaves on board instead of them, thereby reducing the efficiency of the fleet.

14. I am writing to those who know that a crew's peak is brief and there are few sailors who can get a ship underway and row together in time. [2] But the greatest problem of all is that it is not possible for me as general to prevent these things—for you Athenians are by nature difficult to control and although the enemy can draw crews from everywhere, there is nowhere we can get additional crews from; we have to make do with the men we brought with us. This is because the cities that are now our allies, Naxos and Catana, are powerless. [3] If the enemy gains one more advantage the places in Italy which now feed us, seeing the difficulties we are in and that you are not sending help, will go over to them and the enemy will win the war without a battle by starving us out. [4] I could have written other more pleasing things to you than these, but none more useful if it is in fact necessary to see clearly conditions here in order to make a decision. At the same time, knowing your nature is to prefer to hear the most pleasant things but later to attach blame if any of them do not occur as promised, I considered it safer to record the truth.

15. And now, you ought to consider that, in relation to the original purpose for which we came, neither your soldiers nor your generals are to blame. Since all of Sicily has banded together and another army from the Peloponnese is expected to reinforce them and we here cannot hold out against even the current enemy force you must quickly decide whether to recall the expedition or to send out an expedition no smaller than before with a land force, fleet, and supplies just as large as the first—and someone to succeed me as I cannot stay because of an ongoing kidney disease. [2] I am worthy to claim this consideration from you because when I was in good health I did many good things for you while holding commands. Whatever you decide, implement it right at the start of summer and without delay as the enemy will get the Sicilian reinforcements quickly but those from the Peloponnese more slowly. Unless you turn your mind to it the former will get here before you and the latter will get past you, like before.

Translated by Iain Spence.

Xenophon (ca. 430– ca. 353)

Xenophon was an upper-class Athenian. Perhaps because of his association with the cavalry—an unpopular body with the restored democracy because of their support for the oligarchic government of the Thirty—and with Socrates, he left Athens to accompany Cyrus the Younger in his attempt to seize the Persian throne (401). He played a major role in the successful march home by the Ten Thousand and lived for many years in exile at Scillus, near Olympia. Xenophon was a student of philosophy, a thoughtful and experienced soldier, and had good contacts in Sparta and the Peloponnese.

13. Xenophon, *Hellenica* 2.3.47–56. The Death of Theramenes (404)

Introduction

Xenophon wrote the Hellenica in the 350s. This document describes the second half of the Athenian politician Theramenes' defense speech in front of the Boule, or Council of 500 in 404. At the end of the Peloponnesian War (431–404), with Spartan help the Athenian democracy had been overthrown by oligarchs. In theory the government was in the hands of a body called the "Three Thousand" but actually Athens was run by a narrow oligarchy, "The Thirty." Theramenes was a moderate member of the Thirty, but had fallen out with Critias, another member, over Critias' hardline measures. The preceding sections of the Hellenica (not included here) provide Critias' accusations against Theramenes, and the first part of Theramenes' response. The document is interesting for its insights into the extreme end of Athenian politics and the ways in which due process could be subverted and political enemies removed (see also Document 9).

Document

2.3. [47] "He [i.e. Critias] calls me "Buskin," [a large boot used by actors and which could fit either foot] because, he says, I try to fit both parties. But the man who pleases neither party—what in the name of the gods should we call him? For you [Critias] in the days of the democracy were regarded as the strongest hater of the people, and under the aristocracy you have now shown yourself the strongest hater of the upper classes. [48] But I, Critias, am forever at war with those who think there cannot be a good democracy until the slaves and those who would sell the state if they needed a drachma

share in the government, and I am equally forever an enemy of those who think that a good oligarchy cannot be established until they bring the state to the point of being ruled absolutely by a few men. However, to run the government along with those who have the means to serve, whether as cavalry or hoplites—I regarded this as the best way in the past and I have not changed my mind now. [49] And, Critias, if you can cite any case where I joined with either demagogues or tyrants and deprived good men of their citizenship, then speak. For if I am found guilty of doing this now or of ever having done it in the past, I admit that I justly deserve the supreme penalty—death.”

[50] With these words he stopped speaking and the Council’s applause clearly showed it favored him. Critias, realizing that if he allowed the Council to vote on the case, Theramenes would escape, thought this was unbearable. He briefly consulted with the Thirty, and then went out and ordered the men with the daggers to take their stand at the railing in full view of the Council. [51] Then he came in again and said: “Members of the Council, I consider it the duty of a true leader who sees that his friends are being deceived, not to allow it. I shall therefore do just that. Anyway, these men who have taken their stand here say that they will not let us free a man who is clearly harming the oligarchy. Now the new laws state that while nobody on the list of the Three Thousand can be put to death without your vote, the Thirty shall have power of life or death over those not on the list. I, therefore,” he said, “with the approval of all the Thirty strike this man Theramenes from the list. That being done,” he added, “we now condemn him to death.”

[52] When Theramenes heard this, he sprang to the altar and said: “And I, gentlemen,” said he, “ask only simple justice—that Critias not have the power to strike from the list either me or any one of you he might wish, but instead, in both your case and in mine that the judgment is made strictly in accordance with the law these men have made about those on the list. [53] And, by the gods,” he added, “I know only too well, that this altar will not help me at all, but I want to show that the Thirty here are not only most unjust toward men, but also most impious toward the gods. But I am surprised at you,” he said, “gentlemen of the aristocracy, that you are not going to defend yourselves, especially when you know that it is just as easy to strike any of your names off as it is mine.”

[54] At this point the herald of the Thirty ordered the Eleven [the group

in charge of condemned prisoners and their execution] to seize Theramenes; and when they came in with their attendants and led by Satyrus, the most audacious and shameless of them, Critias said: “We hand this man Theramenes over to you, condemned according to the law. And you, the Eleven, take him and lead him to the proper place and do what follows next.”

[55] When Critias had said this, Satyrus, helped by his attendants, dragged Theramenes away from the altar. And Theramenes, as was natural, called upon gods and men to witness what was going on. But the council members kept quiet, seeing that the men armed with daggers at the rail were of the same sort as Satyrus and that the space in front of the council chamber was filled with guards.

[56] So the Eleven led Theramenes away through the market place, while he proclaimed in a very loud voice the wrongs he was suffering. One saying of his that is reported was this: when Satyrus told him that if he did not keep quiet, he would suffer for it, he asked: “But if I do keep quiet, won’t I still suffer?” And when, forced to die, he had drunk the hemlock, they said that he threw out the last drops, like a man playing *kottabos*, [a game where you attempted to flick the wine dregs in a cup into a bowl and wished a loved one good health] and exclaimed: “Here’s to the health of my beloved Critias.” Now I know that these sayings are not really worth recording; still, I think it admirable in the man that with death near at hand, he did not lose the spirit of playfulness nor the ability to think.

14. Xenophon, *Anabasis* 2.6.1–15. Clearchus the Spartan (401)

Introduction

Xenophon probably wrote the Anabasis in the 360s. It recounts the history of the “Ten Thousand,” a force of Greek mercenaries employed by Cyrus the Younger to help overthrow his brother, the Great King of Persia. Xenophon was an eyewitness to their epic return home after Cyrus’ death. This document describes Clearchus, the senior mercenary general, after his execution by the Persians. Xenophon’s description is interesting in his

assessment of the leadership qualities (and deficiencies) of a professional soldier who in modern terms may have been suffering from PTSD.

Document

2.6. The generals, then, having been seized in this way, were taken to the King and beheaded. One of them, Clearchus, by common agreement of all who knew him personally, was a man who was both suited for war and extremely fond of war. [2] For, in the first place, as long as the Lacedaemonians were at war with the Athenians, he stayed with them but when peace came, he persuaded his state that the Thracians were harming the Greeks, and, after gaining his point as best he could with the ephors, set sail to make war on those Thracians living beyond the Chersonese and Perinthus. [3] When, however, for some reason the ephors changed their minds and, after he had already left, tried to turn him back from the Isthmus of Corinth, at that point he refused to obey and sailed off to the Hellespont. [4] As a result he was condemned to death by the Spartan authorities for disobeying orders. Now an exile, he came to Cyrus, and the arguments he used to persuade Cyrus are recorded elsewhere [they do not appear in the *Anabasis*—Xenophon may have intended to add them later and did not]; at any rate, Cyrus gave him 10,000 darics, [5] and he, on getting the money, did not turn to comfortable idleness but used it to recruit an army and made war upon the Thracians. He defeated them in battle and from that time on plundered them in every way, keeping up the war until Cyrus wanted his army. Clearchus then returned, to make war alongside Cyrus.

[6] Such conduct as this, in my opinion, reveals a man fond of war. When he might enjoy peace without dishonor or harm, he chooses war; when he might live in idleness, he prefers the toil of war; when he might keep his money without risk, he chooses to diminish it by carrying on war. Indeed, just as one might spend money on a lover or any other pleasure, Clearchus wanted to spend it on war. [7] He was just this sort of lover of war and, again, seemed to be fitted for it. He was fond of danger, ready to lead his men against the enemy by day or night, and, as everyone who was with him anywhere agrees, he kept a cool head in dangerous situations. [8] He was also said to be fitted for command—so far as this is possible for a man of such a disposition. He was highly proficient, if ever a man was, in planning how to supply his army and in actually achieving this. He was also very proficient in impressing on those with him that Clearchus must be

obeyed. [9] He achieved this by being severe; for he was gloomy in appearance, had a harsh voice, and used to punish severely, sometimes in anger, so that he would also sometimes be sorry afterwards. [10] Yet he also punished on principle, for he believed there was no good in an army without punishment; in fact, he used to say, it was reported, that a soldier must fear his commander more than the enemy if he was to perform guard duty, refrain from harming friends, or without hesitation go into action against the enemy. [11] In dangerous situations, therefore, the troops were ready to obey him implicitly and would choose no other commander. For, they said that at such times his gloominess appeared to be brightness, and his severity seemed to be resolution against the enemy, so that it no longer seemed severity but meant safety. [12] But when they had got past the danger and could go off to serve under another commander, many would desert him. For there was no attractiveness about him, but he was always severe and rough, so that the soldiers had the same feeling towards him that boys have towards a schoolmaster. [13] For this reason, he never had followers there from friendship and good-will, but only those who been placed under his command by a government or were there from poverty or some other necessity. These gave him implicit obedience. [14] Once they began to defeat the enemy in his service, there were important reasons for his soldiers' efficiency—they were confident in the face of the enemy and their fear of his punishments kept them in a good state of discipline. [15] This is what he was like as a commander, but it was said he did not particularly like being commanded by others. He was about fifty years old at the time of his death.

15. Xenophon, *Hellenica* 4.8.17–19. Spartan Incompetence in Asia Minor (ca. 390)

Introduction

Xenophon, an experienced soldier and cavalryman, familiar with both Asia Minor and the Spartans, wrote the Hellenica in the 350s. The document describes the conflict between Struthas, the Persian satrap in western Asia

Minor, ca. 390 and the Spartans. It demonstrates that even Spartans could be careless and unprofessional—as well as how vulnerable infantry out of formation could be to good quality cavalry (see also Document 17).

Document

4.8. [17] When Tiribazus had joined him inland, the King sent Struthas to command on the coast. Struthas, however, remembered the damage Agesilaus had done to the King's territory and strongly favored the Athenians and their allies. When the Spartans saw that Struthas [Persian satrap in western Asia Minor, c. 390] was hostile to their side and friendly toward the Athenians, they sent out Thibron to make war on him. He sailed over to Asia Minor and operating from Ephesus and the cities on the Plain of the Maeander, Priene, Leucophrys, and Achilleum, he plundered property and drove off cattle from the Persian King's territory.

[18] As time went on, Struthas observed that time and time again Thibron made counter-attacks in an undisciplined and over-confident fashion. Struthas sent his cavalry into the plain and ordered them to ride over the plain in wild raids and to sweep up anything that they could. At the time Thibron happened to be relaxing in his tent after breakfast with Thersander the pipe-player. Thersander was not only a first-rate pipe player but he also cultivated manly prowess, since he was a partisan of Sparta. When Struthas saw that the first Greeks making a counter-attack were an undisciplined handful, he suddenly broke cover with a large cavalry force in tight formation.

[19] The first they killed were Thibron and Thersander. After these fell, the Persians routed the rest of the Greek army. In the pursuit they cut down a large number of Greeks. Some managed to escape to friendly cities, the greater part of these only because they had learnt of the counter-attack when it was too late. The fact is that Thibron, as on this occasion, often made a counter-attack without giving out any orders.

Translated by Douglas Kelly.

16. Xenophon, *Hellenica* 6.4.3–16. The Battle of Leuctra (371)

Introduction

Xenophon wrote the Hellenica in the 350s. This document describes the pivotal battle of Leuctra, which ended Spartan military domination in Greece and led to Theban hegemony. Although he glosses over detail, Xenophon's description of the battle is the best surviving account, and the only one from a contemporary. The Spartans had invaded Boeotia with 10,000 infantry and 1,000 cavalry and outnumbered the Boeotian opposition, who perhaps numbered 6,000 hoplites. Although not entirely clear from Xenophon's account, the Theban commander, Epaminondas, advanced obliquely, with his best troops, unusually, on the left wing and in a deeper than usual formation. His plan, to strike hard at the Spartan line where the king was located worked and demonstrated the increased sophistication of Theban hoplite tactics. Xenophon's account is very much from the Spartan perspective and at several points attempts to salvage whatever comfort is possible from the disaster.

Document

6.4. [3] Now Cleombrotus did not enter Boeotia from Phocis at the point where the Thebans expected him to enter and where they were keeping guard at a narrow pass, but going via Thisbae along a mountainous and unexpected route, he arrived at Creusis, captured its wall, and took twelve triremes belonging to the Thebans. [4] After doing this and marching inland from the coast, he camped at Leuctra, in the territory of Thespieae. The Thebans were camped on the opposite hill not very far away, with no allies except the Boeotians. Then Cleombrotus' friends went to him and said: [5] "Cleombrotus, if you let the Thebans escape without a battle, you risk suffering the most extreme penalty from the state. For they will remember and hold against you not only the time when you reached Cynoscephalae but did not lay waste any Theban territory, but also the later time when you were beaten back from entering—although Agesilaus always got through via Cithaeron. So, if you really have a care for yourself or want to see your fatherland again, you must lead against these men." While his friends said this, his enemies said: "Now is the time when the man will make it clear whether, as rumor has it, he really favors the Thebans."

[6] Hearing this, then, Cleombrotus was spurred on to fight a battle. On the other side, the leaders of the Thebans calculated that if they did not fight, the cities round them would revolt and they would themselves be besieged and, in addition, if the people of Thebes were cut off from supplies,

there was a risk that the city itself would turn against them. And since many of them had been in exile before, they reckoned it was better to die fighting than be exiled again. [7] Besides this, they were also rather encouraged by the oracle which stated that the Lacedaemonians would be defeated at the place of the monument to the virgins, who it is said killed themselves because they had been raped by some Lacedaemonians. So, the Thebans decorated this monument before the battle. In addition, reports came to them from the city that the doors of all the temples were opening by themselves, and the priestesses were saying that the gods were clearly indicating victory. The messengers also reported that the weapons had disappeared from the Heracleium [Temple of Heracles], showing that Heracles had gone out to the battle. Some, certainly, say that all these things were tricks devised by the leaders. [8] But in the battle, at any rate, everything went badly for the Lacedaemonians, while on the other side everything went well, including luck.

For it was after the morning meal that Cleombrotus held his last command meeting about the battle. They had been drinking a little at midday and it was said that the wine had somewhat excited them. [9] Again, when both sides were arming themselves and it was already clear there would be a battle, in the first place, those who had provided the market, some baggage-carriers, and some who did not wish to fight began to withdraw from the Boeotian army. The Lacedaemonian mercenaries under Hieron, the Phocian peltasts, and, from among the horsemen, the Heracleots and Phliasians circled around and fell upon them, turning them and chasing them back to the Boeotian camp. In this way they made the Boeotian army much larger and more densely massed than it had been before. [10] In the second place, as the ground between the armies was a plain, the Lacedaemonians posted their horsemen in front of their phalanx, and the Thebans did the same. Now the cavalry of the Thebans was in good training as a result of the war against the Orchomenians and the war against the Thespians, while the Lacedaemonian cavalry at that time was exceedingly poor. [11] For the richest men kept the horses, and it was only on mobilization that the appointed trooper reported for duty. He would then get his horse and those weapons and equipment provided to him, and straightaway deploy. As for the men, it was those who were least fit and least ambitious who served in the cavalry. [12] Such, then, was the cavalry on either side. Coming now to the infantry, it was said that the

Lacedaemonians led each *enomotia* [half-company] three files abreast, so that the phalanx was not more than twelve men deep. The Thebans, however, were massed at least fifty shields deep, calculating that if they defeated the part of the army around the king, the rest of it would be easy to overcome.

[13] Now Cleombrotus began to lead his army against the enemy, but first—and even before the troops under him realized he was advancing—the cavalry had already engaged and the Lacedaemonian horse quickly routed. In their flight they had fallen foul of their own hoplites, and, in addition, the Theban *lochoi* [companies] were now charging upon them. Nevertheless, that Cleombrotus and those around him were at first winning in the battle is clearly indicated by the fact that they could not have taken him up and carried him off still alive if those who were fighting in front of him had not held the advantage at that time. [14] But when Deinon, the polemarch, Sphodrias, one of the king's tent-companions, and his son Cleonymus, had been killed, then the *Hippeis* [royal bodyguard], those called the “aides of the polemarch,” and the others fell back under the pressure of the Theban mass, and those on the left wing of the Lacedaemonians saw the right wing being pushed back and gave way.

Despite the fact that they had been defeated and many had fallen, after they had crossed the trench which happened to be in front of their camp they grounded their arms at the spot from which they had set out. However, the camp was not on entirely level ground, but on the slope of a hill. After this disaster, some of the Lacedaemonians, finding it unbearable, said that they ought to stop the enemy from setting up a trophy and try to recover the bodies of the dead, not by a truce, but by fighting. [15] The polemarchs, however, saw that almost a thousand of all the Lacedaemonians there had been killed and further, that among the seven hundred or so Spartiates there, about four hundred had fallen. Seeing, too, that none of the allies had any appetite for fighting, while some were even pleased at what had happened, they gathered together the most important personages and deliberated about what they should do. And as all thought it best to recover the bodies of the dead by a truce, they finally sent a herald to ask for one. After this, then, the Thebans set up a trophy and gave back the bodies under a truce.

[16] After these things had happened, the messenger sent to report the calamity to Lacedaemon arrived there on the last day of the festival of the

Gymnopaediae, when the chorus of men was in the theatre. When the ephors heard of the disaster, they were, as I consider inevitable, indeed distressed, but did not withdraw the chorus, allowing it to finish its performance. Further, although they gave the names of the dead to their relatives, they ordered to the women not to make any outcry, but to suffer the calamity in silence. And on the following day you could see those whose relatives had been killed going about in public with bright and cheerful faces, while you saw few of those whose relatives had been reported as living, and these were walking about gloomy and downcast.

17. Xenophon, *Hellenica* 7.1.21. Sicilian Cavalry in Greece (369)

Introduction

Xenophon wrote the Hellenica in the 350s. This document describes an engagement in 369 between Sicilian cavalry supporting Sparta and a Boeotian force which had invaded the Peloponnese. It illustrates the effectiveness of good quality cavalry operating against heavy infantry—the combination of missiles and the mobility of the horse were very difficult for hoplites to counter. Similar tactics could also be used by light infantry against hoplites, as at Lechaeum in 390 (Xenophon, Hellenica 4.5.11–18)—see also Documents 10 and 15.

Document

7.1 [21] As few as they were, Dionysius' cavalymen scattered here and there, and riding alongside the enemy charged and hurled their javelins at them. When the enemy charged out at them they would retire and then turn about and hurl their javelins. During this procedure they would dismount from their horses and take a break and if anyone charged out at them while they were dismounted they would leap on their horses and retire without any trouble. In addition, if any pursued them far from the army, when these retired they would press upon them and wreak havoc with their javelins. So, they forced the whole army to advance or retreat as they themselves

wished.

Translated by Iain Spence.

Demosthenes (ca. 384–322)

Demosthenes was a fourth-century Athenian orator and statesman who consistently opposed Philip II of Macedon. Arguably the most accomplished orator of his time, Demosthenes committed suicide in 322 when the Greeks lost the Lamian War, and their opportunity to free themselves from Alexander the Great's control.

18. Demosthenes 54 (*Against Conon*) 3–5. Indiscipline in an Athenian Garrison (ca. 355–340)

Introduction

This passage is part of one of Demosthenes' forensic, or legal, speeches. Athenian legal procedure was for an individual to deliver their own case in court, but this could be written for them by professional orators. In this instance Demosthenes wrote the speech for Ariston to deliver in his prosecution of Conon and his sons for an assault which he claims nearly killed him. Although perhaps exaggerated to gain sympathy (Athenian law courts did not operate to modern standards of evidence or include cross-examination), the passage gives a good example of indiscipline among nonprofessional soldiers on garrison duty.

Document

3. Two years ago I went out to Panactum, where we had been ordered to do garrison duty. So, the sons of Conon were camped near to us—I wish it was not so. For the enmity and quarrels which affected us originated there and the causes of these you shall hear. These men were accustomed to drink the whole of each and every day as soon as they had finished lunch and they continued to do so as long as we were in the garrison. But we behaved ourselves there, outside the city, just as we are accustomed to do here.

4. So, whatever time the others were dining, these men were already drunkenly abusive, generally toward our attendant slaves but ultimately toward us too. For, after accusing the slaves of blackening them with smoke

while preparing the meal or of abusing them—or whatever else they might fancy, they used to beat them and empty their chamber pots on them and urinate on them and desist from no insult or violent action whatever. Seeing this we were annoyed and tried to protect ourselves, but as they mocked us and didn't stop, the whole mess together—not just me alone—went to the general and told him of the matter.

5. After he had abused and censured them not only for their brutal treatment of us but also over their entire behavior in the camp, they were so far short of being ashamed or desisting that no sooner had night fallen they immediately burst in on us, at first using verbal abuse and then laying blows on me. They made such a shrieking and uproar around the tent that the generals and taxiarchs and some of the soldiers came, who prevented us from suffering, or doing ourselves, anything irreparable, being drunkenly mistreated by these men.

19. Demosthenes 9 (*Third Philippic*) 48–50. Reasons for Philip II's Success (342)

Introduction

This passage is part of one of Demosthenes' political speeches, contrasting lethargic Athenian military action with Philip II's energetic campaigning. One of the reasons for Philip's success was his departure from the traditional pattern of hoplite warfare, which involved an annual invasion at the time the crops were ripening and then a return home and inaction over winter. This tempo was driven by the fact that the hoplite armies of Greek cities were part-time. Philip's creation of an army that was virtually professional allowed him to campaign year-round.

Document

48. For, firstly, I am told, that in those days the Lacedaemonians [Spartans] just like everyone else would spend four or five months in the summer attacking and ravaging a territory with hoplites and citizen troops and then go home again. They were so old fashioned, or rather such good citizens, that they never used money to buy any advantage from another but their warfare was legitimate and transparent.

49. But now you certainly see that most disasters result from traitors and none from pitched battles. You hear of Philip marching wherever he wants, not with a hoplite phalanx but with *psiloi* (light infantry), cavalry, archers, mercenaries, and other such types of troops.

50. Whenever with these advantages he falls upon some people suffering internal strife and through distrust nobody comes out to defend their land, he brings up his engines and besieges them. I don't need to tell you that Philip makes no distinction between winter and summer and chooses no season for a pause in military exercises.

Pergamene Inscription (ca. 263–241)

20. *Orientis Graeci Inscriptiones Selectae* 1.266. An Agreement between Eumenes I of Pergamum and His Mercenaries (ca. 263–241)

Introduction

*This document is an inscription from Pergamum dating to around 263–241. Although the meaning of parts of it is disputed, it appears to be a formal agreement between Eumenes I of Pergamum and a group of mercenaries in north Pergamum who had been in revolt. Although mercenaries were costly, Eumenes had hired a large mercenary force and used them first to defeat Antiochus I Soter of Syria at Sardis in 262 and then expand his own territory into the nearby coastal areas and Mount Ida, which had important pitch and timber resources required for shipbuilding. The document is an important one for outlining the type of contract existing between mercenaries and Hellenistic monarchs—and what was important to both parties to the agreement. Although there were regional variations in measurement, a medimnus was generally about 60 liters or 15 US gallons and a metretes was generally about 39.4 liters or 10.4 US gallons. See also the entry *Contracts, Military*.*

Document

Demands which Eumenes son of Philetaerus granted to the soldiers at

Philetaerea and Attalea:

Payment of the price for grain at four drachmas a *medimnus*; and wine at four drachmas a *metretes*.

Regarding the year: to ensure that it may be reckoned as 10 months and that he will not reckon any intercalary month.

Regarding those who have rendered the appropriate number and become out-of-service: to ensure that they receive pay for the time previously employed.

Regarding the matter of orphans: to ensure that the next of kin or any person to whom one bequeaths it receives it.

Regarding taxes: to ensure that the immunity from taxes that applied in the forty-fourth year is in force. If any man becomes out-of-service, or makes an application, he is to be discharged and be tax-exempt when he exports his goods and chattels.

Regarding the pay, which he agreed to for a four-month period: to ensure that the agreed amount is paid and it is not to be reckoned against the pay.

Regarding the White Poplars: to ensure that they receive their grain for the period in which they receive their crowns.

The oath and the agreement is to be inscribed on four stone pillars, and one is to be set up at Pergamum in the sanctuary of Athena, one at Gryneum, one on Delos, and one at Mytilene in the Asclepeum.

The oath that the following swore: Paramonus, the officers and the soldiers under their command at Philetaerea below Mount Ida; Polylaus and the officers and soldiers under his command at Attalea; Attinas the cavalry commander and the cavalrymen under his command; Homoloichus and the Trallians under his command.

"I swear by Zeus, Earth, Sun, Poseidon, Demeter, Ares, Athena Area, the Tauropolus, and all the other gods and goddesses. I am reconciled on the best basis with Eumenes son of Philetaerus, I shall show good will to him and his family; I shall not plot against Eumenes son of Philetaerus or bear arms against him; I shall not desert Eumenes but shall fight on his behalf and on behalf of his interests, throughout life and at the point of death. I shall render service in general with good will and without shirking, with full commitment to the utmost of my ability. If I become aware of anyone plotting against Eumenes son of Philetaerus or performing any action contrary to him or his interests, I shall not tolerate this and I shall give

information immediately, or as soon as possible, about the person engaged in any action of this kind, to Eumenes son of Philetaerus or to any person who I judge will report this to him promptly. I shall guard anything that I receive from him, city, fortress, ships, or valuables, or anything else that is handed over to me. I shall restore it properly and fairly to Eumenes son of Philetaerus or to any person that he may designate, so long as he is acting in accordance with the agreement.

I shall not accept any letter from his enemies or admit any envoy from them nor shall I send any dispatch to them. If someone brings anything to me, I will bring and deliver the letters under seal, and the person who brought them, as quickly as I am able, to Eumenes or to any person who I judge will report them promptly to him.

I will not engage in any sharp practice whatsoever regarding the oath by any subtlety or contrivance. I release from their oath Eumenes son of Attalus and those who took the oath along with him, now that the agreement has been carried out.

If I keep my oath and abide in goodwill toward Eumenes son of Philetaerus, may it go well for me personally and for mine. If I commit perjury and violate the agreement in any way, may I personally and my family perish from the face of the earth.”

Oath of Eumenes: “I swear by Zeus, Earth, Sun, Poseidon, Demeter, Ares, Athena Area, the Tauropolus and all the other gods and goddesses. I shall show goodwill to Paramonus, the officers and the others on the payroll: to those stationed in the military district of Philetaerea under Mount Ida under the command of Paramonus; to Arces and the garrison troops under his command, to Philonides and the discharged soldiers who have taken part in this oath; to these and their families, and also to Polylaus and the officers and soldiers stationed under his command at Attalea, infantry, cavalry, and Trallians all alike. So long as they continue to serve with me, I shall not plot against them nor shall anyone else on my behalf. I shall not betray any of them or anything belonging to them to any enemy, neither ... of them nor those elected by their assembly, not by means or any contrivance, nor will I bear arms against

Translated by Douglas Kelly.

Polybius (ca. 200–118)

Polybius was born into a prominent family in Megalopolis ca. 200. He had extensive military experience, including serving with Publius Cornelius Scipio Aemilianus in the Third Punic War, and had good contacts in the upper echelons of Roman society. His *Histories* cover Greece and Rome's early foreign wars from 264 to 146.

21. Polybius 12.17–22 Callisthenes' Errors about the Battle of Issus (333)

Introduction

This document criticizes the historian Callisthenes' account of Alexander the Great's victory over Darius at Issus (November 333). Callisthenes was a historian not a soldier but he was present at the battle. Polybius criticizes Callisthenes on the basis of internal inconsistencies and, according to Polybius, the physical impossibility of fitting the armies in the formations described into the space and terrain described. The passage sheds further light on the operation of the Macedonian phalanx, this time also including the other parts of the army—and the difficulties even near contemporaries had in analyzing earlier military history. Callisthenes' history of Alexander's campaigns does not survive. See also Documents 26 and 27.

Document

12.17. In order that we may not appear to insist arbitrarily on implicit belief in my criticism of such famous writers, we shall take one battle and a very famous one, a battle which took place not very long ago and, most importantly, one at which Callisthenes himself was present. [2] I refer to Alexander's battle with Darius in Cilicia. Callisthenes tells us that Alexander had already crossed the gap and the so-called Cilician Gates, while Darius had marched through the pass known as the Gates of Amanus and had descended with his army into Cilicia. [3] On learning from the locals that Alexander was advancing in the direction of Syria he followed him up, and when he approached the pass, encamped on the banks of the river Pinarus. [4] The distance, he says, from the sea to the foot of the hills is not more than 14 stades [about 1.6 miles or 2.5 kilometers] and [5] the river runs obliquely across this space, with gaps in its banks just where it

issues from the mountains, but in its whole course through the plain, as far as the sea, it passes between steep hills difficult to climb. [6] Having given this sketch of the country, he tells us that Darius and his generals, when Alexander turned and marched back to meet them, decided to draw up the whole phalanx in the camp itself in its original position, protected by the river, since it ran close past the camp. [7] After this he says they drew up the cavalry along the sea-shore, the mercenaries next to them beside the river, and the peltasts next to the mercenaries who stretched as far as the mountains.

18. It is difficult to understand how they posted all these troops in front of the phalanx, considering that the river ran close past the camp, especially in view of their numbers. [2] For, as Callisthenes himself says, there were 30,000 cavalry and 30,000 mercenaries, and it is easy to calculate how much space was needed for them. [3] To be really useful cavalry should not be drawn up more than eight deep, and between each *ile* [squadron] there must be a space equal in length to the front of a squadron so there is no difficulty in wheeling and facing about. [4] Therefore, a stade will hold 800 cavalry, 10 stades 8,000, and 4 stades 3,200, so that 11,200 cavalry would fill a space of 14 stades. [5] If the whole force of 30,000 were drawn up, the cavalry alone would almost form three such bodies [i.e., of 11,200], one placed close behind the other. [6] Where, then, were the mercenaries posted, unless indeed they were drawn up behind the cavalry? But he tells us this was not so, as they were the first to meet the Macedonian attack. [7] It is therefore necessary to understand that the cavalry occupied that half of the space that was nearest the sea and the mercenaries the half nearest the hills. [8] From this it is easy to calculate the depth of the cavalry and how far away from the camp the river must have been. [9] After this he tells us that on the approach of the enemy, Darius, who was half way down the line, called the mercenaries himself to come to him from the wing. It is difficult to see what he means by this. [10] For the mercenary and cavalry contingents must have joined just in the middle of the field, so that how, why, and where could Darius, who was actually among the mercenaries, call them to come to him? [11] Lastly, he says that the cavalry from the right wing advanced and attacked Alexander's cavalry, who received their charge bravely and delivering a counter charge fought stubbornly. [12] He forgets that there was a river between them and such a river as he has just described.

19 His statements about Alexander are very similar. He says that when he crossed to Asia he had 40,000 infantry and 4,500 cavalry, [2] and that when he was on the point of invading Cilicia he was joined by a further force of 5,000 infantry and 800 cavalry. [3] Suppose we deduct from this total 3,000 infantry and 300 cavalry, a liberal allowance for those absent on other tasks, there still remain 42,000 infantry and 5,000 cavalry. [4] Assuming these numbers, he tells us that when Alexander heard the news of Darius' arrival in Cilicia he was 100 stades away [about 11.4 miles or 18 kilometers] and had already crossed the pass. [5] He therefore turned and marched back through the pass with the phalanx in front, followed by the cavalry, and last of all the baggage-train. [6] Immediately he entered the open country he re-formed his men, passing to all the word of command to form into phalanx, making it at first 32 deep, afterwards changing it to 16 deep, and finally as he approached the enemy to 8 deep. [7] These statements are even more absurd than his former ones. For with the proper intervals for marching order a stade [about 200 yards or 180 meters], when the men are 16 deep, will hold 1,600, each man being at a distance of 6 feet [about 2 meters] from the next. [8] It is evident, then, that 10 stades [about 2,000 yards or 1,800 meters] will hold 16,000 men and 20 stades twice as many. [9] From all this it is quite plain that when Alexander made his army 16 deep the line necessarily extended for 20 stades, and this left all the cavalry and 10,000 of the infantry over.

20 After this he says that Alexander led on his army in an extended line, being then at a distance of about 40 stades [about 4.5 miles or 7.2 kilometers] from the enemy. [2] It is difficult to conceive anything more absurd than this. Where, especially in Cilicia, could one find a stretch of ground where a phalanx with its long spears could advance for 40 stades in a line 20 stades long? [3] Indeed, the obstacles to such a formation and such a movement are so many that it would be difficult to number them all. A single one, mentioned by Callisthenes himself, is enough to convince us of its impossibility. [4] For he states that the torrents flowing down the mountains have formed so many ravines in the plain that most of the Persians in their flight perished in such fissures. [5]

By Zeus, it may be said, Alexander wished to be prepared for the appearance of the enemy! [6] But, what can be less prepared than a phalanx advancing in line broken and disunited? How much easier would it be to move from proper marching-order into order of battle than to straighten out

and prepare for action on thickly wooded and fissured ground a broken line with numerous gaps in it? [7] It would, therefore, have been considerably better to form a proper double or quadruple phalanx, for which enough marching room could have been found, and which could quickly and easily be brought into battle formation—since he was able to get from his scouts enough warning of the enemy's approach. [8] But, other things apart, Alexander did not even, according to Callisthenes, send his cavalry on in front when advancing in line over flat ground, but apparently placed them alongside the infantry.

21 But here is the greatest of all his mistakes. He tells us that Alexander, on approaching the enemy, made his line 8 deep. [2] It is evident, then, that now the total length of the line must have been 40 stades [about 4.5 miles or 7.2 kilometers]. [3] And even if they closed up so that, as described by Homer, they actually jostled each other, still the front must have extended over 20 stades [about 2.25 miles or 3.6 kilometers]. [4] But he tells us that there was only a space of less than 14 stades [about 1.6 miles or 2.5 kilometers], [5] and as half of the cavalry were on the left near the sea and half on the right, the room available for the infantry is still further reduced Add to this that the whole line must have kept at a considerable distance from the mountains to reduce the risk of attack by those of the enemy who held the foot-hills. [6.] We know in fact he drew up part of his force in a crescent formation to oppose these men....

I omit to reckon here also the ten thousand infantry more than his purpose required. [7] So the consequence is that the length of the line must have been, according to Callisthenes himself, 11 stades [about 2,200 yards or 1,980 meters] at the most, and in this space 32,000 men must have stood closely packed and 30 deep, whereas he tells us that in the battle they were 8 deep. [8] Now for such mistakes we can admit no excuse. [9] For when the actual facts show a thing to be impossible we are instantly convinced that it is so. [10] So, when a writer gives definitely, as in this case, the distance from man to man, the total area of the ground, and the number of men, it is perfectly inexcusable for him to make false statements.

22 It would take too long to mention all the other absurdities of his narrative, and it is enough to point out a few. [2] He tells us that Alexander in drawing up his army was very keen to fight opposite Darius in person, and that Darius also at first wished the same, but afterwards changed his mind. [3] But he tells us absolutely nothing as to how they informed each

other where they were stationed in their own line, or where Darius finally went when he changed position. [4] And how, we ask, did a phalanx of heavy-armed men climb the bank of the river which was steep and overgrown with brambles? [5] This, too, is inexplicable. Such an absurdity cannot be attributed to Alexander, as it is universally recognized that from his childhood he was well versed and trained in the art of war. [6] We should rather attribute it to the writer who is so ignorant as to be unable to distinguish the possible from the impossible in such matters. [7] Let these words suffice for Ephorus and Callisthenes.

22. Polybius 4.57–58. A Failed Night Attack: Aegyrium (219)

Introduction

This extract from his Histories describes a failed Aetolian night attack on Aegyrium in Achaia in 219. It illustrates the difficulty and confusion of ancient Greek night operations, as well as the problems caused by a lack of discipline or professionalism that could be a feature of nonstanding armies. Another good example of a failed night attack (in Sicily in 413) is given in Thucydides 7.43–44.

Document

4.57. [2] Alexander and Dorimachus formed a plan against Aegyrium. They collected 1,200 Aetolians at Oeanthia in Aetolia, which is situated opposite Aegyrium, provided boats for them and waited for the right weather for the attack. [3] There was an Aetolian deserter who had spent a long time in Aegyrium and had observed that the guards on the gate at Aegyrium were heavy-drinkers and negligent in their duties. [4] He made the risky crossing a number of times and urged Dorimachus' men to make the attempt since they were old hands at this kind of enterprise.

[5] Aegyrium is located in the Peloponnese on the Corinthian Gulf between Aegium and Sicyon and is on steep hill-site difficult of access. It faces Parnassus and its region and on the other side of the Gulf and is almost 7 stades [a mile or 1.6 kilometers] from the sea. [6] When the weather turned right for Dorimachus, they sailed across and anchored in the

night at the river that flows past the town. [7] Alexander and Dorimachus, together with Archidamus son of Pantaleon, advanced on the town with the Aetolian main body along the road leading to Aegium. [8] The Aetolian deserter took 20 men especially suited for this kind of action and by avoiding pathways made his way up the cliffs ahead of the main body thanks to his knowledge of the ground. He got into the city though a drain and found the gate detail asleep. [9] He at once killed them in their beds. He chopped through the bars on the gate with axes and opened the gates to the Aetolians.

[10] The Aetolians stormed into the city with the maximum noise and so failed to exploit the situation intelligently. This was the cause of Aegyrium's preservation and the Aetolians' destruction. [11] They thought that all that has to be done to occupy an enemy city is get inside the gates and they behaved accordingly.

58. They stayed in formation in the market-place for only a short time and then scattered because of their passion for plunder. They started breaking into the houses and looting the contents just as it was getting light.

[2] The situation the people of Aegyrium found themselves in came as an utter surprise and shock. Those who had enemy troops forcing their way into their houses panicked and in terror all tried to escape outside the city, believing it was already securely held by the enemy. [3] Those in houses that were still untouched rushed out to see what was happening, heard the din and all fled to the citadel. [4] These increased in numbers and confidence, while on the contrary the Aetolian force was becoming less effective and more disorganized for the reasons indicated. [5] Dorimachus and his men saw the danger they were in. They regrouped and made an attack on those holding the citadel, expecting that bold and vigorous move would over-awe and scatter those who had rallied for a stand. [6] The men of Aegyrium cheered each other on: they put up resistance and bravely met the Aetolians in close combat. [7] The citadel was unwallled, so the fighting was hand-to-hand. At first the struggle was as desperate as is to be expected with one side fighting for their homeland and children, the other for survival. In the end, the Aetolian intruders were routed. [8] The men of Aegyrium took advantage of the Aetolian recoil and attacked the enemy in determined and intimidating fashion. The result of this was that most of the Aetolians were trampled to death by one another at the gates in the wild panic of their attempt to escape. [9] Alexander fell in close combat in the

thick of the action, Archidamus died in the suffocating crush round the gates. [10] The rest of the Aetolians were trampled to death or broke their necks while trying to escape down the cliffs where there were no paths. [11] The remnant that got way to the boats had the disgrace of throwing away their shields and made the crossing back in a way they never expected. [12] The people of Aegyrium lost their native city through negligence but recovered it against all expectation through courage and valor.

Translated by Douglas Kelly.

23. Polybius 4.8.9–11. Military Prowess: Regional Differences (Second Century)

Introduction

This document discusses differences in military aptitude, illustrating the fairly common ancient idea that these had a state or regional character.

Document

4.8. [9] Some men are fearless in the hunting-field in facing encounters with wild animals but are also cowardly in the face of combat with the enemy. Some men are expert and proficient in individual combat but useless in a massed formation. [10] Thessalian cavalry are irresistible when in squadron or line but out of formation they are slow and helpless in individual action to exploit any opportune moment or position. Aetolian cavalry are the exact opposite. [11] On land and sea Cretans are irresistible in ambushes, raids, stealth attacks, and night attacks, in fact in any kind of small-scale warfare involving deception. In a pitched face-to-clash of phalanx against phalanx, Cretans are cowardly and natural shirkers. Achaeans and Macedonians are the exact opposite.

Translated by Douglas Kelly.

24. Polybius 11.13.3–8. The Quality of Troops: Citizen Soldiers versus Mercenaries, Mantinea (207)

Introduction

This document describes mercenaries and their employers, proposing the

theory that mercenaries and citizen troops exhibit different characteristics according to the nature of their state or employer.

Document

11.13. [3] After some time the superior numbers and skill, thanks to their training, gave the mercenaries of Machanidas, tyrant of Sparta, the upper hand over those of Mantinea [at the battle of Mantinea, 207]. [4] This is generally likely to be the outcome. [5] It is the case that the troops of constitutional republics show more spirit in battle than the subjects of tyrants. However, by the same degree the mercenaries under despots are naturally superior to and outclass those mercenaries serving in constitutional republics. [6] For citizen troops the fighting is about freedom or slavery, but by the same token for mercenaries it is about obvious economic advantage or a matter of honor in face of clear and present danger. [7] When a constitutional republic has done away with those hostile to it, it no longer relies upon mercenaries to keep its freedom, but a tyranny has greater need of mercenaries because it is playing for higher stakes. [8] A tyranny has more people hostile to it because it is more oppressive. The security of despots depends in general on the goodwill and the capacity of its mercenaries.

25. Polybius 11.14.2–4. Success in War: A General's Competence, Mantinea (207)

Introduction

This extract from Polybius' Histories discusses the nature of a commander's competence.

Document

11.14. [2] That most successes in war depend upon either the competence or the incompetence of the commanders is a question that has occasioned some debate but on this occasion [the battle of Mantinea, 207] it was settled once and for all. [3] It is no small thing to seize an initial advantage and put the finishing touch to it. It is a far greater matter to keep one's presence of mind when the first attack has gone wrong, to observe the enemies'

hesitation in the moment of success and to launch an assault that capitalizes on their mistakes. [4] There are numerous cases of the side that appeared to have the advantage in the early stages meeting with complete failure and of the side that appeared to have come to grief at the outset pulling off a complete reversal through sheer determination.

Translated by Douglas Kelly.

26. Polybius 18.29–32. The Advantages and Limitations of the Macedonian Phalanx in Comparison with the Roman Army (Early Second Century)

Introduction

This extract discusses the difference between the Macedonian phalanx (widely adopted across Greece by this time) and the Roman army. It is designed to explain to Greek readers how the legendary Macedonian phalanx was defeated during the Roman conquest of Greece. The description of the sarissa, a long two-handed spear used by the heavy infantry, and the phalanx probably also applies to the phalanx under Philip II and Alexander the Great and his successors, although the original sarissa appears to have been around 3 feet (1 meter) longer. The weaknesses of the phalanx on rough terrain would also have applied under Philip and Alexander, although their use of cavalry and other infantry seems to have been more sophisticated and effective than under Philip V and would have considerably mitigated the limitations. Of additional interest is the respect still accorded to Homer in military matters, even as late as the second century. See also Documents 21 and 27.

Document

18.29. For many reasons it is easy to understand that when the phalanx has its own inherent character and strength nothing can sustain its frontal attack or withstand its charge. [2] For, when it has closed formation for action, each man with his arms, occupies a space of three feet [1 meter] in width, and the length of the *sarissa* according to the original design is 16 cubits [24 feet, or 7.4 meters]. [3] As adapted for actual need it is 14 cubits [21 feet, or about 6.5 meters], of which four cubits [6 feet, or just under 2 meters] are taken up by the distance between the bearer's hands and the

length of the weighted portion of the *sarissa* behind him that keeps it level. [4] It is evident then that the *sarissa* must extend 10 cubits [15 feet, or about 4.6 meters] in front of each hoplite when he charges the enemy grasping it with both hands. [5] As a result, while the *sarissae* of the second, third, and fourth ranks extend farther than those of the fifth rank, those of the fifth rank extend 2 cubits [3 feet, or around 1 meter] beyond the men in the first rank, when the phalanx has its characteristic close order in both depth and breadth, [6] as Homer expresses it in these verses:

Spear crowded spear,
Shield, helmet, man pressed helmet, man, and shield.
The hairy crests of their resplendent helmets
Kissed close at every nod, so close they stood.
[Homer, *Iliad* 13.131]

[7] This description is both true and fine, and it is evident that each man of the first rank must have the points of five pikes extending beyond him, each one two cubits [3 feet, or around 1 meter] from the next.

30. From this we can easily imagine the nature and force of a charge by the whole phalanx when it is 16 deep. [2] In this case those further back than the fifth rank cannot use their *sarissae* so as to take any active part in the danger of battle. [3] They therefore do not individually level their spears, but hold them slanting up in the air over the shoulders of those in front of them, in order to protect the whole formation from above, keeping off by this serried mass of spears those missiles which, passing over the heads of the first ranks, might fall on those immediately in front of and behind them [see the second illustration in the Phalanx entry]. [4] These men, though, by the sheer pressure of their body weight in the charge add to its force—and it is quite impossible for the front ranks to face about.

[5] This being in general and in detail the disposition of the phalanx, for purposes of comparison, I must now speak of the characteristics of the Roman equipment and formation and the points of difference in both. [6] Now in the case of the Romans also each soldier with his arms occupies a space of three feet [1 meter] in width, [7] but in accordance with their mode of fighting each man must move separately. As he has to cover his person with his long shield, turning to meet each expected blow, and as he uses his sword both for cutting and thrusting [8] it is obvious that a looser order is required and each man must be at a distance of at least three feet from the

man next him in the same rank and those in front of and behind him, if they are to be of real use. [9] The consequence is that one Roman must stand opposite two men in the first rank of the phalanx, so that he has to face and encounter ten pikes, [10] and it is both impossible for a single man to cut through them all in time once they are at close quarters and by no means easy to force their points away, as the Roman rear ranks can be of no help to the front rank either in forcing the *sarissae* away or in using the sword. [11] So it is easy to see that, as I said at the beginning, nothing can withstand the charge of the phalanx as long as it preserves its characteristic formation and force.

31. What then explains the Roman success, and what is it that defeats the purpose of those who use the phalanx? [2] It is because in war the time and place of action is uncertain and the phalanx has only one time and one type of terrain in which it can perform its proper function. [3] Now, when a decisive battle was impending, if the enemy [the Romans in this case] had to adapt themselves to the times and terrain needed by the phalanx, those who use the phalanx would in all probability, for the reasons I stated above, always get the better of their enemies. [4] But if it is not only possible, but easy, to avoid the onset of a phalanx, why should anyone still dread an attack by such a formation? [5] Again, it is acknowledged that the phalanx requires level and clear ground with no obstacles such as ditches, gullies, clumps of trees, ridges and water courses, [6] all of which are sufficient to impede and break up such a formation. [7] Everyone would also acknowledge that it is almost impossible, except in very rare cases, to find spaces of say 20 stades [about 2.25 miles or 3.6 kilometers] or more in length without such obstacles. [8] But even if we assume it to be possible, supposing those who are fighting against us refuse to meet us on such ground, but move around sacking the cities and devastating the territory of our allies, what is the use of such a formation? [9] For by remaining on the ground that suits it, not only is it incapable of helping its friends but it cannot even ensure its own safety. [10] For an enemy in complete control of the open country will easily prevent the arrival of supplies. [11] But if the phalanx leaves the ground appropriate for it and attempts an engagement, the enemy easily defeats it. [12] Again, if it is decided to engage the phalanx on level ground, and instead of using the total force when the phalanx has its one opportunity for charging, an enemy keeps out of action even a small part of it at the moment of the shock,

32. it is easy to tell what will happen from what the Romans always do at present. The likelihood of the result I now indicate needs no argument but only the evidence of actual facts. [2] For the Romans do not make their line equal to the enemy and expose all the legions to a frontal attack by the phalanx, but keeping part of their forces in reserve the rest engage the enemy. [3] Afterwards, whether the charge of the phalanx drives back the force opposed to it or is repulsed by it, its proper formation is broken up. [4] For whether following up a retreating enemy or fleeing from a pursuing one, parts of their own army are left behind. [5] This creates gaps in the space formerly held by the phalanx in which the enemy's reserve has room to attack—no longer in the front but on the flank and rear of the phalanx. [6] When it is therefore easy to guard against the opportunities and advantages of the phalanx, but impossible to prevent the enemy from taking advantage of the right moment to act against it, the one kind of formation [Roman] naturally proves in reality superior to the other [the phalanx].

[7] Again, those who use the phalanx have to march through and encamp in every variety of country; they have to occupy favorable positions in advance, besiege certain positions and be besieged in others, and to meet attacks from unexpected directions. [8] For all these contingencies are part of war and victory, sometimes wholly and sometimes very largely, depends on them. [9] Now in all these situations the Macedonian formation is at times of little use and at times of no use at all, because the phalanx soldier is not useful either in detachments or alone, while the Roman formation is efficient. [10] For every Roman soldier, once armed and sets about his business, can adapt himself equally well to every place and time and can meet attacks from every quarter. [11] He is likewise equally prepared and equally in condition whether he has to fight together with the whole army or with a part of it, or in maniples or alone. [12] So since in all particulars the Romans are much more serviceable, Roman plans are much more apt to result in success than those of others. [13] I thought it necessary to speak on this subject at some length because on the actual occasions when the Macedonians suffered defeat many Greeks considered the event as almost incredible, and many will still continue to wonder why and how the phalanx comes to be conquered by troops armed in the Roman fashion.

Asclepiodotus (First Century)

Asclepiodotus was a first-century philosopher who wrote a technical treatise on the organization and tactics of a model army. This was designed to provide instruction to those interested in warfare.

27. Asclepiodotus, *Tactics* 5. The Phalanx (First Century)

Introduction

In this passage, Asclepiodotus describes the equipment and formation of the Macedonian phalanx. Although very similar to the description in Polybius (Document 26, see also second illustration in Phalanx entry), Asclepiodotus provides different lengths for the sarissa, a long two-handed spear used by the heavy infantry. If he is accurate here, it seems likely that represents a further shortening of the sarissa from the original design under Philip II of Macedon. There is no evidence that anyone designed sarissae of different lengths to ensure a uniform line of spear points in front of the phalanx. See also Document 21.

Document

5. The best shield for use in the phalanx is the Macedonian, of bronze, 8 palms [24 inches, or 62 centimeters] in diameter, and not too concave. In addition, their spear is not less than 10 cubits [15 feet, or about 4.6 meters], so that the part that projects in front of the rank is not less than 8 cubits [12 feet, or about 3.7 meters]—but in no case is it longer than 12 cubits [18 feet, or just under 6 meters], in which case it projects forwards 10 cubits. Now when the Macedonian phalanx uses such a spear in a close formation it appears irresistible to the enemy. For it is obvious that the spears of the first 5 ranks project beyond the front, since the soldiers in the second rank, being 2 cubits [3 feet, or around 1 meter] back, extend their spears 8 cubits [12 feet, or about 3.7 meters] beyond the front, those in the third rank 6 cubits [9 feet, or just under 3 meters], those in the fourth rank 4 cubits [6 feet, or just under 2 meters], and those in the fifth rank 2 cubits. So, 5 spears extend beyond the first rank. [2] And the Macedonians, men say, with this line of spears not only terrify the enemy by their appearance, but also motivate every file-leader, protected as he is by the strength of 5 spears. The men in the ranks behind the fifth, although they cannot extend their spears beyond

the front of the phalanx, nevertheless push forward with their bodies and remove any hope of flight from their comrades in the front ranks. But some, who wish to bring all the projecting spear-points to the same distance in front of the line, increase the length of the spears of the rear ranks.

Plutarch (ca. 45–120 CE)

Plutarch (Lucius(?) Mestrius Plutarchus), from Chaeronea in Boeotia wrote parallel biographies of many of the important ancient Greek and Roman political and military leaders. He may have held some civil administration posts, but apparently had no military experience. His work preserves much valuable information from earlier writers, but should be read as biography and not history. This is because Plutarch's aim was to reveal the moral character of his subjects, and draw lessons from these, rather than to construct an accurate historical picture.

28. Plutarch, *Pelopidas* 5–6. Conflict between Sparta and Thebes—Phoebidas' Attack on Thebes (382)

Introduction

This document describes the Spartan seizure of the Cadmea, the citadel of Thebes in 382. Relations between the two cities had deteriorated after their victory over the Athenians in the Second Peloponnesian War (431–404) and 382 marked a significant increase in Sparta's external ambitions. In addition to Phoebidas' attack on Thebes the Spartans had already dispatched an expedition against the Chalcidian Confederacy and soon after seizing the Cadmea rebuilt Plataea as a counterweight to Thebes. Although Phoebidas' attack was supposedly unauthorized, Sparta kept its garrison in Thebes. This gave Sparta control of the city, and Boeotia, although at some cost to its reputation for honest dealings. However, the control was relatively short. Plutarch Pelopidas 7–13 has an interesting account, too long to reproduce here, of how Pelopidas and his party regained control in a coup in 379. They

preserved their independence with the assistance of an alliance with Athens. The request for Spartan intervention by a faction in Thebes is a good example of the phenomenon described by Thucydides in Document 9.

Document

5. After this the Spartans ostensibly treated the Thebans as friends and allies, but they really looked with suspicion on the ambitious spirit and the power of the city, and above all they hated the party of Ismenias and Androcleides, to which Pelopidas belonged, and which was considered to be friendly to freedom and democracy. [2] Therefore Archias, Leontidas, and Philip, men of the oligarchic faction who were rich and exceedingly ambitious, tried to persuade Phoebidas the Spartan, as he was marching past with his army, to seize the Cadmea by surprise, expel the party opposed to them from the city, and bring the government under Lacedaemonian control by putting it in the hands of a few men. [3] Persuaded by this, Phoebidas attacked the Thebans when they did not expect it (it was the festival of the Thesmophoria), and got possession of the citadel. Then Ismenias was arrested, taken to Sparta, and a little later executed, while Pelopidas, Pherenicus, Androcleides and many others fled and were proclaimed outlaws. Epaminondas, however, was allowed to remain in the city; because of his philosophy he was looked down upon as a recluse, and because of his poverty considered powerless.

6. The Lacedaemonians removed Phoebidas from command and fined him 100,000 drachmas, but nevertheless still occupied the Cadmea with a garrison. All the rest of the Greeks were amazed at their inconsistency, since they punished the wrong-doer, but approved his action. And as for the Thebans, they had lost their ancestral form of government and were enslaved by Archias and Leontidas. Nor had they any hope of escape from this tyranny, [2] which they saw was protected by the dominant military power of the Spartans and could not be overthrown unless somehow the Spartans might be deposed from their command of the land and sea. Nevertheless, Leontidas and his associates, learning that the fugitive Thebans were living at Athens, where they were not only in favor with the common people but also honored by the upper class, secretly plotted against them. Sending men who were unknown, they treacherously killed Androcleides, but failed in their plot against the rest. [3] Letters also came from the Lacedaemonians charging the Athenians not to harbor or

encourage the exiles, but to expel them as men declared by the allied cities to be common enemies. The Athenians, however, not only yielding to their traditional and natural instincts of humanity, but also making a grateful return for the kindness of the Thebans, who had been most ready to aid them in restoring their democracy, and had passed a decree that if any Athenians marched through Boeotia against the tyrants in Athens, no Boeotian should see or hear them, did no harm to the Thebans in their city.

Polyaenus (Active ca. 162–166 CE)

Polyaenus was a Macedonian rhetorician who ca. 162–166 CE wrote the *Strategemata*, a collection of military stratagems and tricks apparently to help Marcus Aurelius and Lucius Verus in their Parthian War. The *Strategemata* is rather an academic collection, but it does preserve some interesting snippets of history.

29. Polyaenus 3.14. The Capture of Ilium (ca. 357–355)

Introduction

Charidemus was an Athenian general and his capture of Ilium (on the site of Troy) in Asia Minor probably took place during Athenian operations in the Hellespont either during or around the time of the Social War (357–355) between Athens and her rebellious allies. The accuracy of the account is unverifiable but is typical of the types of ruse or stratagem collected by ancient military writers.

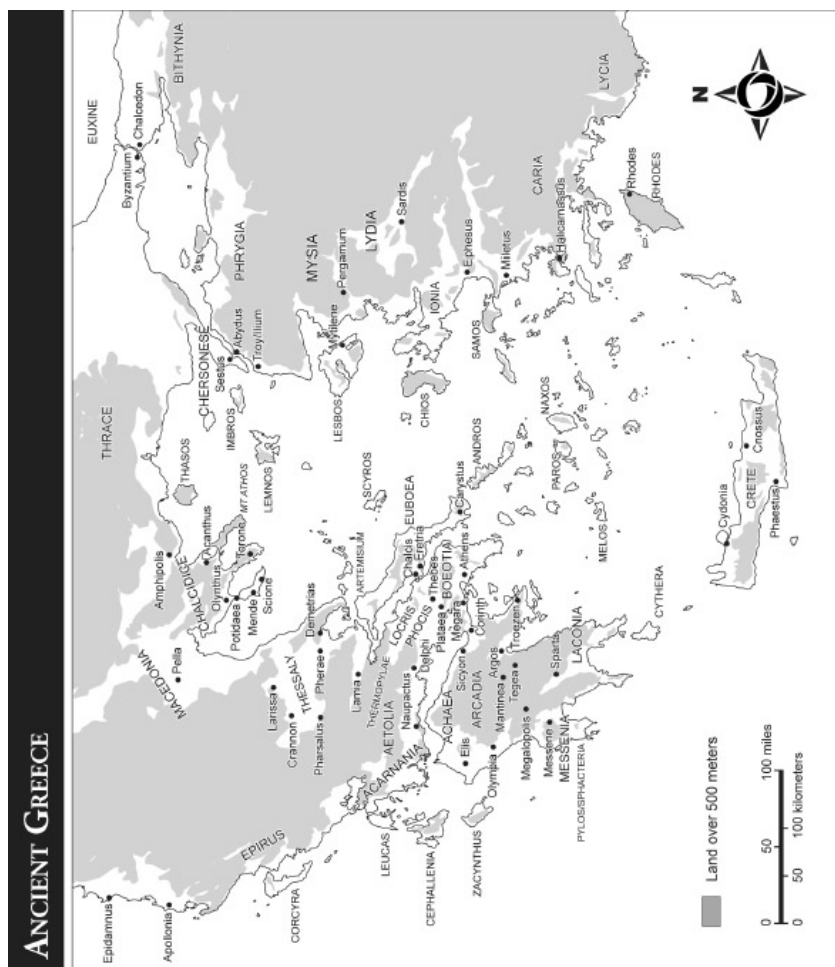

Document

3.14. When the people of Ilium were raiding a town held by Charidemus, he captured a slave from Ilium who had come out on a plundering raid. Charidemus induced him by large bribes to betray the city. With the object of making this slave appear trustworthy to those guarding the gates, he gave him some sheep and some slaves as plunder two or three times. The guards took their share of these and allowed him to go out at night a number of times, along with a large body of men to round up the plunder.

Then one night Charidemus seized the men accompanying the slave and put them in chains. He dressed some of his own men, who were fully armed, with the prisoners' clothes and gave them some booty, including a horse they could say was captured. The guards opened the gates wide to let the horse in. Charidemus' troops charged in behind the horse and killed the guards. They then picked up the rest of his army and took control of the city. The result was, joking apart, that Ilium was once again the victim of a successful horse stratagem.

Glossary

This glossary is designed to help with specialist or technical Greek words or phrases used in writings about Greek conflict. Although it lists most of the commonly used specialist terms, as this book is not a Greek dictionary it cannot pretend to include all conflict-related Greek terms. Entries are listed alphabetically and words in italics are transliterations of Greek words. An asterisk indicates a more detailed entry or discussion appears under the same name in the main body of the encyclopedia (where the main entry name is in a different form, this is supplied in brackets after the asterisk). Note that Greek has no “c” and if you are looking up latinized/anglicized forms (such as “*crypteia*” or “*cataphractoi*”) these may appear under “k” (“*krypteia*,” “*kataphractoi*”).

Agema: military contingent; sometimes elite troops (Macedonian and Seleucid armies).

Agoge: rigorous Spartan state physical and military training regime applied to all male Spartiates from childhood.*

Agōn (plural, *agōnes*): contest, competition, battle; also an assembly or gathering.

Agora (plural, *agorai*): market place. The *agora* of a city was often its main social center, as was the case at Athens where “Athenian Agora” (or just “the Agora”) is often used to reflect its significance and distinguish it from other *agorai*.

Aichmalotos (plural, *aichmalotoi*): captive, prisoner of war, but can also apply to captured livestock or goods (literally, “taken by the spear”).

Akolouthos: attendant.

Akon (plural, *akontes*): javelin.

Akontistes (plural, *akontistai*): javelin-equipped soldier.

Amentum (Latin term): a loop attached to a javelin to allow the thrower to impart spin to the weapon and increase the distance thrown.

Andreia: manliness, bravery.

Anthippasia: mock battle between sections of the Athenian cavalry staged as both a training exercise and public display.

Apoikia: colony, settlement away from home.

Arche: rule, empire, power; also official, magistrate.

Archon (plural, *archontes*): chief magistracy at Athens (after ca. 487 it was supplanted in importance by the *stratego*).

Arête: excellence, virtue, courage; the reward of excellence, especially fame, distinction; in plural (*aretai*): great deeds.*

Argyraspides: Silvershields—infantry unit in the armies of Alexander the Great and his Successors.

Argyrologia (or *argyrologos*): raising or levying money.

Aristeia: the feats or deeds of a hero or the prize awarded for them.

Aspis (plural, *aspides*): the large round shield carried by hoplites.

Astrateia: crime of avoiding military service; also, exemption from military service.

Asyilia: sanctity, inviolability.

Boule: the Council of 500 at Athens which prepared the agenda for the assembly and handled day-to-day administration between assembly meetings; similar institutions existed in most Greek cities.

Chalkotheke (literally “bronze store”): a building on the Acropolis used originally to store the metal offerings to Athena but later as an arsenal to store weapons and naval equipment.

Chora: the territory of a *polis*; its agricultural hinterland.

Cleruch: Athenian military settler or colonist.

Cleruchy: Athenian military settlement or colony.

Deilia: cowardice.

Dekadarch (*dekadarchos*, plural, *dekadarchoi*): literally “leader of ten”; a rank in the Spartan infantry.

Dekate: tithe or dedication of a tenth part (e.g., of booty).*

Deme (*demos*, plural, *demoi*): The basic Athenian social and political organizational unit under Cleisthenes' reforms; *demos* also refers to the people as a whole.

Diadochoi (literally "successors"): the men who took over and ruled the various parts of Alexander the Great's empire after his death.* [Successors (*Diadochoi*), Wars of].

Diekplous: naval maneuver, involving sailing through an enemy's line then turning and attacking from the rear.*

Dieres: bireme (warship with two rows of rowers).

Doriktetos chora: conquered territory (literally "spear-won land").

Doru (plural, *dorata*): spear.

Drachma (*drachme*, plural *drachmai*): unit of weight or currency; at Athens a drachma = six obols.

Eirene: peace.* [Peace (*Eirene*)].

Eisphora: special wartime tax levied to pay for the war.

Ekdromos (plural, *ekdromoi*): a soldier who charged out of the ranks (as part of a designated group) to drive off an enemy.

Eleutheria: freedom.* [Freedom (*Eleutheria*)].

Enchos: spear.

Enomotia: infantry unit of the Spartan army (also any group of soldiers bound together by oath).

Enomotiarchos: leader of an *enomotia*.

Eparittoi: picked or elite troops of the Arcadian Confederacy.

Ephebeia: Athenian state youth-training system from the mid-fourth century.* [Ephebes, *Ephebeia*].

Epheboi (singular, *ephebos*): ephebes (boys between the ages of 15 and 20); at Athens, also youths undergoing the *ephebeia*.* [Ephebes, *Ephebeia*].

Ephor (*ephoros*, plural, *ephoroi*): annually elected magistrate at Sparta.

Epibatai (singular, *epibates*): hoplites serving as part of a ship's complement; marines.*

Epilektoi: picked or chosen troops who formed a permanent or semipermanent force in many Greek states in the fourth century.

Epimachia: defensive alliance.

Epiteichismos: building fortifications near or inside an enemy frontier,

often to serve as a forward base for operations.*

Gastrophetes: a tension-powered weapon probably similar to a large crossbow, fired with its butt resting on the firer's stomach.

Gymnoi: light-armed troops.* [Light Troops (*Psiloi*, *Gymnoi*)].

Hamippoi (singular, *hamippos*): infantrymen (usually light) who operated with cavalry.*

Hegemon: leader, commander in chief.*

Hegemonia: command, rule (especially of a coalition force or of an empire).* [*Hegemon*, *Hegemonia*].

Hellenotamiai: financial officials of the Delian League (literally "Stewards of the Greeks").

Helots (singular, *heiloi* or *heilotes*, plural, *heilotes* or *heilotai*): serf-like class at Sparta.*

Hetairoi: literally "companions"; a title of the Macedonian cavalry.

Hieros Lochos: the Sacred Band (Theban elite troops).* [Sacred Band].

Hipparchos (plural, *hipparchoi*): hipparch, or cavalry commander, at Athens and elsewhere.

Hipparmostes: a cavalry commander at Sparta.

Hippeis (singular, *hippeus*): cavalry; in the singular, it denotes a cavalryman or rider. It also has specialized usage at Athens to denote members (who had a military obligation to serve in the hoplites or cavalry) of the second highest of the census classes established by Solon, and at Sparta, the kings' bodyguard.*

Hippotoxotai: (singular, *hippotoxotes*): horse-archers.*

Homoioi: (singular, *homoios*): full citizens of Sparta (literally "equals" or "the same in rank").

Hoplitagogos: troop ship.

Hoplite (*hoplites*, plural, *hoplitai*): heavy infantryman equipped with *aspis* (shield) and spear and perhaps (but not always) breast-plate, helmet, and greaves.*

Hypaspistes (plural, *hypaspistai*): shield-bearer, attendant; in plural, a type of infantry in Macedonian and later armies.

Hyperesia: ship's crew, rowers; also attendants.

Hyperetes (plural, *hyperetai*): assistant or aide (either a free man or a slave,

depending on the context).

Ile: troop (or squadron) of cavalry.

Kamax (plural, *kamakes*): term (literally “pole”) used by Nicholas Sekunda and subsequently other modern writers to denote a cavalryman’s thrusting spear; probably the same as the hoplite spear or *doru*, but possibly referring to a longer weapon, closer to the *sarissa*.

Katalogos: Athenian register of citizens liable for military service.* [*Catalogus* (*Katalogos*)].

Kataphraktoi: heavily armored cavalry.* [*Cataphractoi*].

Katastasis: establishment; at Athens, the establishment grant paid on enlistment in the cavalry; also the placement or deployment of troops on the battlefield.

Keryx (plural, *kerykes*): herald, envoy.

Kopis (plural, *kopides*): sword, probably of Persian origin, of the same or similar type as the *machaira*.

Krypteia: Spartan secret police/internal security force.* [*Crypteia*].

Leistai: (singular, *leistes*): bandits/pirates.* [Bandits; Piracy].

Lembos: light warship, favored by pirates.* [Ships, War].

Lochagoi: (singular, *lochagos*): subordinate commanders; at Athens, commanders of *lochoi*, or infantry sub-units.

Lochos (plural, *lochoi*): infantry sub-unit; at Athens it may have been the *trittys* contingent of a tribal regiment.

Logades: picked or chosen troops.

Machaira (plural, *machairai*): sword, probably with curved blade, not unlike a larger version of the Gurkha kukri.

Mantis (plural, *manteis*): seer, soothsayer, diviner of the future.

Metic (*metoikos*; plural, *metoikoi*): resident alien (especially at Athens).*

Mina (*mna*, plural *mnai*; “mina” is the Latin form): unit of weight or currency; at Athens a *mina* = 100 drachmas and was a sixth of a talent.

Monomachy: duel between champions; single combat.

Mora (plural, *morai*): a unit (infantry or cavalry) of the Spartan army.

Nauarchos (plural, *nauarchoi*): navarch, office of admiral at Sparta.

Neodamodeis: newly freed—Spartan term used of freed helots.*

Nome: administrative district or province in Egypt.

Obol (*obolos*, plural, *oboloi*): unit of weight or currency; at Athens six obols = one drachma.

Oikistes: leader of a colonizing expedition, founder of a colony.

Ostracism: Athenian political mechanism to reduce political tension by voting to exile a politician for 10 years.*

Othismos: pushing, generally of shield against shield in hoplite warfare.*

Ouragos: commander of the rearguard.

Paean: hymn sung before battle.

Palton (plural, *palta*): javelin.

Pandemei (of armies): to march out at full-strength; with the entire state's forces.

Panoplia: panoply, full set of hoplite equipment.

Panstratii (deploying, or accompanied by): the whole army.

Peiratai: pirates.* [Piracy].

Peltast (*peltastes*, plural *peltastai*): light infantryman originating in Thrace, equipped with a crescent shaped shield (*pelte*), sword, javelin, or thrusting spear.*

Pentakosiomedimnoi: literally “five-hundred measure men,” the highest Athenian property classification established by Solon, with full military service and finance obligations.

Penteconter also “pentecontor” (*pentekontoros*, plural, *pentekonteroi*): a fifty-oared ship. *[Ships, War].

Perioikoi (singular, *Perioikos*): inhabitants of the outlying villages of Lacedaemonia who did not have the same rights as full Spartiates (the term *perioikoi* is also used of similar groups outside Sparta).*

Periplous: literally “a sailing around,” often used of a naval expedition but can denote sailing around an enemy fleet.

Pezhetaroi: foot companions (a Macedonian troop classification).

Phoros: tribute paid to a ruling state; levied, for example, by Athens from members of the Delian League/Athenian Empire.

Phratry (*phratra*, plural, *phratrai*): literally “brotherhood” but used in a political sense as a tribe or (later) part of a tribe; later usage could encompass any league or association, often with the negative overtone

of a conspiracy.

Phylarchos (plural, *phylarchoi*): commander of a *phyle*.

Phyle (plural, *phylai*): a tribe (the largest internal subdivision of citizens in a city—kinship groups which served administrative and military functions) or a military contingent furnished by a tribe; (at Athens) a 100-man tribal cavalry contingent or squadron.

Pleonexia: greed.

Polemarchos (plural, *polemarchoi*): literally “war leader”; the title of senior military officers in several Greek states.

Polemos: war.

Polis (plural, *poleis*): city or city-state.

Presbeis (singular, *presbys*): generally used in the plural, ambassadors (literally “elders” or “old men”).

Prodromoi (singular, *prodromos*): cavalry scouts.*

Promachos (plural, *promachoi*): a champion, or someone who fought in front of the line; after the introduction of the hoplite phalanx it was a sign of ill-discipline and a punishable offence in some states.

Proskynesis: Persian court practice of prostrating oneself before the Great King as a sign of reverence; controversially introduced to Alexander the Great’s court after his conquest of the Persian Empire.

Protostates (plural, *protostatai*): the man on the extreme right of a rank or (in plural) men of the front rank; also leader of a contingent.

Psilos (plural, *psiloi*): light-armed soldier; could range from archers, slingers, or peltasts to men equipped with nothing more than a dagger or stones.* [Light Troops (*Psiloi*, *Gymnoi*)].

Rhypsaspis: throwing away one’s shield in battle (in order to flee more quickly); an indictable offence at Athens.

Rhyton: cup in a conical or horn shape, often in the shape of an animal or animal’s head and very ornate.

Salpinx: trumpet.

Sarisophoroi (singular, *sarisophoros*): soldiers carrying the *sarissa*; a cavalry unit of the Macedonian army.

Sarissa (plural, *sarissai*): long Macedonian two-handed spear or lance, carried by both infantry and (at least some) cavalry.

Sitos (literally “grain”): an allowance for food for soldiers or, at Athens, for cavalry horses (*hippios sitos*).

Skeuophoros (plural, *skeuophoroi*): attendant to a hoplite, or more generally a baggage carrier or pack-animal.

Skiritai: an infantry unit of the Spartan army recruited from Sciritis in Arcadia.

Speira: Ptolemaic army unit, equated with a Roman manipule (or, later, with a Roman cohort).

Sphagia: (singular, *sphagion*): sacrificial victims.

Sphendonistai (singular, *sphendonistes*): slingers.* [Slingers (*Sphendonistai*)].

Stasis: civil strife or conflict.*

Stele: (plural, *stelai*): a stone block or slab with an inscription and/or artwork used as a monument, public record, or gravestone.*

Strategoia: the office of *strategos* (general/admiral) at Athens.

Strategos (plural, *strategoï*): one of an annually elected board of 10 generals/admirals at Athens.

Stratia (plural, *stratiai*): army.

Stratiotes (plural, *stratiotai*): soldier.

Stratiotides (singular, *stratiotis*): troopships.* [Ships, Transport].

Syntagma: contingent of troops.

Talent (*talanton*, plural, *talanta*): unit of weight or currency; it was generally the largest unit and at Athens consisted of 60 *minae* or 6,000 drachmas.

Taxiarchos (plural, *taxiarchoi*): taxiarch, commander of a *taxis* or infantry company at Athens.

Taxis (plural, *taxeis*): an infantry sub-unit of approximately company size at Athens; the term may also have been used of a cavalry squadron or *phyle*.

Thalamites (plural, *thalamitai*): rower on the bottom row of a trireme.

Thalassokratia: naval power, naval supremacy; control of the sea.* [Thalassocracy].

Thetes (singular, *thes*): lowest Athenian property classification established by Solon, with no military obligation except (later) service as a rower.

Thorax (plural, *thorakes*): breastplate, cuirass.

Thranites (plural, *thranitai*): rower on the upper row of a trireme.

Time: honor, worth (of a thing or individual).

Toxotes (plural, *toxotai*): archer.* [Archers (*Toxotai*)].

Trierarch (*trierarchos*): a citizen who paid for the equipping of, and normally captained, a ship in the Athenian navy for one year.*

Trireme (*trieres*, plural *trierei*s): warship with three vertical banks of rowers —the standard Greek warship in the Classical Period.*

Triittys (plural, *trittyes*): Athenian social and political unit, one-third of a tribe.

Tropaion: trophy* [Trophy (*Tropaion*)].

Tyche: fortune, luck.

Xenia: friendly relations between states (or between individuals or an individual and a state).

Xenos (plural, *xenoi*): stranger, foreigner; guest-friend (i.e., someone from another state with a mutual obligation to provide hospitality); mercenary.

Xiphos: straight sword.

Zeugitai (singular, *zeugites*): second lowest Athenian property classification established by Solon, with the military obligation of service as a hoplite.

Zygites (plural, *zygitai*): rower on the middle row of a trireme.

Bibliography

This bibliography provides a selection of mainly English-language material on ancient Greek warfare and other forms of conflict. It is designed to guide the reader in key areas of conflict in the ancient Greek world.

However, “Ancient Greece” covers a very large geographical and chronological span. This creates problems with organizing a bibliography—most adopt either a chronological or a geographical structure. Both have advantages and disadvantages so this bibliography combines separate thematic listings, with listings focusing on periods. We consider this provides the clearest way to find both the wider picture and a closer examination of a topic.

To avoid repetition, a work will generally only appear in one section. So, material relating to “Hellenistic Warfare” may be in a category like “Logistics, Finance, and Organizations.”

Part 2

Conflict in Ancient Rome

Introduction: Conflict in Ancient Rome

Conflict in Ancient Greece and Rome: The Definitive Political, Social, and Military Encyclopedia provides a comprehensive overview of Greek and Roman warfare, military organization, and civil and social conflicts short of war. This introduction provides a general, chronological, and organizational orientation for the reader. The next section, Reader Information and Abbreviations, introduces the reader to the structure of the encyclopedia entries in more detail. For specific dates, the reader may consult the Chronology section. For a more detailed narrative, see the entry Rome (History) and individual entries on persons and wars.

Conflict in Ancient Greece and Rome is intended to fill a gap between general reference works, such as general encyclopedias, and reference works by and for academic specialists in classical studies. These works tend to assume familiarity with the ancient sources, with Latin, Greek, and modern European languages, and with ancillary disciplines. They frequently invoke familiarity with controversies in the discipline and with the history of scholarship. Academic monographs and papers also frequently employ the exhaustive citation and use of untranslated Latin and Greek passages. In the encyclopedia, disputes in modern scholarship have been kept to a minimum, except when the dispute is essential to the study of the topic as is the case currently with Roman demography, Roman imperialism, and Roman strategy. In these cases, an overview of the controversies is included in the entries. Longer entries on major conflicts, divided into Causes, Course, and Consequences, may also discuss controversies. Where Latin and Greek quotes are used, we have also provided translations.

The entries in the Rome section reflect current trends and interpretations in Roman historical and military studies, covering not just the basic

structures of military institutions but their relationship to society. Thematic articles on imperialism, strategy, tactics, promotion in the army, demography, and war and gender (to name only a few) reflect current scholarship, and more traditional biographical and narrative articles also are based on up-to-date bibliography.

General Orientation

How and why the ancient Romans waged war or engaged in conflict continues to be a subject of fascination across the centuries. Roman legendary and historical conflicts have inspired great works of art and drama, including Shakespeare's *Coriolanus*, *Julius Caesar* and *Antony and Cleopatra* (as well as many Italian operas that remain untranslated), and in the present Hollywood has taken a renewed interest, beginning with Ridley Scott's *Gladiator* (2000) and more recently the HBO Rome series. What made the ancient Romans conquer the rest of the Mediterranean world, and how were they able to do it? Why did they turn on each other in civil war (beginning with Marius and Sulla, the better-known Caesar and Pompey, and the triumvirs, and continuing with civil wars during the empire)? Why did the Roman Empire fall?

The Encyclopedia seeks to answer such questions not just in personal terms (hostility or rivalry) but also in terms of social and political structures and institutions. Warfare was built into Roman men's political careers, as they had to serve for a certain number of campaigns before they could run for office. The competition for political office was fierce. Offices such as the consulship and the less prestigious praetorship were also military commands. A Roman politician of the traditional Republic expected to go to war during his year of office and hoped for a victory that would bring him fame and glory and bring wealth in the form of plunder and enslaved captives. If the Roman Senate permitted, he would celebrate his victory in a triumphal procession that was a festival for the whole city of Rome, and expend some of the wealth on public amenities.

Rome nearly met its match in Carthage, fighting the three Punic Wars (264–241, 218–201, and 149–146 BCE). It also encountered formidable enemies in other peoples, Greeks and "barbarians." The entries on these external wars examine the causes, course, and consequences of these wars, leading to the expansion of the Roman Empire to cover the known Mediterranean

world. Other articles describe various enemy regions and peoples, including the Germans, Britons, and Persians (the Arsacid and Sassanid Empires). Forty articles describe important battles and sieges.

Social and group roles and identities, and historical change, brought with them additional conflict. Solutions to some conflicts tended to engender future conflicts. The resolution of the Struggle of the Orders in the early Republic incorporated the tribunes of the plebs into the Roman Republic's mainstream magistracies. New conflict arose when tribunes of the plebs, beginning with Tiberius Gracchus, exploited the powers of the tribunate to block regular political processes. The recruitment of Italian allies to fight for Rome greatly expanded Rome's military resources in the middle Republic, but the increasingly dissatisfied allies revolted in 91 BCE (the Social War). The recruitment of landless citizens as volunteer soldiers (begun on a large scale by Gaius Marius, the first of the late Republic's great warlords) created its own problems: armies dependent on generals to pay and reward them for service.

The late Republic saw other innovations, such as the growth of extended military commands, which greatly raised the stakes of conflict; the aforementioned armies of volunteer soldiers supported warlords with these commands such as Pompey, Caesar, and Octavian, the future emperor Augustus (27 BCE– 14 CE). Their wars and civil conflicts tore the Republic apart. Augustus sought both to put the Republic back together (in appearance), thus discouraging future conflict such as the assassination of his adoptive father, Julius Caesar, by disgruntled senators, and to assure the stability of the new autocracy dependent on military power. His solutions employed traditional forms configured in new ways. The Romans were both highly conservative and extremely adaptable; many terms for institutions were reused and reworked, as explained in entries on these terms.

New conflicts arose during the Principate (imperial Rome, ca. 27 BCE– 235 CE). Emperors, Senate, and army were often in conflict. Speaking from their exalted social status, senators such as Cassius Dio (writing in the early third century CE) disapproved of imperial expenditure on the army. Some emperors, paranoid about conspiracies, cut a swathe through the Senate and even members of their own families whom they suspected of treason.

The Roman emperors faced a new strategic demand: how to maintain their own power and prevent civil war. In the absence of a formal hereditary monarchy, various alternative modes of imperial succession were

tried, including selecting family members and adopting unrelated individuals. Unfortunately for these, because the emperor's power depended on the army, "emperors could be made elsewhere than at Rome," as the imperial historian Tacitus remarks. The result was outbreaks of civil war in 69 CE, 193–197, 217–222 and from 235 to 284.

During the late Republic and early Empire, Rome evolved from military conquest to government of its conquests. This development has traditionally (in nineteenth- and much earlier twentieth-century scholarship) been treated positively, depicting the Roman peace as bringing civilization to less civilized parts of the Mediterranean and Europe. Many leftist classicists regard this view of "Romanization" as a projection of modern colonialism. Even in antiquity, some authors were skeptical or at least imagined how provincial subjects might articulate their resistance to Rome. In Tacitus' *Agricola*, an encomium of his father-in-law who was a Roman governor and general in Britain in the 70s–80s CE, Tacitus' Scottish leader Calgacus says that "the Romans make a desolation, and call it peace" (Tacitus, *Agricola* 31). Peace was itself a political concept, intended to resolve conflict; specifically, the *Pax Augusta* (Augustan Peace) announced the end of civil warfare.

Dissent and provincial resistance contested this peace. Some of the senatorial aristocrats accused of treason during the Julio-Claudians (27 BCE–68 CE) were critical of the imperial autocracy; others aspired to seize power for themselves; others were allegedly victims of paranoid emperors. The evidence for provincial revolt is somewhat firmer. Besides the over 35 battles and sieges that are the subject of individual entries, there were several large-scale provincial revolts, the most famous being the German revolt (termed the Varian disaster, *clades Variana*) in 9 CE and the Jewish War of 66–70 CE, as well as the British Revolt in 60/61 CE and the major Gallic revolt in 70 CE. A second Jewish revolt, named the Bar Kochba revolt for its leader, broke out in 132–135. The Romans crushed the Jewish War, the British Revolt, the Gallic revolt of 70, and the Bar Kochba revolt severely.

Roman government brought with it both opportunity and conflict for inhabitants of the empire. Military service offered opportunities for members of the equestrian order (a "middle class" of sorts, though a status group rather than a modern economic class) to become elite officers. It also offered a steady income and discharge benefits for ordinary legionaries and praetorians, and the grant of the citizenship on discharge for noncitizen

auxiliaries and fleet soldiers. However, government also brought with it potential conflict. To a great extent, the government was the army; in the absence of a large civil service, the Romans employed soldiers as police and low-level functionaries. The army conflicted with provincial civilians, both directly and over economic interests. Roman troops were tasked with policing rebellious or uncooperative subjects, sometimes described as bandits or brigands. The army had a well-developed logistic system, but soldiers also exacted potentially abusive on-the-spot requisitions, especially during military travel and active campaigns.

Finally, *Conflict in Ancient Greece and Rome* covers the conflicts of the later Roman Empire (traditionally, from 284), including the fall of the western Roman Empire in 476 CE. Diocletian (284–305) and Constantine (306–337) reorganized the later Roman state for more intensive control and faster military response, forming a larger bureaucracy and fast-moving central field armies. But the combination of external incursions and recurrent civil warfare, and the recruitment of allied Germanic fighting forces (effectively mercenaries), fatally weakened the western empire. The western empire succumbed to a series of usurpations; the last successful usurper, Odoacer, chose to make himself a king of Italy rather than emperor of Rome.

The Roman entries also examine topics not directly related to external and civil warfare that nonetheless relate to violent conflict, such as how the Romans defined, tried, and punished capital crimes, and how they maintained public order and imposed “states of emergency” (the ancient analogue to martial law). The Roman scale of punishment varied sharply with social status and rank: the upper classes expected immunity from corporal and capital punishments which were routinely and brutally inflicted on social inferiors—slaves and, in the Principate, free persons of low status. The persecutions of the Christians, which became empire-wide in the mid-third and early fourth centuries, illustrated the vulnerability of ordinary citizens who opposed the authorities. These forms of political violence short of war also conditioned warfare. Civil wars might be revenge for previous atrocities, as in the Marian-Sullan conflict (88–82 BCE). Rivals in civil wars might be labeled “bandits” or “pirates” to discredit them, as Augustus did with one of his rivals, Sextus Pompeius (the son of Pompey the Great).

Historical Outline

The Roman half of *Conflict in Ancient Greece and Rome* covers the period from the beginnings of Rome to the fall of the western Roman empire in 476 CE. The material on the Roman monarchy (753–510 BCE) focuses on the fall of the monarchy and establishment of the Republic. This is a relatively shadowy period in Roman history, for which no contemporary literary sources survive; later authors, such as Livy, filled out a thin political narrative with legend and vividly imagined scenes. The articles on the early Republic (ca. 509–264 BCE) accordingly reflect scholarly debate on their period, though their main thrust provides traditional content as a foundation for such debate.

With the First Punic War (264–241 BCE) the history of the Roman Republic emerges into the light of day, provided by more contemporary sources (Polybius, who wrote in the mid-second century BCE). This period, from 264 to 133 BCE, is termed the middle or classical Roman Republic. It is sometimes termed the “traditional” Roman Republic in our articles, for the Roman elite regarded its political institutions as time-honored. The middle Republic includes the Second Punic War (218–201 BCE), in which Carthaginian armies, led by the formidable general Hannibal, invaded Italy and almost destroyed the Roman state; the Romans, led by the young and highly talented general Scipio Africanus, were victorious in the end. The middle Republic also includes Rome’s expansion overseas, defeating Macedon and acquiring dominance over the eastern Mediterranean, and the Third Punic War (149–146 BCE), in which Rome finally destroyed Carthage and razed the city of Carthage.

The late Republic extends from 133 BCE (the outbreak of political and social conflict in the tribunate of Tiberius Gracchus) to the end of the Republic with the victory of Octavian over Mark Antony and Cleopatra in 31 BCE. This period is marked by civil war and civil conflict short of war, including the civil war of Marius and Sulla (termed the Marian-Sullan conflict, as not all of it took place as war) and the conspiracy of Catiline against the Roman state. The late Republic also saw the growth of extraordinary commands, such as Pompey’s to combat Mediterranean piracy and the Asia Minor king Mithridates VI, culminating in Julius Caesar’s conquest of Gaul and the division of the Roman Empire among the triumvirs Octavian, Antony, and Lepidus. Octavian emerged from the civil

war that ensued, as the victor and sole ruler of the Roman Empire.

The imperial period extends from Octavian's adoption of the name Augustus and the consolidation of his political powers in 27 BCE, to the fall of the Western Empire. However, its temporal divisions include the Augustan period (27 BCE–14 CE) and the Julio-Claudian dynasty (14–68 CE), then a period of civil war (68–69), leading to the establishment of the Flavian dynasty (69–96). That dynasty was overthrown with the assassination of the emperor Domitian in 96. Five stable reigns followed, in which succession was assured by adoption.

The empire, however, descended into a period of crisis (repeated civil wars, usurpations, and exterior incursions) from ca. 193 to 284, though the “third-century crisis” is conventionally dated from 235 to 284. The period termed the later Roman Empire conventionally begins in 284, with the reign of the emperor Diocletian (284–305), though many features of the later Roman Empire began earlier than this. The later Roman Empire faced new threats, such as a more aggressive Persian Empire and incursions of Germanic peoples, and continued to face civil war and usurpation. How the western later Roman Empire became unstable and finally ended as a political entity is covered in this encyclopedia, but the Byzantine (eastern Roman) empire from 476 to 1453 is not included.

General Organization

The Reader Information and Abbreviations section explains in greater detail how to use the entries. It is followed by a historical chronology intended to orient the user in space and time. The section also contains a discussion of Roman nomenclature and dating systems and a list of frequently used abbreviations. It is followed by a thematically and alphabetically organized Guide to Related Topics.

The Further Reading section of each entry presents key primary sources and current or recent and accessible scholarship in English related to the entry. The editors hope that with these references as a starting point, a curious and adventurous reader may delve further into the sources and into more detailed scholarship. Distinct from the specific Further Reading, the general Bibliography section is topically organized, intended to provide a survey of scholarship on Roman military, political, and social institutions.

The Primary Documents section is a selection of Greek and Latin

sources in translation. These are intended to present the highlights of ancient authors on relevant topics, and are organized by author (21 works by 14 authors, plus 2 inscriptions). The Documents section is necessarily highly selective. Many more comprehensive collections of Greek and Roman sources in translation have been published. In the Primary Documents section, each document provides introductory material on the author and the topic; citation numbers and the sources of the translations are included. A Glossary lists and explains common Greek and Latin terms. Both the Glossary and the entries for those terms differentiate the tendency of the Romans to use the same word for multiple institutions over time. The Bibliography follows this section.

Reader Information and Abbreviations

Entries

The body of an entry is followed by two sections. “See also” directs the readers to associated entries which either provide background context or additional detail on the main topic, or to separate entries on individuals, places or events, mentioned in the entry. Where there is no possibility of confusion, the headwords in the “See also” may be abbreviated—for example, just “Hadrian” rather than the full “Hadrian (emperor)” or “Cynoscephalae” rather than “Cynoscephalae, Battle of (197 BCE).”

Further Reading directs the reader to additional reading on the topic. The first part of this (if appropriate) lists the relevant ancient sources. These supply the main references for the topic, and the evidence to support any statements made in the body of the entry (direct quotations and paraphrased statements from an ancient author are generally given a reference at the relevant point in the body of the entry).

The ancient works are listed in chronological order, which means that the source closest in time to the topic, which is usually the most useful, is listed first. However, this is not always the case. Ancient references are listed for biographical and narrative articles, not for institutional articles where the evidence is often much more widespread.

In classical scholarship, ancient authors and titles have standard abbreviations such as “Tac. *Ann.* 1.17.4–5” for Tacitus, *Annals* 1.17.4–5. The abbreviations are one of the barriers to entry for students of the classics and have been expanded. For authors of single works, the title is omitted and is listed in the Abbreviations.

The ancient references follow the standard book/chapter/section systems, which are more precise than a page number in a translation and

allows the reader to check any available version of the text. Prose works, such as histories or biographies, were divided in antiquity into books, chapters, and sometimes also sections. However, in some cases short works are just divided into chapter and sections or just chapters. For example, “Dio 52.27.5” or “Tacitus, *Annals* 1.17.4–5” mean, respectively, “Cassius Dio, *Roman History*, Book 52, chapter 27, section 5” and “Tacitus, *Annals of Imperial Rome*, Book 1, chapter 17, sections 4–5.” References to poetry or drama are by line number, so “Virgil, *Aeneid* 11.1121–1210” means “Virgil, *Aeneid*, Book 11, lines 1121–1210.” References to speeches, such as Cicero’s orations, are by title (e.g., *Pro Lege Manilia*) and section. In the ancient source section of the Further Reading the authors are separated by a semicolon, with internal separation within an author, or between works by the same author, indicated by a comma.

The Further Reading section also includes references to the Documents in the back matter, listed by number and to the Quotable Quotes appendix, abbreviated QQ and listed by number.

The list of ancient references is followed by modern works. These are listed alphabetically and concentrate on the most important and accessible English-language works on the topic. Non-English works are only listed where there is no appropriate English-language work on the topic.

Roman Names

A traditional male Roman’s name was, like Gaul, divided into three parts. The first part, or praenomen, was restricted to a small number of possible names: *Appius*, *Aulus*, *Decimus*, *Gaius*, *Gnaeus*, *Lucius*, *Manius*, *Marcus*, *Numerius*, *Publius*, *Quintus*, *Sextus*, *Spurius*, *Tiberius*, *Titus*. Praenomina are often abbreviated to initials. The second part was the gentilician or family name, for example, *Claudius*, *Cornelius*, *Julius*, *Tullius*. The third part was the cognomen (pl. cognomina) or “personal” name, which originally may have denoted a personal attribute. Over time, since cognomina were also handed down, they denoted branches of families rather than individual attributes, and an individual might distinguish himself with a fourth name or agnomen, often referring to a personal trait or exploit, as in *Publius Cornelius Scipio Africanus*.

An adoption from one family into another was shown by the adoptee’s taking the adopter’s family names, adding an agnomen consisting of his

original family name stem plus *-ianus*. Thus the two sons of Lucius Aemilius Paullus who were adopted by the Fabii Maximi and the Cornelii Scipiones became, respectively, Quintus Fabius Maximus *Aemilianus* and Publius Cornelius Scipio *Aemilianus*. A famous Roman is most often designated in modern scholarship by his cognomen and agnomen, if both are necessary to distinguish him from others of his lineage.

Traditionally, Roman women bore only the female form of the gentilician name, e.g., *Cornelia*, but a second name to indicate birth order was sometimes added. These rules of nomenclature for both genders broke down in the Principate and especially in the middle and later empire. Names were combined more freely (often becoming long strings of names) and women's names became more distinctive.

In this work, for clarity, we have chosen to use the familiar English names of famous Romans, except at the first instance in their biographical articles. Thus Caesar is introduced as Gaius Julius Caesar in his biographical article and is elsewhere termed Caesar. Crassus (the triumvir, d. 53 BCE) is introduced as Marcus Licinius Crassus and is elsewhere termed Crassus. Marcus Antonius, after being introduced, is termed Mark Antony or simply Antony. The most famous Roman of all, Augustus, was known to contemporaries first as Gaius Octavius, then, following his adoption by Caesar, Gaius Julius Caesar Octavianus, or Octavian. After Caesar was assassinated on the Ides of March, Octavian was termed Caesar by contemporaries, but modern scholars refer to him as Octavian to avoid confusion, and as Augustus after 27 BCE. Due to this division and the length and importance of Augustus' life, we have provided two articles, one on Octavian (from his birth to 27 BCE) and one on Augustus (27 BCE–14 CE).

The emperors are also denoted by their most familiar English and historical names rather than by their imperial names and official titles. Thus Caracalla (211–217) is best known by this nickname (he liked to wear a *caracallus* or Gallic hooded cloak) rather than his imperial name, Marcus Aurelius Antoninus, often abbreviated Antoninus in legal documents. Another Roman emperor, Antoninus Pius (137–161), is usually termed Antoninus Pius. A short-lived emperor, Antoninus Elagabalus (218–222), took the name of his god, El Gabal or Elagabalus, and is usually termed Elagabalus (older spelling Heliogabalus).

Less well known Romans are introduced with full tria nomina and then abbreviated to the cognomen when possible.

Dates and Dating

All dates in the articles in the Roman Section employ BCE (Before the Common Era) or CE (Common Era). This is a relatively new system, replacing the traditional BC (Before Christ) and AD (Anno Domini, “(in the) Year of our Lord”). In terms of the dating, “BCE” exactly equates to “BC” and “CE” to “AD.” Although becoming more widespread, the new system has not been universally accepted by ancient historians. This means that many of the titles of works in the Further Reading sections listed for the articles and in the Bibliography use the earlier BC/AD system.

The Romans themselves employed consular dating, for example, the year 63 BCE was “the year of Marcus Tullius Cicero and Gaius Antonius Hybrida,” who were both consuls during that year. Before 153 BCE, the consular year began in March and ended 12 months later in the following year, so dates before that time may be given as two-year dates, for example, 198/197 BCE, unless more precise information is available. The consular date system continued to be used during the imperial period, except that the emperor was often one of the consuls for the *n*th time. Consular dates are long and cumbersome and when used in the Primary Documents, they have been rendered as BCE/CE dates.

Abbreviations

The following abbreviations are used in the entries in the Roman Section of this encyclopedia.

Abbreviations of Classical Sources

A full list of abbreviations of classical sources is found in the *Oxford Classical Dictionary* (4th edition, 2012). In *Conflict in Ancient Rome*, ancient authors with multiple titles are cited by both author and title in the text. Ancient authors with only one title are cited by author name only in the text. Their titles are listed below:

Ammianus	Ammianus, <i>Res Gestae</i> (<i>History of Rome</i>)
CIL	Corpus Inscriptionum Latinarum
Dio	Dio Cassius, <i>Roman History</i>

Diodorus	Diodorus Siculus
Dionysius	Dionysius of Halicarnassus, <i>Roman Antiquities</i>
Gellius	Aulus Gellus, <i>Attic Nights</i>
Herodian	Herodian, <i>History of Rome</i>
<i>ILS</i>	<i>Inscriptiones Latinae Selectae</i>
Livy	Livy, <i>Ab Urbe Condita</i> (History of Rome)
Polybius	Polybius, <i>Histories</i>
<i>RGDA</i>	<i>Res Gestae Divi Augusti</i>
Valerius Maximus	Valerius Maximus, <i>Memorable Deeds and Sayings</i>
Velleius	Velleius Paterculus, <i>Roman History</i>
Zosimus	Zosimus, <i>New History</i>

Chronology of Conflict in Ancient Rome

753–510 BCE	Roman monarchy
509	First year of Republic
499/6	Battle of Lake Regillus
493	<i>Foedus Cassianum</i>
451	First Decemvirate
450	Second Decemvirate; overthrow of Decemvirs
406–396	Siege of Veii
390/87	Battle of Allia River; Gauls sack Rome
367	End of Patrician/Plebeian Conflict
343–341	First Samnite War
341–338	Latin War (revolt)
340	Battle of Veseris
326–304	Second Samnite War
298–290	Third Samnite War
295	Battle of Sentinum
280–275	War with Pyrrhus of Epirus
264–241	First Punic War
218–201	Second Punic War
214–205	First Macedonian War
218	Battle of the Trebia
217	Battle of Lake Trasimene
216	Battle of Cannae
209	Siege of New Carthage
207	Battle of the Metaurus
205	Roman invasion of Africa

202	Battle of Zama
200–197	Second Macedonian War
197	Battle of Cynoscephalae
196	Isthmian Declaration
171–167	Third Macedonian War
168	Battle of Pydna
149–146	Third Punic War
146	Destruction of Carthage and Corinth
134–133	Siege of Numantia
133	Tribunate of Tiberius Gracchus; death of Tiberius Gracchus
123–122	Tribunates of Gaius Gracchus
121	Death of Gaius Gracchus
112–105	Jugurthine War
107	Marius' first consulship; reforms of the army
105	Battle of Arausio
104–100	Marius' second through sixth consulships
102	Battle of Aquae Sextiae
101	Battle of Vercellae
91–87	Social War
88	Sulla's first capture of Rome
87–83	Sulla campaigns in Asia Minor and Greece
86	Marius and Cinna take over Rome; Marius' seventh consulship and death
82	Sulla's second capture of Rome
82–81	Dictatorship of Sulla; Proscriptions of Sulla's opponents
72–71	Revolt of Spartacus
67	Pompey given extended <i>imperium</i> against and defeats pirates
66	Pompey commands Mithridatic War
65	"First Catilinarian Conspiracy"
63	Catilinarian Conspiracy; Cicero, as consul, executes conspirators

62	Defeat of Catiline near Pistoria
60	First Triumvirate formed
58–50	Caesar's conquest of Gaul
49–45	Caesarian-Pompeian Civil War
49	Caesar invades Italy; campaign of Ilerda; Caesar's first dictatorship
48	Battle of Pharsalus; death of Pompey; Caesar's second dictatorship
47	Caesar defeats Pompeians at Thapsus; Caesar defeats Pharnaces at Zela
46	Caesar's Spanish campaign against Pompeians
45	Caesar defeats Pompeians at Munda; Caesar's third dictatorship
44	Caesar becomes "dictator perpetuus"; Caesar assassinated (15 March)
43	April Battle of Mutina August Octavian claims consulship November Second Triumvirate formed; Triumviral proscriptions
42	October Battles of Philippi (3 and 23 October); deaths of Brutus and Cassius
40–41	Perusine War
40	Treaty of Brundisium; Antony marries Octavian's sister Octavia
39	Pact of Misenum
37	Pact of Tarentum
34	Donations of Alexandria
33	Antony marries Cleopatra
32–31	War of Octavian and Antony
31	Antony defeated by Octavian at Actium
30	Suicides of Antony and Cleopatra
27	Augustus' "First Settlement"
23	Augustus' "Second Settlement"

13	Augustus reorganizes army
2	Augustus named “Pater Patriae”
9 CE	Varian Disaster
14	Death of Augustus; Rhine and Danube mutiny
14–37	Reign of Tiberius
19	Death of Germanicus
20	Trial of Cn. Calpurnius Piso
27–33	Tiberius retires to isle of Capri; ascendancy of Sejanus
31	Sejanus arrested and executed
37	Death of Tiberius
37–41	Reign of Gaius (Caligula)
41	Assassination of Gaius
41–54	Reign of Claudius
42	Revolt of Camillus Scribonianus
43	Conquest of Britain
54	Alleged assassination of Claudius
54–68	Reign of Nero
59	Death of Agrippina
64	Great Fire at Rome
65	Pisonian conspiracy; coronation of Tiridates
66–70	Jewish War
67	Execution of Corbulo
68	Revolt of Vindex and Galba
68–69	Reign of Galba
69	Reigns of Otho and Vitellius
	January Acclamation of Vitellius; usurpation of Otho; murder of Galba
	April First Battle of Bedriacum; defeat and suicide of Otho
	July Acclamation of Vespasian as emperor
	October Second Battle of Bedriacum; Flavians defeat Vitellians
	December Flavians take Rome;

	Vitellius murdered by populace
	Gallic Revolt begins
69–79	Reign of Vespasian
70	Vespasian takes control of Rome
	Suppression of Gallic Revolt
74	Siege of Masada ends in Judaea
79	Eruption of Mount Vesuvius
79–81	Reign of Titus
81–96	Reign of Domitian
	Dacian War
96	Assassination of Domitian
96–98	Reign of Nerva
98–117	Reign of Trajan
101–102	First Dacian War
105–106	Second Dacian War
114–117	Persian War
117–138	Reign of Hadrian
132–135	Bar Kochba Revolt
138–161	Reign of Antoninus Pius
161–180	Reign of Marcus Aurelius
166–173	Marcomannic War
161–169	Lucius Verus co-emperor with Marcus
169–180	Commodus co-emperor with Marcus
180–192	Reign of Commodus
192	Assassination of Commodus
193	Reign of Pertinax; Praetorians assassinate Pertinax; “auction of the empire”
	Reign of Didius Julianus; acclamation and revolt of Septimius Severus
	Didius Julianus is assassinated
	Severus takes control of Rome and dismisses Italian Praetorians
193–211	Reign of Septimius Severus
193–194	Severus’ civil war with Pescennius Niger
194–196	Severus’ Persian War

194–197	Severus' civil war with Clodius Albinus
197–198	Severus captures Ctesiphon
198	Severus makes Caracalla co-Augustus
211–217	Reign of Caracalla; Caracalla assassinates Geta
212	Constitutio Antoniniana
217	Assassination of Caracalla
217–218	Reign of Macrinus; revolt of Elagabalus
218–222	Reign of Elagabalus
222	Revolt of Alexander Severus; murder of Elagabalus
222–235	Reign of Alexander Severus
235	Revolt of Maximinus I; Alexander Severus is assassinated by his soldiers
235–238	Reign of Maximinus I
235–284	Conventional dates of third-century crisis; this list omits many minor emperors
238	Revolt of Gordians; Capellianus defeats Gordian II; Gordian I commits suicide Maximinus I forced to elevate Gordian III as Caesar; Senate elevates Pupienus and Balbinus Maximinus I assassinated by his soldiers
238–244	Reign of Gordian III
244–249	Reign of Philip
249–251	Reign of Decius; persecution of Christians; Decius killed in battle against Goths
251–260	Reign of Valerian and Gallienus Persecution of Christians
260	Valerian captured by Persians
260–268	Reign of Gallienus alone

268–272	Reign of Zenobia
268	Gallienus murdered by his officers
268–270	Reign of Claudius II Gothicus
270–275	Reign of Aurelian; reconquest of Palmyra
	Reconquest of Gaul
	Abandonment of Dacia
275	Aurelian assassinated by his officers
276	Reign of Tacitus
278–282	Reign of Probus
282	Probus assassinated by his soldiers/by praetorian prefect Carus
282–283	Reign of Carus
283–284	Reign of Numerian; Numerian dies under mysterious circumstances
284–305	Reign of Diocletian
286–305	Reign of Maximian
286–296	Revolt of Britain; reigns of Carausius (286–293) and Allectus (293–296); reconquest of Britain by Constantius
293	Elevation of Caesars Constantius and Galerius; First Tetrarchy
296–299	Tetrarchic Persian War; Peace of Nisibis
303–311	“Great” Persecution
305	Abdication of Diocletian and Maximian; Constantius and Galerius become Augusti; Maximinus II and Severus become Caesars
306	Death of Constantius I; Constantine I acclaimed at York
307	Revolts of Maxentius at Rome and of Maximian; defeat of Severus
308	Council of Carnuntum; Maximian abdicates for second time
310	Second revolt of Maximian; defeated and captured at Marseilles; commits

	suicide
311	Death of Galerius; end of “Great” Persecution
312	Constantine I defeats Maxentius in Battle of Milvian Bridge
313	Death of Diocletian; defeat and death of Maximinus II
313–324	Joint reign of Constantine I and Licinius
316–317	Civil war of Constantine I and Licinius
324	Civil war of Constantine I and Licinius; Licinius defeated, imprisoned
	Constantine I founds Constantinople
325	Licinius executed; Council of Nicaea
337	Death of Constantine I
337–340	Reign of Constantine II; defeated by Constans and killed in 340
337–350	Reign of Constans; assassinated by Magnentius in 350
337–361	Reign of Constantius II
351	Constantius II defeats Magnentius at Mursa
351–354	Constantius II elevates Gallus as Caesar; execution of Gallus
355	Constantius II elevates Julian as Caesar
357	Battle of Strasbourg; Julian acclaimed for first time
361	Julian acclaimed for second time at Paris; begins civil war with Constantius II, who dies from an illness before their armies clash
361–363	Reign of Julian
363	Julian’s Persian campaign; Julian wounded in battle and dies; officers

	select Jovian
363–364	Reign of Jovian; dies from suffocation by charcoal fumes
364–375	Reign of Valentinian I
364–378	Reign of Valens
367–382	Reign of Gratian; killed in mutiny
383–388	Revolt of Magnus Maximus
375–392	Reign of Valentinian II
378	Goths cross the Danube; battle of Adrianople; Valens dies in the battle
379–395	Reign of Theodosius I
392	Death of Valentinian II; revolt of Arbogast, who elevates Eugenius
394	Battle of the Frigidus; Theodosius defeats Arbogast and Eugenius
395	Death of Theodosius I; accession of Arcadius (eastern empire) and Honorius (western empire)
395–408	Dominance of Stilicho
407–409	Revolt of Constantine III
408	Death of Arcadius; downfall of Stilicho
408–450	Reign of Theodosius II (eastern empire)
410	Alaric captures Rome; abducts Galla Placidia
412–415	Alaric's brother Athaulf marries Galla; is assassinated
417–421	Constantius III marries Galla Placidia
419	Birth of Valentinian III
421	Reign of Constantius III (western empire, with Honorius)
423	Death of Honorius
423–425	Usurpation of Johannes; Galla and Valentinian III flee to Constantinople
425–455	Reign of Valentinian III (western empire); dominance of Galla Placidia

429	(425–437) and of Aetius (killed 454)
430s–451	Vandals occupy Africa
450–457	Dominance of Huns
451	Reign of Marcian (eastern empire)
	Aetius defeats Attila and the Huns at Châlons
454	Valentinian III assassinates Aetius
455	Valentinian III assassinated by Petronius Maximus
455–457	Reign of Petronius Maximus (west)
455–456	Reign of Avitus (west)
457–461	Reign of Majorian (west)
457–474	Reign of Leo (east)
461–464	Reign of Libius Severus (west)
467–472	Reign of Anthemius (west)
472	Reign of Olybrius (west)
473–474	Reign of Glycerius (west)
474–491	Reign of Zeno (east)
474–475	Reign of Julius Nepos (west)
475–476	Reign of Romulus Augustulus (west); deposed by Odoacer, who becomes king of Italy

A

Acclamation

Acclamation was the collective expression of statements or sentiments en masse by a group to a superior individual, such as a magistrate, commander, or emperor. It may be described as organized cheering, which today is practiced only by political demonstrators and professional sports fans at games, but which in the Roman world was a significant social and political phenomenon. Imperial acclamation, in which soldiers hailed a general or other leader as *imperator*, began as a republican custom associated with Roman victory and the triumph, but in the imperial period signified that the leader in question was claiming the rank of emperor.

Crowds might express their opinions or wishes through acclamation, chanting in unison especially at large gatherings such as the games, where they could express their approval or disapproval of policy without the risk of individual punishment. This practice also existed in the army, where it gave ordinary soldiers a voice. In the imperial period, the only way that the mass of the people could express their political sentiments was through mass cheering or derision. Even the Roman Senate addressed the emperor through acclamation. In a notorious example preserved in the *Historia Augusta*, after the death of Commodus, an emperor highly unpopular with the Senate, the senators chanted for the ritual humiliation of his corpse: “*unco trahatur*” (let him be dragged by the hook) (*Historia Augusta*, *Commodus* 18.5). The Senate’s acclamation of the publication of the Theodosian Code in 438, praising the measure and the emperor Theodosius II (408–450), fills many pages.

Acclamation should be distinguished from imperial acclamation, the creation of emperors by the army. Traditionally, Roman soldiers acclaimed

their victorious general as *imperator* (commander), a term that became closely associated with victory and the triumph. Imperial acclamations retained these features, but *imperator* now denoted the emperor (loosely, since Latin *imperator* might still be used in its traditional sense as “commander” or “general”). Caesar as dictator allegedly had the Senate bestow the title of *imperator* on him. Augustus was unable to defuse the spontaneous element, though he adopted *Imperator* as a *praenomen* (replacing his former praenomen Gaius), which was used again by Otho and Vespasian in 69 CE and became a permanent imperial title. Emperors were saluted as *imperator* after victories and recorded such instances in their titlature.

Acclamation may have been a formality in the successions (justified by dynastic relationship and already designated as successor) of Tiberius, Gaius (Caligula), and Nero. In the accession of the emperor Claudius (41–54 CE) and in the civil war of 69 CE, acclamation by the troops reappeared as a “live” form of transfer of the imperial power. After Gaius was assassinated, for a short time there was no authority in the palace; the praetorians allegedly ran through it, searching, and discovered Claudius hiding behind a curtain. They dragged him out and hailed him as emperor (Suetonius, *Claudius* 10). In January of 69, Vitellius was hailed as emperor by the troops of Lower Germany, and Otho was hailed by the Praetorian Guard. Tacitus depicts Vitellius’ acclamation as somewhat spontaneous, but Otho encouraged his with speech-making, bribery, and promises of future benefits. Vespasian was also acclaimed spontaneously by his troops in the Near East. Tacitus depicts the acclamation of Vitellius as a phenomenon of irrational crowd behavior, but that of Vespasian as due to his superior qualities as a leader.

As this summary shows, it became part of imperial ideology (emphasizing the legitimacy of a ruler) that he was acclaimed spontaneously by the army due to his ideal qualities rather than purchasing their support with payments or other promises. The ideal emperor might even attempt to refuse the imperial power when his acclaiming troops offered it, however unbelievable such stories now appear. It becomes uncertain whether some acclamations (especially of successful usurpers, who managed to hold onto their power and consolidate their rule) were actually spontaneous and not stage-managed or purchased. The later Roman emperors attempted to formalize salutation as *imperator* as a yearly ritual.

Achaean Revolt (146 BCE)

The Achaean Revolt occurred in 146 BCE and pitted several Greek states supporting the Achaean League against Roman armies in Greece. It resulted in Roman forces defeating the Achaean armies and destroying Corinth altogether. This began a new era of the Roman domination of Greece.

The roots of the Achaean Revolt lie in Roman flouting of Achaean League policy by entertaining Spartan ambassadors who sought help seceding from the League in the 180s, creating a precedent for other secessionist states (Polybius 23.9.13–14). The Roman victory at Pydna in 168 and consequent punishments and geopolitical rearrangements increased Roman expectations for Greek acquiescence to Roman wishes. In 164, the Senate upheld Pleuron's desire to secede, which Pausanias (7.11.2) saw as a Roman desire to dismember the League. However, the Senate also recognized the League's sovereignty in several matters of the period 168–146, and appeared ambivalent and unwilling to enforce its own wishes from time to time: hence, a consistent imperialist policy is hard to define from its actions.

In 147, when the League commenced military mobilization against secessionist members, a Roman ambassador informed the League that the Roman Senate desired neither Sparta, Herakleia, Argos, Corinth, nor Orkhomenos in Arkadia to remain as members. This sparked a murderous

anti-Spartan riot. Another embassy from Rome repeated the Senate's wishes, but popularizing Achaean leader Kritolaos stated that no decision could be made until the next League Assembly six months hence. He spent the meantime denouncing Roman interference (Polybius 38.11), preparing for war against Sparta, and enacting populist debt reforms, probably only temporary measures to maximize military participation, but surely inflaming some dissatisfactions regarding the economic status quo in Greece.

A Roman embassy appeared at the Achaean Assembly at Corinth in spring of 146, offering a final chance to acquiesce to Roman demands. This received jeers. Kritolaos, riding a wave of anti-Roman sentiment, denounced several Greek politicians as pro-Roman, proposed a decree giving Achaean generals monarchic powers, and declared war against Sparta, which, Polybius notes, meant war against the Romans (38.12.5). An Achaean army then traveled toward Herakleia to force its readmission into the League, but was surprised and defeated by a Roman army, killing Kritolaos. Another Achaean populist leader, Diaios, then freed 12,000 slaves and demanded Achaean women to sell their jewelry for the war effort; Polybius describes Greece as frenzied in anti-Roman sentiment (38.16.7).

The Roman army prevailed, entered Corinth, killed and enslaved its inhabitants, looted its artworks (Strabo 8.6.23) and destroyed it completely as a warning. After this, the Romans disbanded most Greek federal leagues and gave the governor of Macedon the power to interfere in Greece. Scholars regard this as the end of political freedom for Greece.

Why the Romans finally decided to act in the 140s after decades of ambivalent warnings is a key question. It is best answered by Roman desire to not countenance the Achaean League embarking on war against would-be secessionists in Greece precisely when the Romans were occupied with Andriskos' revolt in Macedonia and its aftermath.

Actium, Battle of (31 BCE)

The battle of Actium is one of the most famous battles in antiquity, a sea battle on September 2, 31 BCE in which the naval forces of Octavian and Agrippa defeated those of Antony and Cleopatra. Widely regarded as marking the end of the civil war, and with hindsight often seen as heralding the beginning of the Principate, it is also one of the most debated by scholars, dismissed by Sir Ronald Syme as "a shabby affair." Nevertheless, the idea of Actium as a crucial historical turning point developed in Roman times during the decade or so after the battle, and was firmly established by the end of Augustus' lifetime. Descriptions of the battle are distorted by hindsight and by the dominance of the historical record by the winning side.

The battle of Actium concluded a period of civil warfare that began with the assassination of Julius Caesar in 44 BCE, when his great-nephew and heir, Octavian, was only 18 years old. Antony, at one time Caesar's legate, became Octavian's sometime ally against the "Liberators," the assassins of Julius Caesar, and joined forces with Octavian in the Second Triumvirate (43 BCE). However, as their other enemies dropped away, Antony and Octavian emerged as rivals for the control of the Roman Empire. Octavian's forces were based in the western Mediterranean, Antony's in the eastern Mediterranean, where Antony allied with and conducted a long-term love affair with Cleopatra VII of Egypt. Before the battle of Actium, Antony was initially in the stronger position, supported by several hundred senators and by both consuls, as well as by various independent kings such as Alexander of Emesa and Adiatrix, Tetrarch of Galatia. However, his supporters fell away.

The battle took place near the promontory of Actium at the entrance to

the Ambracian gulf off the north-western coast of Greece. Octavian's naval forces were ably commanded by Agrippa, who had already shown his prowess in winning the naval war against Sextus Pompeius in 36 BCE. Despite debated naval skirmishes between the two sides in this region in the months leading up to the final battle, Antony's forces gradually became isolated and cut off from their supplies. Sickness may also have played a part in weakening his forces. These accounts of Antony's dwindling support may have been intended to glorify Octavian.

Octavian had, moreover, pursued a propaganda campaign in the lead-up to the battle, attacking Antony for his non-Roman loyalties in supporting the queen of Egypt. He had revived (or perhaps even invented) the ancient "fetial" rite of casting a spear onto land ritually denoted as foreign at the Temple of Bellona in Rome to reinforce the impression that he was declaring war against a foreign foe. By contrast, Octavian claimed in the *Res Gestae Divi Augusti* that he was leading the whole of Italy into battle: "The whole of Italy of its own accord swore an oath of allegiance to me and demanded me as its commander for the war in which I conquered at Actium" (RGDA 25). This propaganda campaign yielded fruit, with many important supporters deserting Antony before the battle.

In the battle itself, Octavian's forces, commanded by Agrippa, deployed perhaps 200 ships, while Antony and Cleopatra had only 170. The Antonian ships were larger, but Agrippa's smaller ships were faster and employed an artillery weapon known as the harpax, a grapple aimed by shipboard catapults at enemy vessels. In the accounts of the battle, intended to flatter Octavian, Antony's forces are depicted as lacking enthusiasm and as rapidly falling back when Antony signaled to Cleopatra to retreat. Antony soon followed Cleopatra's retreat, escaping with her to Egypt. Most of his fleet was lost or surrendered to Agrippa.

Many poets, such as Virgil, Propertius, and Horace, celebrated the battle not as part of a civil war, but as a war against foreigners, representing it as a struggle between the traditional gods of Rome against the exotic gods of Egypt, and the battle forms a memorable central scene on the shield of Aeneas in Virgil's *Aeneid*. The spectacle of a woman engaging in battle provoked moral outrage among Romans, and Antony was represented as being in thrall to the queen and her ill-assorted retinue of eunuchs. Virgil also invented a new etiology for the games at Actium, linking them to Rome's founder, Aeneas. The battle became iconic for the new regime, as

Octavian then gradually established himself as sole ruler of Rome, with some Hellenic cities redating their calendar according to an Actian era. Actium is often described as a crucial turning point in the civil war, but it was not in fact the decisive moment: the final capitulation only took place the following year in 30 BCE, at Alexandria, when both Antony and Cleopatra committed suicide.

Octavian commemorated Actium by founding a new city nearby, Nikopolis ("Victory City"), and dedicating spoils at the location where his troops had encamped, where he constructed a monumental altar to Actian Apollo. There was already a sanctuary to Apollo at Actium, leading to his adoption by Octavian as the deity presiding over the battle. A tithe of the different types of ships captured at Actium was dedicated to Neptune and Mars at the campsite memorial, where the prows of captured ships featured along a massive podium. He also established four-yearly Actian games there from 27 BCE, on the model of the Olympics. At Rome, the battle was celebrated on the middle day of the triple triumph of August 13–15, 29 BCE, even though victories in civil war could not qualify for a triumph. Some reluctance to accept the validity of the triumph is perhaps hinted at by an inscribed calendar, the *fasti Barberini*, which entirely omits the Actian day. The victory was, however, monumentalized by displaying the beaks of captured ships on the speakers' platform by the temple of deified Julius (Caesar). In 28 BCE, four-yearly victory games on a Greek pattern, with athletics, were instituted at Rome; these were the first games to be held there on a regular cycle, marking a new departure for Roman festival culture. From then on Actium was firmly established within the foundation myth of Augustus' reign.

Adlocutio

Speeches (*adlocutiones*, sg. *adlocutio*) made by generals to their troops are a regular feature of contemporary accounts of Roman warfare. Such speeches before battles served to inspire the troops, improve morale, and rouse the soldiers to attack the enemy. Thus Julius Caesar delivered an address to his troops before the battle of Pharsalus (Caesar, *Civil War* 3.90.1). The general's speech to his troops was a standard element in narrative histories, which often feature paired speeches by opposing leaders. Such an arrangement gave historians an opportunity for rhetoric, and invention is most plausible for barbarian enemy leaders' speeches which were surely in native languages (cf. the Caledonian leader Calgacus' speech, Tacitus, *Agricola* 30–32). Nonetheless, there is substantial nonliterary evidence for the Roman *adlocutio* in other political contexts.

Under the Principate, the *adlocutio* had political value for an emperor in allowing him to communicate directly with his soldiers. Imperial speeches took place on a designated platform whose location formed a key component of legionary camps. The concept of the *adlocutio* was sufficiently important to feature on the imperial coinage and on the reliefs of the Columns of Trajan and Marcus Aurelius. *Adlocutio* scenes showing the emperor addressing members of the praetorian cohorts were used under Caligula and Nero (coin issues *BMCRE* I p. 151 nos. 33–35, *RIC* I p. 111 no. 40; *BMCRE* I pp. 218–219 nos. 122–126, pp. 259–260 nos. 303–304). Hadrian issued a coin that showed him with a group of soldiers and the legend COH PRAET S C, which formed part of his wider coin series issued to the provincial armies (*RIC* II p. 457 nos. 908–911). Advertised through the wider circulation of coins, the *adlocutio* supported the propaganda of the imperial regime through evidencing the close relationship between the emperor and his soldiers.

The *adlocutio* allowed an emperor to communicate his political position to the assembled soldiers, which was particularly critical during periods of political instability. In Tacitus' *Histories*, Otho addresses the praetorians, his supporters in his coup from Galba, invoking their loyalty and the justice of his cause (1.37–1.38); he quiets their near-mutiny (1.83–1.84); after losing his

battle with the Vitellians, he urges his soldiers to accept an end to the civil war (2.47).

The speeches made by Hadrian to the various army units based in Africa in 128 CE were recorded in a shortened form on a monument sited on the parade ground of the legionary fort at Lambaesis (*ILS* 2487; 9133–9135). Unit pride was deliberately cultivated in the emperor's comments. In one section, he tells Viator, the commander of his horse guard, to perform on the parade ground of another unit rather than on that of the *ala* he has just seen train and who evidently need no such demonstration. By scrutinizing the training maneuvers of his soldiers, the emperor showed his interest in their affairs and his desire for military efficiency.

Cassius Dio describes the *adlocutio* of Marcus Aurelius to his Danubian troops when news broke of Avidius Cassius' revolt (Dio 71[72].24.1–26.4). The emperor began his oration by calling the troops "fellow soldiers" and proceeded to describe how the treachery of a friend (Cassius) had forced him into yet another war. He emphasized his reluctance to fight and claimed to be willing to surrender his power for the good of the State, but stated that Cassius would not permit this. The emperor compared Cassius' army unfavorably to his own and concluded by stating his wish to forgive the usurper. The speech is designed to persuade the soldiers that the emperor has no responsibility or desire for the inevitable bloodshed to follow.

Adrianople, Battle of (378 CE)

On August 9, 378 CE, Rome's eastern emperor Valens led his army out of their fortified camp to engage Gothic rebels and their allies about eight miles north of the city of Adrianople (Hadrianopolis). The emperor intended the coming battle to end the Gothic War that had started two years earlier because of Roman mistreatment of the Gothic *foederati* (barbarians allied with Rome) whom Valens had allowed to settle on Roman lands south of the Danube River. The Goths had been driven from their lands by the Huns. However, corrupt Roman officials denied them promised food supplies and local towns denied them entry and trade, driving the Goths to the edge of starvation. The emperor ignored their protests, triggering the Gothic revolt. The Thervingi Goths' King Fritigern commanded the Gothic army, but he was assisted by Alatheus and Saphrax, coregents of the Greuthungian Goths. They had joined Fritigern in early August, bringing mostly cavalry.

With approximately 15–21,000 troops under his command, including 5,000 cavalry, Valens enjoyed a numerical advantage. Moreover, most of his troops were combat veterans, his infantry was more heavily armored, and Roman armies to the west had defeated every Gothic force they engaged, albeit without gaining a decisive advantage in the war. Although Valens' generals urged him to await further reinforcements from western emperor Gratian, Valens decided to attack the Gothic camp, hoping to claim sole glory. He left the imperial administrators, treasury, and a legion in the Roman camp, taking approximately 10–15,000 troops to the battlefield. He reached the Goths' encampment after a grueling seven-hour march that left his troops disorganized, dehydrated, and fatigued. Warned of the Roman approach, the Goths had encircled their wagons atop a hill, converting their camp into a lager with the families, possessions, and supplies protected inside.

Stationing his infantry in front of the camp, Fritigern recalled his cavalry, which was out foraging. To buy time, he set fire to the fields along the Roman march route and upon the Roman army's arrival, initiated negotiations for a hostage exchange. The Roman troops waited impatiently in the hot afternoon sun. In the late afternoon, frustrated imperial troops attacked without orders or support. They were repulsed. The Roman left wing surged forward, reaching the wagon lager just before dusk. Unfortunately for Valens, the Roman cavalry fled as the Gothic cavalry

returned. The Goths attacked the Roman infantry's flank and rear, encircling them by dusk. The Romans retreated to the base of the hill, but their discipline collapsed as exhaustion set in. The troops dropped their shields. Rout ensued. The Gothic cavalry gave chase, slaughtering hundreds. The emperor and most of his senior leaders and staff were killed. Only about a third of the Roman army survived, inflicting a severe blow to the empire.

Adrianople is most significant for its long-term political and military impact. It did not trigger the empire's fall but did signal the beginning of its military decline. To make up for the immediate need for manpower, Valens' successor Theodosius I recruited barbarian peoples as allied forces serving under their tribal leaders, rewarding them by allowing them to settle within the empire. These clients were often unreliable and their settlement eroded the territorial boundaries of the empire. As parts of the empire were lost during the fifth century, the government was no longer able to recruit and tax these areas, causing further erosion. It is not clear that the Roman army proper (troops still recruited from citizens and trained in the Roman manner) was barbarized.

The main source for the battle of Adrianople is Ammianus Marcellinus' history of Rome, which describes the circumstances leading to the battle and the battle itself and ends with the aftermath.

Adultery (Political)

Adultery, previously a private matter, became a public (capital) crime in the early empire with the marriage legislation of Augustus (emperor 27 BCE–14 CE). Consequently, adultery with women of the imperial family became a form of sedition, seen in the downfall of the two Julias (the daughter and granddaughter of Augustus) and of Messalina, the wife of Claudius I (41–54 CE).

In the *lex Iulia de adulteriis* of 18 BCE, adultery became a public (capital) crime. As attested by later jurists, a woman apprehended for adultery was forced to divorce her husband, was prosecuted, and if convicted, lost part of her property, and was deported to an island. Her adulterous lover, if convicted, also lost his property and was deported to a different island. If the woman's husband or father caught the adulterous lovers in the act, they had the right to kill the woman and her lover if he was of low status. The husband who did not divorce his wife within a required time span could also be prosecuted.

In 2 BCE, Julia, the daughter of Augustus and Scribonia, was exiled for alleged adultery with numerous Roman aristocratic men (Velleius 2.100.2–5; Seneca, *De beneficiis* 6.32; Suetonius, *Augustus* 65; Dio 55.10.12–16). She was exiled to the small island of Pandateria (mod. Ventotene), off the Italian coast. One of her lovers, Iullus Antonius, was forced to commit suicide; others, all aristocrats with distinguished names such as Sempronius Gracchus, a Cornelius Scipio, an Appius Claudius, and Titus Quinctius Crispinus Sulpicianus, were exiled. Julia and her lovers were probably tried by Augustus himself; details are lacking. According to Cohen, Tacitus (*Annals* 3.24) depicts the exile of Julia to an island as harsher than the law on adultery warranted, because with Julia Augustus introduced the practice of deportation to islands.

The adultery of Julia was critical because of her importance to the Augustan succession. Julia was Augustus' only child; she had been married to Marcus Vipsanius Agrippa, Augustus' most trusted lieutenant, and then

to Tiberius (the future emperor, 14–37 CE). Julia's sons by Agrippa, Gaius and Lucius Caesar, were adopted by Augustus as his probable successors and were given numerous honors. Though the Principate was not a hereditary monarchy, and though the actual parentage of Gaius and Lucius was not questioned, Julia's adulteries endangered Augustus' quasi-dynastic succession model. As argued by Fagan for Messalina (below, Fagan 2002: 575–577), if marriage to the emperor's daughter promoted the stability of the imperial house, adultery with the emperor's daughter could be regarded as sedition, threatening imperial stability. At the very least, it brought disgrace and dishonor to the imperial family. Whether Julia's lovers were engaged in concrete plot(s) to overthrow the Augustan regime is much less clear, though it has been argued by numerous scholars, including Sir Ronald Syme. Due to popular outcry, Julia was permitted to return from Pandateria to the mainland (Dio 55. 13.1).

Julia's daughter, Julia the Younger, was also implicated in adultery, convicted of adultery with Decimus Junius Silanus (Tacitus, *Annals* 3.24; 4.7.4; Suetonius, *Augustus* 65). Her husband, Aemilius Paullus Lepidus, also fell to suspected conspiracy. Junius Silanus had family connections with the lovers of Julia the Elder, suggesting that the second episode of adultery continued the first Julia's conspiracy, though relatively little is known about it and even the exact date (around 8 CE) is uncertain. Levick argues that since Gaius and Lucius were dead by 4 CE, and Tiberius' succession to Augustus was assured, Tiberius and his mother Livia wanted to remove the Julian line (the direct descendants of Augustus) from the succession. Therefore the Julias were disgraced and exiled. However, Julia the Elder's daughter Agrippina was married to Germanicus, the nephew of Tiberius.

Valeria Messalina, the wife of Claudius I (emperor 41–54) committed adultery with Gaius Silius (Tacitus, *Annals* 11.26–38; Suetonius, *Claudius* 26, 29; Dio 60[61].31.1–5). In Tacitus' vivid account, Messalina and Silius celebrated a Dionysian wedding while Narcissus, one of the imperial freedmen secretaries, disclosed their crimes to Claudius and managed the suppression of the alleged conspiracy, even ordering Messalina's death without the emperor's permission. Ordered to commit suicide, Messalina hesitated out of cowardice and was killed by a praetorian. Claudius' lack of agency throughout is stressed by Tacitus. Whether Silius and Messalina intended a coup is also unclear; the ancient authors stress her excessive sexual desire rather than political ambition. Nonetheless, as with both

Julias, Messalina's sexual impropriety destabilized the imperial regime. Other depictions of imperial women's adultery (for example, Gaius banished his sisters Julia Livilla and Agrippina the Younger for adultery) probably have a similar import.

Adultery committed by male emperors or members of the imperial family, though often alleged by gossipy biographers such as Suetonius and the *Historia Augusta*, was not in itself regarded as destabilizing the imperial succession. In this respect, imperial and nonimperial adultery both observed a gendered double standard. However, an emperor's adultery with the wives of prominent subjects might give those subjects cause for disaffection from him and even for assassination.

Aedile

An aedile (Latin singular *aedilis*, pl. *aediles*) was a junior magistrate in the political system of the Roman Republic. His duties were primarily administrative and local to the city of Rome, but the aedileship grew in importance in the late Republic because aediles' expenditures on public amenities might assist their subsequent careers.

Aediles originated at the time of the first secession of the *plebs* in 494 BCE, created to assist the two tribunes of the plebs. Their duties at that time pertained to the temple (*aedes*) of Ceres on the Aventine. These early aediles

were members of the plebeian order. Later, ca. 367 BCE, the Senate created two more aediles, termed curule aediles and drawn from the patrician order. Plebeian aediles were elected by the *concilium plebis*, curule aediles by the *comitia tributa*. Presumably the Senate regarded the administration of city life as too important to be monopolized by representatives of the *plebs*.

Aediles did not possess *imperium* or the power to wield force. They had no military duties. They supervised public works and amenities in the city of Rome itself, including streets, water, sewers, the grain supply, markets, firefighting, funerals, and gladiatorial games. Aediles also served as prosecutors of certain public crimes, defending the people's interests.

In the *cursus honorum* the aedileship ranked above the quaestorship and below the praetorship, but was not an essential step. However, in the late Republic, young politicians exploited the aedileship as an opportunity to spend lavishly on the games and other public amenities, to make a favorable impression on the populace and win future votes. The aedileship waned in importance in the Principate but continued to exist.

[Aemilius Paullus, Lucius \(ca. 228–160 BCE\)](#)

Lucius Aemilius Paullus is most famous as the victor of the Third Macedonian War, which consolidated Rome's domination over Greece and Macedon. A commander in the Second Macedonian War, he was praetor in 191 BCE, a command extended through 190–189. He participated in the commission that imposed peace terms on the Seleucid monarch Antiochus III after the Peace of Apamea (188 BCE). He was subsequently elected consul 182, commanding a war against the Ligurians, a people of the modern northwestern Italian coast who stubbornly resisted Roman conquest.

Aemilius Paullus was elected consul for 168, taking command of the Third Macedonian War from allegedly incompetent predecessors. He defeated Perseus of Macedon in the battle of Pydna and took Perseus prisoner, selecting from the booty of Pydna only Perseus' library. The subsequent triumph of Paullus was marred by the death of his two younger sons from illness.

Aemilius Paullus was also best known for his family connections. He had four biological sons; the two older sons were adopted by the Fabii Maximi and the Cornelii Scipiones, becoming, respectively, Quintus Fabius Maximus Aemilianus and Publius Cornelius Scipio Aemilianus (born 185/4). Fabius Aemilianus and Scipio Aemilianus retained a close relationship with Aemilius Paullus, whose sister Aemilia was the widow of Scipio Africanus (the Elder). Africanus' elder son Publius had no sons and adopted Scipio Aemilianus before dying prematurely.

Aemilius Paullus was elected censor in 164 and died of natural causes in 160. He was very highly regarded in his time as a moral exemplar and philhellene, views probably promoted by the historian Polybius, Paullus' friend and client, and persisting in Plutarch's biography of Aemilius Paullus. However, after Pydna, Paullus imposed the punitive sack of 100 cities in Epirus (an area of northern Greece) for supporting Perseus. The tradition dissociates Paullus from such brutalities, but modern historians have expressed greater skepticism.

Aerarium Militare

A state treasury founded by the Roman emperor Augustus, probably at the

time of his other army reforms in 6 CE, to provide Roman military veterans with discharge pensions.

In the traditional Republic, Roman veterans had not needed pensions, because they were recruited from small property owners known as *assidui*. This property qualification was established by the ancient Servian constitution. The number of recruits able to meet this property qualification declined through the second century BCE, and Gaius Marius took the step of enrolling recruits from the landless (*capite censi*). Such men were dependent on the army and the Roman state for pay and whatever benefits they received.

Accordingly, the benefits of veterans were a source of repeated conflict in the late Republic, especially when successful generals who achieved political dominance, such as the dictator Sulla, confiscated land from their political enemies to give to their veterans. The Second Triumvirate (Octavian, Mark Antony, and Lepidus) also confiscated land from their enemies to reward their veterans. Pay, rewards, and benefits were also often causes of mutinies in the late Republic, as when, after their defeat of Pompey, Caesar's legionaries mutinied demanding back pay and discharge.

To reduce a source of mutiny and political conflict, Augustus created the *aerarium militare* or military treasury, funded by the *vicesima hereditatium* or a five percent tax on inheritances and by a one percent tax on auction sales. He capitalized the treasury with 170 million sesterces of his own money (*Res Gestae Divi Augusti* 17). A legionary veteran received 12,000 sesterces upon discharge; praetorians received 16,000. Initial experiments with the purchase of land for veterans were discontinued in the early empire as unpopular.

However, ca. 5 CE Augustus also lengthened the period of legionary service to 16 years plus five years in reserve and then to 20 years plus five years in reserve. It is likely that the extension of service was intended to reduce the expenditure of the *aerarium militare*; the longer soldiers served, the more likely they were to die before their discharge, so there would be fewer veterans requiring discharges. Legionaries in the 14 CE mutinies complained about the extended period of service. Later in the first century CE, legionary service was extended to 25 years, and soldiers were discharged every two years, probably also to reduce the burden on the *aerarium*.

Auxiliaries served 25 years and probably did not receive cash pensions.

Aetius (d. 454 CE)

Flavius Aetius was supreme commander (*magister utriusque militiae*) of the western Roman army between 434 and 454. According to contemporary sources, he spent his youth as a hostage among both Visigoths and Huns, where he learned native fighting techniques and horsemanship. Aetius then joined the Roman army as a member of the imperial guard, though little is known of his early career. During the reign of the western usurper Johannes (423–425), Aetius was instructed to recruit an army of Huns. However, he arrived in Italy three days after the eastern Roman army had already defeated and executed Johannes. After an inconclusive battle with eastern forces, a compromise was negotiated in which the Huns were paid and sent back to Danubian territory.

In return, Aetius received a generalship in Gaul (first as *comes*, later as *magister militum per Gallias*). Between 425 and 431, he campaigned annually against the Visigoths and Franks in Gaul, and the Alamanni in Noricum. During this time Aetius was able to foster strong ties with the local aristocracy and pacify the left bank of the Rhine frontier.

Aetius' rise to the supreme generalship (*magister utriusque militiae*, Master of Both Services) was marked by alleged intrigue and conflict. Galla Placidia, the daughter of Theodosius I and sister of the emperor Honorius (d. 423), ruled as regent for her son Valentinian III. She did not like Aetius and favored Boniface, the *comes Africae*. In 430, Aetius assassinated Felix, the western Roman supreme commander, allegedly after hearing rumors of a plot against his own life. Galla Placidia was forced to grant the supreme

command to Aetius, but the next year she recalled Boniface from Africa. Aetius was cashiered, while Boniface marched against him. Both warlords engaged each other at Rimini during the winter of 432. Aetius lost the battle, but may have personally wounded Boniface who died shortly afterward. Fleeing to Pannonia, Aetius was able to enlist Hunnic aid and returned to Italy with this new army in 433. He persuaded Galla Placidia to restore his command, after which he became the most powerful man in the imperial west.

Between 435 and 440, Aetius campaigned in Gaul and inflicted a crushing defeat on the Burgundians and fought a major war with the Visigoths. As seen before, his most successful tactic was to employ Hunnic troops as federates. During the war with the Visigoths, most of his Hunnic auxiliaries were slaughtered, and it is likely he received no further Hunnic aid afterward. After the Vandal capture of Carthage in 439, the western Roman Empire lost its major source of tax revenue, the grain-producing province of Africa, depleting the troops available. The western Roman army rarely campaigned during the 440s, but Aetius did enact a policy of resettling diverse barbarian auxiliaries in Gaul, such as the Burgundians near the Rhône and Alans at Orleans and Valences. This strategy helped Aetius gather the necessary manpower for the battle of the Catalaunian Plains in 451, a significant battle in which Aetius' Romans and his barbarian allies, including the Visigoths, defeated the Huns.

Aetius was unable to stop Attila's invasion of Italy in 452. After the latter's death in 453, Aetius wished to strengthen his influence over Valentinian III by having his son marry the emperor's daughter. However, allegedly persuaded by the courtier Petronius Maximus, Valentinian III stabbed Aetius at Ravenna on September 21, 454. Valentinian III himself was assassinated by Petronius Maximus the following year.

Aetius belonged to a line of supreme commanders, such as Arbogast and Stilicho, who dominated the western Roman court. He retained his power far longer, due to his independent control over armed forces at a time the imperial state's central authority was progressively diminishing.

Africa

Except for brief explorations, the classical world's knowledge of Africa was restricted to modern North Africa, above the Saharan Desert. In particular, "Africa" refers to the heartland of the Carthaginian Empire, Africa Vetus or "Old Africa," reorganized by the Romans as a province, Africa Proconsularis. However, the entire North African region, from modern Morocco to modern Libya, might also be regarded as Africa. The Romans regarded Egypt as a separate region.

The Carthaginians, originally from Phoenicia, colonized North Africa and established their seagoing commercial empire centering on the area of modern Tunisia, with the great city of Carthage at its tip, which flourished during the sixth to second centuries BCE. In the Third Punic War, the Roman destruction of Carthage in 146 BCE ended the Carthaginian state. The remaining significant regional power was the kingdom of Numidia until its defeat in the Jugurthine War and its annexation after the battle of Thapsus.

In the late Republic and Principate, the Romans recolonized Africa Vetus and reorganized it as the province of Africa Proconsularis, governed by a proconsul. Numidia was held by the legate of the Legio III Augusta, the only legion in the entirety of Africa, but did not become a separate province until 196 CE. In the 40s, the emperor Claudius added the provinces of Mauretania Caesariensis and Mauretania Tingitana (roughly modern Morocco). These provinces were subdivided in the Diocletianic reorganization of the provinces.

In the Carthaginian and Roman period, North Africa was more agriculturally productive than it is today due to extensive irrigation, and was the second largest supplier of grain to the Roman Empire, after Roman

Egypt. North Africa was highly urbanized and produced one emperor (Septimius Severus, 193–211 CE) and many notable Latin intellectuals, including the orator Cornelius Fronto, the novelist Apuleius, and St. Augustine. Africa became highly Christianized by the third and fourth centuries CE.

The Vandal invasion and occupation in 429 onward severed the African provinces from the Roman Empire, crippling the western empire economically. The Byzantine emperor Justinian (527–565) attempted the reconquest of Africa from the Vandals. A North African culture that had merged native, Punic (Carthaginian), and Roman and Christian elements was finally submerged by the Arab conquest in the seventh century CE. However, due to the arid climate, many classical urban and villa sites in North Africa are remarkably well preserved today, as are many Latin inscriptions.

Agricola (40–ca. 93 CE)

The career of Gnaeus Julius Agricola is one of the most well known of all members of the Roman imperial administration. This is due to his biography, which was written by his son-in-law Cornelius Tacitus and provides an unparalleled insight into the activities of a Roman provincial governor. Agricola is the only known senator to have held all of his military posts (tribune, legionary legate, and governor) within the same province (Malone 2006, 76). His seven-year tenure of the governorship of Britain is also one of the longest on record.

Gnaeus Julius Agricola's family came from Forum Julii in Gallia Narbonensis. He was born on June 13, 40 CE. Agricola's father, Julius Graecinus, was executed under the emperor Caligula. The young Agricola

was educated in Massilia where a youthful infatuation with philosophy (sometimes associated with elite dissidence) was suppressed by his mother (Tacitus, *Agricola* 4).

Agricola served as a military tribune in Britain under the command of Suetonius Paulinus during the Boudiccan Revolt (60/61 CE). Tacitus praises Agricola's conscientious attitude toward his military service, in contrast to the majority of his peers (Tacitus, *Agricola* 5). It is possible that Agricola met the future emperor Titus during this period, as Titus served as a tribune in Britain shortly after the Boudiccan Revolt. On returning to Rome, Agricola was elected to the quaestorship in 62 CE. At the same time, he married Domitia Decidiana, who soon bore him a daughter. In 63–64 CE, Agricola served as quaestor in Asia. On returning to Rome, Agricola's political career continued smoothly. He became tribune of the plebs in 66 CE and obtained the praetorship two years later.

In late March or early April, 69 CE, rampaging Othonian soldiers murdered Agricola's mother and looted much of her estate at Intimilium in Liguria (Tacitus, *Agricola* 7). Perhaps in light of this crime, Agricola became an early adherent of the Flavian cause. He was initially tasked by Mucianus with recruiting troops to secure the new regime. Shortly afterward, he was dispatched to Britain to take command of the XX Legion, which had a reputation for poor discipline. Under the command of Petilius Cerialis, he took part in a number of campaigns in the territory of the Brigantes.

Agricola returned to Rome in 73 CE and was appointed to the governorship of Aquitania by the emperor Vespasian. Agricola was elevated to the consulship in 76 CE. His daughter married the future historian Tacitus shortly afterward.

In 77 CE, Agricola arrived in Britain as provincial governor. His first campaigning season was focused on fighting the Ordovices and imposing control over north Wales and Anglesey, thus completing the task begun by his former superior Suetonius Paulinus prior to the outbreak of the Boudiccan Revolt. The attack on Anglesey utilized the element of surprise by using auxiliary troops to swim across to the island rather than relying on the fleet. The following winter was spent on addressing corruption within the provincial administration. Agricola ensured that only trustworthy candidates were appointed and reformed the taxation system to introduce a fairer quota for the provincials.

Agricola's second campaigning season was conducted on the edge of

Roman territory in southern Scotland where, according to Tacitus, his raids and impressive camps forced the tribes to sue for peace. By winter, Agricola focused on encouraging civilian development. He encouraged the construction of public and private buildings in the Roman style (Tacitus, *Agricola* 21). Agricola also promoted the education of the sons of tribal chiefs as a means of ensuring their future loyalty to Rome.

The following three campaigning seasons saw continuing advances made in Scotland. By 80 CE, the Forth-Clyde line was held by Roman garrisons, providing a suitable frontier from which to launch further expeditions, including the crossing of the Clyde the following year. If Tacitus is to be believed, Agricola also considered an invasion of Ireland. He offered refuge to a fugitive Irish prince in the hope of utilizing him at a future date. Tacitus (*Agricola* 24) records that Agricola would later claim that Ireland could be conquered and held by a single legion and accompanying auxiliary troops.

The summer of 82 CE witnessed a major revolt by the Caledonian natives against Roman authority, which culminated in a daring night assault on the camp of the IX Legion. Although the attack was repulsed, it was clear that Agricola would need to deal decisively with the Caledonian resistance. In 83 or 84 CE, Agricola defeated a force of over 30,000 Caledonians at Mons Graupius in a victory which was to prove the climax of his campaigns (Tacitus, *Agricola* 35–37).

The emperor Domitian rewarded Agricola with triumphal ornaments and a public statue. Tacitus claims that Domitian was jealous of Agricola's military prowess and devised an elaborate plan to lure Agricola from Britain with the promise of the prestigious governorship of Syria (Tacitus, *Agricola* 40). This proved unnecessary, as Agricola left the province of his own accord. On his return to Rome, to avoid Domitian's further displeasure, Agricola spent his final years in retirement. Agricola probably died in 93 CE.

Any understanding of the life and career of Agricola is reliant upon the account written by Tacitus. This is problematic as the *Agricola* is not simply a biography. It also has a political message in that good men may do good deeds even under bad emperors (Tacitus, *Agricola* 42). Tacitus clearly admired his father-in-law and this necessarily obscures the historical reality. In the past, scholars have been quick to use the *Agricola* as a definitive source for Roman Britain in the first century CE and have linked archaeological sites in southern Scotland to events described within the text.

Recent archaeological research has instead indicated that Agricola's successes may have been less spectacular than those of the earlier governor Petilius Cerialis.

Agrigentum, Battle of (261 BCE)

The battle of Agrigentum (mod. Agrigento, Sicily) was the first major confrontation of the First Punic War (264–241). The strategically positioned Greek city, on the southern coast of Sicily, had allied itself with Carthage in 264 and by 262 it had become their chief base. It controlled the major routes of the region and was important to any potential Carthaginian advancement into Italy. The Romans, who were expanding southwards, were determined not to allow further infringement. A number of diplomatic efforts between the belligerents failed to defuse the mounting tensions, and with Carthaginian forces gathering apace, the Romans dispatched the new consuls Lucius Postumius Megellus and Quintus Mamilius Vitulus at the head of 40,000 troops. In charge at Agrigentum, was the Carthaginian commander, Hannibal Gisco, who controlled a small garrison there.

Details of the conflict are sketchy, but it took the form of a double siege followed by a battle. Hannibal remained in the city while the Romans took advantage and began a blockade constructing ditches to starve the city into

surrender. During the standoff, lasting five months, Hannibal requested reinforcements from Carthage. Another Carthaginian commander named Hanno arrived at the head of some 30 to 50,000 troops and began to lay siege to the Roman camp. The face-off lasted a further two months with both factions fearing starvation, but the Romans were able to rely on their ally, Hiero II of Syracuse, for much needed supplies and Hanno was forced to submit to battle. Hanno was defeated and the Romans sacked the city selling the population into slavery.

The taking of Agrigentum was crucial for Rome at this juncture of the war but short-lived as the Carthaginians retook it in 255. However, from there they were able to control their supply lines, and it also gave them the impetus to further their attentions abroad.

Agrippina I (d. 33 CE)

Born ca. 14 BCE, Agrippina I was the daughter of Marcus Vipsanius Agrippa and the elder Julia, Augustus' daughter. In 4 CE, Agrippina married Germanicus. Fulfilling the expectations of a traditional Roman marriage, Agrippina gave birth to nine children, six of whom grew to adulthood. Most notable among her children were the future emperor Gaius (Caligula) and Agrippina II, mother of the emperor Nero. The life of Agrippina the Elder was marred by conflicts with members of the imperial household over the issue of dynastic succession. Tacitus describes Livia's and Tiberius' contempt as unjust, but Agrippina was not immune to Livia's taunts.

Agrippina accompanied Germanicus to his posts in Germany and Syria. Tacitus relates several incidents in which her behavior won popular support. When Germanicus unsuccessfully attempted to quell a mutiny among the troops in Lower Germany in 14, it was only the pregnant Agrippina's departure from camp, along with their son Caligula and the wives of other Roman officials, which ended the mutiny (Tacitus, *Annals* 1.40). In 15, her decisive action prevented the destruction of a bridge over the River Rhine at Vetera (Xanten) and preserved an escape route for Roman soldiers fleeing the army of German rebel Arminius. Agrippina herself stood on the bridge, praising and thanking all who crossed it, and doling out food, clothing, and medicine (Tacitus, *Annals* 1.69). Tacitus relates that Tiberius, hearing of Agrippina's actions, feared her influence over the troops and saw her as a potential threat to his power, claiming the prerogatives of a commander.

When Agrippina accompanied her husband to Syria, Tacitus notes that Tiberius and Livia continued to harass the couple. Tacitus alleges that Piso, the provincial legate of Syria, was certain that his posting to the province was to check Germanicus' ambitions and that Piso's wife Plancina had received instructions from Livia to persecute Agrippina. Plancina also took part in cavalry exercises and military maneuvers. Thus she failed to observe *decora feminis*, behavior fitting for good women, thereby incurring Tacitus' disapproval (*Annals* 2.55). On October 10, 19, Germanicus died, probably of natural causes but allegedly poisoned by Piso and Plancina.

Marble bust that may depict Agrippina the Elder (17 BCE–33 CE), wife of Germanicus (d. 19 CE) and mother of Gaius (Caligula) (emperor 37–41 CE). This bust may be a copy of the early imperial original. Located in the Capitoline Museums, Rome, Italy. (Araldo de Luca/Corbis)

Upon her return to Rome, amidst extreme public grief for the popular Germanicus, Agrippina was further entangled in the politics of the imperial household. Tacitus notes that Livia and Tiberius were absent from all public manifestations of grief for Germanicus. The grieving people spoke of Agrippina as the glory of the country, the sole surviving offspring of Augustus, and a singular example of ancient virtue; they prayed that her children might survive their oppressors. Tiberius, Tacitus notes, was deeply troubled by these expressions of public sympathy. At about this time, Sejanus, Tiberius' unprecedentedly powerful praetorian prefect, began to use Agrippina's celebrated virtues against her. Rather than being a faithful

wife and exemplary mother, he alleged, she was arrogant for having produced so many children, and dangerous for encouraging factionalism. He charged her with inciting civil war by promoting her children for dynastic succession. A number of Agrippina's friends were prosecuted in the trials for *maiestas*, treason, which plagued Rome after Tiberius left the city for Capri in 26, handing matters of state to Sejanus.

Sejanus launched his final attack on Agrippina after Livia's death in 29. Tacitus reports that Tiberius sent a letter to the Senate, denouncing Agrippina for her haughty language and arrogant spirit, and her son Nero for depravity. Despite tremendous public outcry for Agrippina and Nero, Tiberius repeated his accusations and rebuked the people for their resistance to his wishes. Although there is no information in the accounts of Tacitus and Dio about the subsequent trials, Agrippina and Nero were declared *hostes*, public enemies, a verdict that implies a charge of political misconduct. Nero was exiled to Pontia, where he died of starvation, and Agrippina to the island of Pandateria. There, according to Suetonius, she lost an eye when she was severely beaten by a centurion. In 33, Agrippina died, allegedly as the result of a self-imposed hunger strike despite attempts to force-feed her. Tacitus, however, suggests that food may have been withheld from her, and that her death was made to appear a suicide.

Agrippina II (d. 59 CE)

Agrippina the Younger was an important member of the Julio-Claudian family: descendant of Augustus, sister of Caligula, wife of her uncle the emperor Claudius, and mother of the emperor Nero. She spent her childhood with her great-grandmother Livia, from whom she may have learned to gain and retain supporters and eliminate enemies. Agrippina witnessed the forced exiles and violent deaths of family members who were victims of disputes over dynastic succession, casualties of treason trials, and assassinated rulers, crazed by their own power and paranoia. Nor was she immune to such dangerous people or circumstances herself, as she, too, suffered exile and, eventually, assassination.

Agrippina's intelligence, political shrewdness, and ambition were remarkable, although not surprising for someone of her position and lineage. That it was a woman who acted on these characteristics, however, historians could not forgive. Their rhetorical strategies allege her inappropriate interference in politics, manipulative use of her sexuality (both extending and withholding favors), excessive jealousy and cruelty, greed for power and possessions, and even a reputation as poisoner and murderer. These insinuations criticized and discredited the by-then unpopular Julio-Claudian dynasty, whose last ruler was Nero.

Throughout her life, perhaps drawing on her own experience as daughter of the popular commander Germanicus, Agrippina supported soldiers and veterans. Her mother was pregnant with Agrippina at the time of the Rhine mutiny. In 17, Agrippina and her siblings participated in Germanicus' triumph at Rome. In 50, the year after Agrippina married Claudius, he adopted her son Nero from her first marriage, and Agrippina arranged for the establishment of a colony of veterans in the place of her birth, Ara Ubiorum, now known as Cologne, Germany. The colony was named for both Agrippina and Claudius: *Colonia Claudia Ara Augusta Agrippinensium*. In 51, Claudius dedicated at Rome a triumphal monument

celebrating his British victory. The defeated British chieftain Caratacus, his wife, and his brothers, paid homage not only to Claudius, but also to his wife, Agrippina. According to Tacitus, that a woman should sit in state before Roman standards was an innovation without precedent. When Nero came of age that year, the occasion was recognized by a donative, a bonus awarded to the troops, among other measures Agrippina had suggested to gain popular support.

Agrippina seems to have been sensitive to the military's potential for abuse of power in the provinces. Josephus credits her with having interceded on behalf of the Jewish people, when they rebelled against the abusive treatment of a Roman centurion. She was especially concerned to ensure the loyalty of the Praetorian Guard, perhaps because she recognized the value of her parents' popularity among the troops, and the means by which Claudius succeeded Caligula when the praetorians proclaimed him emperor. After her marriage to Claudius she sought the removal of the praetorian prefects who had remained loyal to Claudius' executed wife Messalina and appointed Afranius Burrus as the new praetorian prefect. In 59, Nero decided to have his mother assassinated. The praetorians refused, leaving the task to members of the Roman naval fleet at Misenum.

Alae

An *ala* (Latin, pl. *alae*) is the term for a Roman cavalry unit as well as the formation of cavalry attached to a legion in battle. The term derives from the Latin word for “wing.” This was mostly due to the cavalry’s look in relation to the rest of the unit and its role in battle formations. The cavalry normally was positioned at both sides of the infantry in an elongated line that flowed backward and forward to ward off or encircle the enemy as needed. As the *alae* looked and moved like a bird’s wings, this name was applied to them.

Each *ala* was composed of 16 *turmae*. Each *turma* was composed of 32 troopers. This gave one *ala* a strength of 512 men. It was also not uncommon to find Roman cavalry formed into *alae milliariae*. These were double strength *alae* composed of up to 32 *turmae* each and having a strength of approximately 1,000 men.

Each *turma* was led by a decurion. Each *ala* was led by a *praefectus alae* or *praefectus equitum*. The exact difference between these two ranks is unknown. It is thought that they are actually the same office. The *praefectus equitum* is the older of the two, being common throughout the republican and triumviral periods, and the term *praefectus alae* came into existence during the early imperial period. This switch also coincided with the use of names and numbers to signify specific cavalry units (i.e., *praefectus alae Gallorum V* would be the *praefectus equitum* of the fifth cavalry unit composed of Gauls). Prior to this, it is thought that cavalry units were known by the name of their commander and changed names when they changed commanders. While there are some examples of non-Romans in these leadership roles, these offices were most often held by Roman citizens. The title indicating the ethnic composition of an *ala* refers to its original recruitment when first formed and does not necessarily indicate its ethnic composition in a later period.

Alae Sociorum

The *alae sociorum* (sing. *ala*) were troops raised by the Italian peninsular city-states in permanent alliance with Rome, from the early Republic down to the Social War (91–87 BCE). Each year when Rome levied a new consular army, the Italian allies, or *socii*, were expected to raise an equivalent amount of troops. Each consular army was traditionally composed of two Roman legions. As a result, the *socii* raised an additional two *alae*, giving each consul a total force equating four legions.

Each *ala sociorum* was the same size as a Roman legion, approximating 5,100 total men under arms. Only about 4,200 were infantry, however. The *socii* were expected to provide more cavalry than the standard Roman legion did: for example, 900 horsemen per legion instead of 300. However, the proportion of troops and of infantry vs. cavalry were probably negotiated with each allied community. Since most allied communities had problems raising this amount of manpower on their own, several communities may have banded together to outfit each *ala*. Allowances were also made for communities famed for producing one type of soldiers (specifically cavalry) to provide more cavalry and less infantry. The manpower obligations of each allied community or group of communities were recorded in a document known as the *formula togatorum* (identified with the *lex agraria* of 111 BCE).

The command of each *ala sociorum* was given to as many as six *praefecti sociorum* chosen from the equestrian order of Roman citizens by the consul in charge. All cavalry in the army was usually detached from the parent legions and placed under a *praefectus equitum*, who was usually of senatorial rank.

In addition to raising these troops, the *socii* were expected (after the early Republic) to equip them in the same manner as a Roman legion and provide them with basic rations for the initial part of the campaign season.

Their support would be the responsibility of the Roman general from that point on, as for the Roman legions. In exchange for fighting, the *alae sociorum* would receive a percentage of any loot gained, although at a lower rate than the Roman soldiers received. It is also thought that serving in a campaign would result in the awarding of Roman citizenship to the *socii* soldiers, or at least an increase in status to *ius Latini* (the legal rights of a Roman citizen).

This practice is thought to have originated in the early portion of the fifth century BCE with the Treaty of Cassius (*foedus Cassianum*). It was maintained throughout the republican era until Rome granted full citizenship rights to the *socii* at the end of the Social War in 87 BCE.

The name “ala(e)” is applied to these troops for the same reason it is applied to cavalry formations. They flanked the main Roman troops, like the wings on the body of a bird. While cavalry did make up a component of these formations, almost all *alae sociorum* were mixed cavalry and infantry and not to be confused with standard Roman cavalry *alae*, which were purely horsemen. The latter are best known as the Roman auxiliary cavalry in the Principate.

Alaric (Ruled ca. 400–410 CE)

Leader of the Visigoths, Alaric was one of the most ambitious barbarian leaders to take advantage of the relative power vacuum in the western Roman Empire due to the emperor Honorius' weak leadership. Theodosius I (379–395) promoted the widespread use of barbarian federates (allies) as troops; the minority of his sons resulted in the dominance of military policy by the *magistri militum* or senior generals. The chief of these was Stilicho, who was virtually a regent for Honorius until his own downfall in 408. Alaric ensured his historical notoriety by besieging and sacking Rome in 410 CE, though he achieved no lasting benefit.

Very little is known about Alaric's family or youth. Sixth century historiography, as preserved by Jordanes and probably derived from Cassiodorus, imagined him as descending from a Gothic clan with royal pedigree. However, contemporary sources indicate that Alaric started as an obscure figure serving in the eastern Roman army. He originally commanded a unit of Gothic auxiliaries in Theodosius' army during the battle of the Frigidus. After Theodosius' death, he was dismayed that he did not receive a proper generalship as a reward for service. Gothic resentment was high considering the heavy casualties their ranks had suffered during the battle. Alaric was able to exploit these grievances to raise a mutiny in 395, which rapidly spread across Thrace. The Balkans were virtually defenseless, since the eastern forces were still under Stilicho's command in Italy. When the latter tried to attack Alaric in Greece, his forces displayed poor discipline, and the court in Constantinople forced Stilicho to return the eastern units and vacate Greece. Alaric continued pillaging Attica and the Peloponnese, until Stilicho returned with a new force in 397. Some fighting occurred in the peninsula, but Stilicho was forced again to withdraw after Constantinople declared him a public enemy. In return, Alaric was allowed to retreat into Epirus and received the senior generalship of the eastern army in Illyricum (*magister militum per Illyricum*). He held this post until 400, when he probably had to relinquish it in the aftermath of a failed coup by a different Gothic general in Constantinople. Alaric then decided to invade Italy in 401. This may have been the first occasion that he took on the title of king, but his ultimate goal still remained a senior generalship in the Roman army. He entered Italy virtually unopposed and was able to besiege Milan for several months, until Stilicho descended upon him with his forces from Raetia. Two stalemate battles were fought at Pollentia and Verona, but Stilicho ultimately held the upper hand and was able to capture Alaric's family and baggage train. Alaric lost a significant number of men through battle, hunger, disease, and desertion, but still retreated with a considerable force into western Illyricum.

By 405 at the latest, Stilicho granted him a western Roman command. In 407, Alaric was instructed to retreat into Epirus where he lingered for a year. Stilicho was preoccupied with the usurpation attempt of Constantine III, so Alaric moved his forces into Noricum and demanded payment for his services instead. In 408, Stilicho himself succumbed to a court intrigue, accused of sedition by his enemies among the chief officials. Stilicho's

execution caused thousands of his federates (barbarian auxiliaries) to defect from Italy into Alaric's camp. When Honorius' government rebuffed his requests, Alaric marched into Italy and started the siege of Rome at the end of 408. His goal was to pressure Honorius into negotiations, but he was constantly thwarted as Honorius refused to concede. Abandoning any hope of further promotion by the Romans, Alaric allowed his army to sack Rome. It is only after this event that the Visigoths as a people came into being, with Alaric as their first king. He died shortly afterward, while taking his forces to southern Italy. Alaric's fame in Western culture rested on his sack of Rome, which reverberated around the Roman world.

Alesia, Siege of (52 BCE)

The siege of Alesia was one of the most significant operations of the late Republic—a massive blockade-and-battle rather than a conventional siege. Caesar's victory broke the back of the Gallic revolt of 52 BCE, ushering in five centuries of Roman rule in Gaul and freeing him to confront Pompey in the final struggle for dominance—but it was a near-run thing.

Caesar responded to the massive Gallic revolt with customary boldness, marching on important Gallic towns and forcing Vercingetorix, the leader of the Gallic coalition, to fight and risk defeat rather than continue to gather his strength. But when Caesar marched his army toward the large hill fort of Alesia (near Dijon in east-central France) he was running out of time,

and he must have been placing his hopes on a quick victory by assault—otherwise, his besieging army would have been pinned against Alesia and smashed by the Gallic relief army (this was certainly Vercingetorix’s plan). But, as Caesar tells us in the *Gallic Wars*, he saw upon arrival that Alesia “seemed impossible to capture, unless by blockade.” Although the hill fort was indeed a place of great natural strength, it was still approachable from the west. The real problem was that Vercingetorix’s army was too large to simply assault, and Caesar did not have the time to both contain it and approach it with siege works that would diminish the advantages of the Gallic position.

Alesia, which has been very extensively excavated, is the great showpiece of Rome’s highly labor-intensive approach to siege warfare. Caesar’s men built a fortification system—a trench, then obstacle fields, a double ditch, and finally an earthen rampart topped with a wooden palisade and towers every 80 feet—11 miles in circumference, cutting Alesia off from outside aid. To meet the expected relief force Caesar then constructed a similar fortification system facing outward, this one 14 miles in circumference (all of this took about a month, and Caesar seems to have exaggerated the comprehensiveness of the works, but most of what he claims was built has been identified by archaeologists).

Caesar’s vastly inferior numbers led him to depart from his usual practice of headlong offensive warfare, cleverly returning Vercingetorix’s challenge by adopting a sort of passive-aggressive posture: he dug himself into a trap and dared the Gauls to attack. His smaller army might be attacked from two sides, but now they had two important tactical advantages: short interior lines (they could rush back and forth within the ring of fortifications) and the fortifications themselves, which allowed the few Roman troops on any length of wall to do great damage with arrow-shooting artillery, bows, slings, and volleys of heavy throwing spears while the Gauls struggled to approach the walls. And Caesar had taken care to store provisions: if the Gauls did not attack, Vercingetorix’s army would starve before his—so attack they did.

For better or for worse, our only real source for the fighting at Alesia is Caesar himself, and he provides a gripping description of several days of fighting: skirmishes outside the ring, a night attack on his walls, and finally an all-out assault from both armies on many points of the wall. With his men unable to effectively defend every area under attack, Caesar found a

vantage point and dispatched reserve cohorts to hard-pressed areas, leading the last reserves himself. When the Gauls within were thrown back from the walls, Caesar also personally led the general breakout against the besieging army—he had a knack for appearing at the decisive point of his victories, at least when he is telling the story. Nevertheless, the sudden Roman breakout routed the Gauls, Vercingetorix surrendered, and the campaign was over.

Alexander Severus (Emperor) (222–235 CE)

Born Marcus Iulius Gessius Bassianus Alexianus in Syria ca. 208 CE, Alexander Severus was Roman emperor from 222 to 235 CE. His mother Iulia Mamaea was the niece of Iulia Domna, wife of the emperor Septimius Severus (193–211 CE). The young Alexianus lived at Emesa in Syria until his cousin Elagabalus became emperor in 218 CE. In 221 CE, Elagabalus adopted Alexianus as his heir. Less than a year later, Elagabalus was murdered by the soldiers and Alexianus ascended to the throne as Marcus Aurelius Severus Alexander.

The *Historia Augusta* portrays Alexander as the ideal prince, but there were many serious problems at court. The praetorian prefect Ulpian was murdered in a power struggle in 223 CE. Alexander's mother Mamaea was almost universally unpopular, earning a reputation for greed and cruelty. In 225 CE, Alexander married a woman from a senatorial family, Sallustia Barbia Orbiana, but she was exiled by Mamaea less than two years later.

Orbiana's father was accused of treason and put to death.

The last years of Alexander's reign were dominated by warfare. In 230 CE, the Sassanid Persians attacked Roman settlements along the eastern frontier, forcing the emperor to take to the field in the following year. The campaign lasted until 233 CE, and successfully stemmed the Persian advance, but not without casualties on both sides. In 234 CE, Alexander embarked on an expedition against the Alamanni, who had crossed the Rhine frontier in Germany. However, the army staged a mutiny in March 235 CE and murdered Alexander and Mamaea at Mainz.

The depiction of Alexander in Herodian, who wrote a history of Rome from Marcus Aurelius to 238 CE, is more accurate and much less flattering than the unreliable depiction in the *Historia Augusta's* Life of Alexander, which depicts Alexander Severus as an ideal emperor.

Allia River, Battle of the (390/87 BCE)

The battle of the River Allia, a tributary of the Tiber approximately 18 kilometers north of Rome, took place in either July of 390 or 387 BCE. It was a decisive victory for Gaul and an embarrassing defeat for Rome that paved the way for the sacking of the city of Rome. The conflict arose when the Senones, a Gallic tribe, attempted to settle on Etruscan land, namely Clusium (mod. Siena). The Etruscans, feeling vulnerable, appealed to Rome for help. The Romans had recently exercised military control in the area and responded by dispatching a delegation, which included members of the influential Fabii family, for talks. However, diplomatic efforts failed, and the Clusians sent an army to force the Senones off their land. In the commotion that ensued, Quintus Fabius slew a Gallic chieftain, which enraged (the)

Brennus, chieftain of the Senones and leader of the Gauls. He deemed the Roman action a breach of neutrality. The Gauls sent their own commission to Rome to demand justice, but instead the Romans rewarded the Fabii with military commands. This offense enraged the Gauls who pledged war on Rome.

Ancient and modern versions of the encounter vary significantly, particularly concerning the confusion surrounding troop numbers for both sides and in the after effects of the battle, but the sequence of events is as follows. The Gauls marched from Clusium to Rome where they were met by a Roman contingent, led by Quintus Sulpicius, at the Allia. The Roman armies at this time were part-time forces who were called upon in times of crises, and their amateur status is clearly visible in the ensuing battle. The Romans adopted a phalanx formation of fighting with poorly equipped conscripts out on the flanks. This enabled the Gauls to attack the outer edges of the phalanx to work their way to the center to cut down the richer better-armed Roman soldiers. In the panic that ensued, surviving Roman soldiers fled to take refuge in Veii (mod. Veio) and Rome. In the aftermath of Allia, Rome was left defenseless, and it endured a seven-month siege that nearly destroyed it. The Gauls were later bribed with gold to leave the City.

The defeat at Allia ranks among Rome's worst military confrontations. Indeed, the Gallic victory forced Rome to take stock of the situation, and it quickly brought in measures to prevent such a thing from happening again. These included the building of a more robust stone wall, known as the Servian Wall, to defend the city from external attacks, which would not happen again in fact until the fifth century CE. The Romans also needed to appease their Italian neighbors who felt shaky after the defeat. Indeed, once confidence was reestablished, the Gauls would be driven out into France as opposed to settling on the Italian peninsula. Finally, the Romans had to improve their military systems, particularly armaments and tactics. They learned how ineffective the phalanx was but how effective Gallic weaponry had been in their defeat, particularly the sword and the shield, and made changes to suit. It would become the starting point of future successful Roman armies.

Alliances

Alliances (Latin *societates*, sg. *societas*) typically refer to partnerships between Rome and other states whose rules and mutual obligations are set down in a formal document, such as a treaty (Latin *foedus*, pl. *foedera*). Rome struck treaties with other states for the purposes of establishing zones of influence and activity (e.g., Rome's first treaty with Carthage, dated to 509 BCE: Polybius 3.22–23), pledging mutual assistance in the event of war (e.g., Rome's third treaty with Carthage, against Pyrrhus, king of Epirus, who invaded Italy and Sicily in the 270s: Polybius 3.25.1–5), coordinating military activity in the face of a common enemy (e.g., Rome's treaty with the Aetolian League in 211: Livy 26.24.8–14; *SEG* 13.382), or establishing a peace “for all time” after wars (e.g., the Peace of Apamea between Rome and the Seleucid king Antiochus III: Polybius 21.42). All treaty forms seem to have implied a promise of permanent mutual friendship between the treaty partners (even when not explicitly stated in the opening formula, typically, “there shall be [peace and] friendship between...”).

Alliances were often guaranteed through an exchange of hostages and/or oaths before the gods, although violations of alliance terms often took place, resulting in enmity and outright warfare. Polybius describes the Roman procedure for taking an oath, originally sworn by Jupiter Lapis, but then by Mars and Quirinus, as follows: “the man swearing the treaty takes a stone in his hand, swears in the name of the state by saying, ‘If I abide by this my oath may all good be mine, but if I do otherwise in thought or act, let all other men dwell safe in their own countries under their own laws and in possession of their own substance, temples, and tombs, and may I alone

be cast forth, even as this stone,' and so saying he throws the stone from his hand" (Polybius 25.6–7). Rome's partners typically swore by their own gods. In earlier periods, the Roman priestly *fetiales* signed the treaties, but later oversaw their religious aspects, while Roman commanders in the field signed them. All treaties, however, only took effect after being ratified by the Roman people in the centuriate assembly in Rome.

The sources use three main formulas for referring to Roman international partners—*socius*, *amicus*, and *socius et amicus*. It was once believed that the latter formula was a distinct technical-legal category referring to those who had a "treaty of friendship" (as opposed to a treaty of alliance) with Rome, but there is no evidence whatsoever for a distinct treaty of friendship. Strictly speaking *socius* refers to a state that has a formal treaty with Rome, *amicus* to a nontreated relationship without formal mutual obligations or rules, and *socius et amicus* (usually) to an *amicus* without a treaty, but the literary (and even epigraphic) sources are not so careful in making these distinctions.

It also used to be thought that *foedera aequa* ("equal treaties") and *foedera iniqua* ("unequal treaties") referred to two distinct types of Roman treaty. The *foedera iniqua*, therefore, came to be associated with treaties that included a "*maiestas* clause," that is, a statement that pledged Rome's treaty partner "to preserve readily and without fraud the majesty of the Roman people" (*maiestatem populi Romani comiter et sine dolo malo conservare*, as in the Roman treaty of peace with the Aetolian League in 189 BCE: Livy 38.11; cf. Polybius 21.32; and the treaty of alliance with Spanish Gades in 78: Cicero, *Pro Balbo* 35). It is now generally acknowledged, however, that *foedera aequa* and *iniqua* are rhetorical descriptions by Roman historians and do not refer to a technical-legal difference between two types of treaty.

In contrast to the rarely used "*maiestas* clause," most Roman treaties contained clauses mandating that the partner states "were to have the same friends and enemies," and would provide mutual assistance, "if they were able" (an "escape clause" of sorts).

One of the earliest treaties Rome struck within Italy itself was the Cassian Treaty, traditionally dated to 493 BCE, between the Romans and the other Latins. Its provisions indicate that it was an equal mutual defense pact (Dionysius *History of Rome* 6.95). The Hernici were later included in the *foedus Cassianum*. After the dissolution of the Latin League in 338, the treaty's terms covered only Roman-founded Latin colonies.

Rome established alliances with other states in Italy, collectively referred to as *socii*, *socii Italici*, or *foederati*, sometimes using formal treaties to enshrine mutual rights and obligations. There are only 14 securely documented Italian *foedera* before 265 BCE. The many hundreds of other Italian communities with which Rome entered relations before 265 were probably bound to Rome only by virtue of having performed *deditio*, unconditional surrender, and thus were brought under Roman *dicio* (jurisdiction). Regardless of how they were regulated, however, all these relations were unequal, favoring Roman priorities over those of the Italian *socii*. The inequality was most prominently manifested in the unilateral obligation of the allies to provide troops to fight in Rome's wars under Roman commanders.

When the Romans began expanding overseas in the third and second centuries BCE, especially in the eastern Mediterranean, they adapted their own alliance-making practices to the Greeks', but were less inclined than the Greeks to tie themselves down by formal treaties, instead preferring the loose, bilateral bond of international *amicitia*. Excluding limited treaties of peace (such as the Peace of Phoenice ending the First Macedonian War in 205 BCE) and temporary wartime pacts (such as the Roman-Aetolian treaty of 211), the Romans struck only eight *foedera* in the eastern Mediterranean before 146, with the Aetolian League (189 BCE), Antiochus III of Syria (188), the Achaean League (before 183), Rhodes (164 or 163), Cibyra in Phrygia (after 167), Alabanda in Caria (unknown date), Heraclea Pontica (unknown date), and Maronea in Thrace (sometime after 167, but quite possibly after 146). Others followed 146, but not many are attested (e.g., Callatis, Methymna [after 129], Epidaurus [ca. 112], Astypalaea [105], Thyrrheum [94], the Lycian League [46], Cnidus [45], and Mytilene [25]). Outside of Greece, Rome apparently struck even fewer formal treaties, such as with the Jews in 161, Spanish Gades in 78, and Sicilian Messana, Tauromenium, and perhaps Netum, at unknown dates.

Allies (Status)

Allied status (Latin *societas*, thus *socius*, "ally" [pl. *socii*]) sometimes refers to those states that entered formal partnerships with Rome (usually via a treaty), in contrast with those who enjoyed informal relations of *amicitia*, or "friendship."

Within Italy, *socii* refers to states that were obligated to provide military contingents to Roman armies, sometimes mandated by treaty, but more often by virtue of having performed *deditio*, unconditional surrender, to Rome and thus brought under Roman *dicio* (jurisdiction). In exchange for surrendering this control over their foreign policy, the Italian *socii* had a claim on Roman protection, (usually) tax-exempt status, and a share in the spoils of Rome's victories (both movable property and captured territory).

Italian allied status contrasted with Latin status, a set of rights and obligations the Romans at first extended only to their own ethno-linguistic group, the Latins. Latin status came to be seen as more privileged than the looser allied status as Roman power grew since it resembled a half-way house to full Roman citizenship, whereas allied status usually involved no such mechanism and was reserved for those Italian peoples who were more distant from the Romans in terms of geography, ethnicity, language, customs, and laws (e.g., the Etruscans, the Greeks of southern Italy). Typically, allies enjoyed full control over their domestic affairs, but this changed as Roman power grew, and Roman magistrates increasingly interfered in the internal politics of allied states. The *formula togatorum* ("the list of togate peoples"), kept at Rome, specified the number of troops each ally contributed to the Roman army. The only extra-Italian ally listed in the *formula* was Sicilian Messana.

Eventually, the Italian allies, who shouldered immense military burdens in Roman wars, came to resent Roman interference in their internal affairs, their lack of judicial and social rights, and their vulnerability to the arbitrary exercise of *imperium* by Roman magistrates. This led to the so-called Social War (or the War of the Allies) in 91–87 BCE, when a significant number of central and southern Italian states revolted against Roman rule. The war and its rationale were ended by 87 when the Romans granted full Roman citizenship to allied states south of the Po River in northern Italy.

Amicitia

“Friendship,” derived from the Latin *amare*, “to love” (so, too, *amicus*,

“friend”). Alongside *clientela* (the patron-client relationship, patronage), *amicitia* was one of the most important social relationships in Roman society. It was an informal bond, unfettered by institutional or legal rules, but cemented through personal *fides* (“loyalty,” “good faith”). *Amicitia* usually describes partnerships between status equals or near-equals, although formal equality in all aspects of the relationship was, in practice, difficult to achieve. Like many other states throughout human history, Rome naturally extended the language, behaviors, and psychology of friendship to the international sphere, identifying its functional (informal) allies as “friends” (*amici*) and the relationship as “friendship” (*amicitia*).

In Roman political life, *amicitia* between Roman aristocrats had a significant impact on the formation of political alliances and the distribution of political influence, particularly in the support and assistance aristocratic *amici* provided each other in trials, campaigning for election, and in an advisory capacity. Although similar in some respects to modern, western modes of friendship (which also involve reciprocal trust and affection, and the mutual performance of services), Roman *amicitia* (particularly between aristocrats) appears to have been a more instrumental relationship, openly based on the mutual performance of tangible duties, favors, and services. In contrast, *amicitia* could (and often did) describe intense, highly emotional, and physically close relationships. Friendship breakdown and dissolution could be equally intense and emotional, frequently leading to violent and destructive enmities and feuds.

Friendships are usually understood to describe relationships between status equals (or near-equals), but Roman *amicitia* seems to have been more tolerant and open about status differences between partners. This does not mean that unequal (or asymmetrical) friendships were euphemistic of some other type of informal relationship between unequals, such as *clientela*. The latter typically lacked the mutual affection, equality of self-determination, and level of intimacy characteristic of *amicitia*. The status gap separating patrons from clients was much greater than that separating inferior and superior friends. Exactly how much inequality had to occur before the friendship sank into a patron-client relationship varied by case, but the tipping point was probably reached when the inferiority of one partner could no longer be attenuated or compensated for by the performance of more and greater counter-favors and services.

In the international sphere, interstate *amicitia*, in contrast to

relationships governed by formal treaties of alliance (*foedus*, pl. *foedera*), describes loose, bilateral relationships governed by no formal legal rules. Such *amicitiae* amounted to mutual understandings that the two states were in a state of amicable relations, and that they were obligated (through the bond of *fides*) to assist each other during times of crisis if they were in a position to do so. The latter “escape clause” (which also appeared in some formal treaties) is indicative of the looseness of and flexibility afforded by international *amicitia*. This was clearly the intention behind the use of *amicitia* as a tool of diplomacy, since the Romans preferred not to restrict their own freedom of action in the international sphere by formally obligating themselves to help friendly states whenever called upon to do so. The response-flexibility of international *amicitia*, enjoyed by both sides, was desirable because of constraints on resources, the slowness of long-distance communication and travel in antiquity, and the number of competing claims on a state’s *fides* by the many states with which it had established relations.

During the middle Republic, the period of Rome’s rapid acquisition of an overseas empire, the Romans established scores of international *amicitiae* but very few formal treaties of alliance. The latter were typically used only as a last resort, after the bond of *amicitia* proved too loose to secure the consistent loyalty of Rome’s international partners (e.g., the Aetolian League in 189 BCE), or at the insistence of Rome’s partners (the republic of Rhodes in 163 BCE). The Romans often turned down requests for formal treaties of alliance (e.g., Antiochus III in 193). International *amicitia* was established in various ways: through wartime cooperation or mutual diplomatic agreement in the face of a common enemy, and through formal surrender to Rome (*deditio*) after defeat by Rome or to secure Roman protection against aggressors.

The first recorded Roman international *amicitiae* were established during the period of Rome’s conquest of Italy (fourth century BCE), but the earliest securely attested overseas *amicitiae* occurred during the second year of the First Punic War (263 BCE), when perhaps as many as 67 Sicilian towns and cities, in addition to Syracuse under the rule of King Hiero II, sought Roman protection and became Roman international *amici*. The First Illyrian War (229 BCE) against the Illyrian Ardiaei along the eastern coast of the Adriatic Sea resulted in Rome establishing friendships with actual and potential victims of Ardiaean aggression, including Corcyra, Apollonia,

Epidamnus, the Parthini and Atintani tribesmen, and the island state of Issa. Other cases include Ptolemaic Egypt, which became a Roman *amicus* in 273 BCE, Rhodes (likely) in 306, the Aetolian League in 211, King Attalus of Pergamum (probably) in winter 209/208, Athens (perhaps) in 208 or 209, the Seleucid king Antiochus III in 200, Masinissa of Numidia in 206, and the Achaean League in 198.

The Romans continued to use the language of *amicitia* to describe and construct their interstate relationships until well into the principate (e.g., Mytilene in 25 BCE), although the ever-increasing disparity of power between Rome and its friends may have made it increasingly anachronistic (and euphemistic) to do so.

[Ammianus \(ca. 330–395 CE\)](#)

Ammianus Marcellinus, a Roman Syrian born possibly at Antioch, was a Roman officer and the last significant Latin historian of the Roman Empire. Little is known about his life. What we do know comes primarily from autobiographical references in his *Res Gestae*. Ammianus came from a military family and spent much of his life serving in the Roman army. In his later years he composed a 31-book history of the Roman Empire from the reign of Nerva to the death of Valens (96–378). Ammianus intended his history to be a continuation of Tacitus’ history. The first 13 books quickly covered the years 96–353 and were lost by the sixth century. The remaining

18 books span a 25-year period, contain greater detail, and were drawn in many places from Ammianus' own experiences. Ammianus' work was most heavily influenced by Cicero and Sallust. Yet Ammianus also appreciated the works of Herodotus, Thucydides, Polybius, Homer, Virgil, Eunapius, Juvenal, and Valerius Maximus. He was a traditional Roman polytheist, and although he criticized Christians for their moral shortcomings, he did not support Julian's intolerance of Christianity.

Ammianus seemingly was born into a local aristocratic family in Syria, and his father likely was a successful career soldier. Ammianus followed his father into the officer corps of the Roman army. This indicates that he was of decent social standing and that he came from a military family. Ammianus was in opposition to Julian's policy of limiting the privileges of the *curiales*. Therefore, he might have been of a curial background as well.

Ammianus joined the Roman army around 350. Additionally, he was enrolled into the elite *protectores domestici* (household guards), demonstrating his privileged background. Soon after joining the army, Ammianus was assigned to the personal staff of general Ursicinus by Constantius II, where he served in several campaigns in both the east and west. Ammianus and his unit were called to Italy by Constantius in 355 to accompany him to Gaul to fight against the usurper Claudius Silvanus. After the assassination of Silvanus, Ursicinus was given temporary command of the Gallic armies. However, Ursicinus and his staff soon returned to the east because of the rising Sassanid Persian threat. In 359, Ammianus found himself trapped in the Sassanid siege of Amida. He was able to escape the fall of the city, but Constantius removed Ursicinus from command. Ammianus took a hiatus from the army until Julian's arrival in the east in 362. His last military campaign was Julian's ill-fated invasion of the Persian empire in 363. Ammianus spent much of the next 20 years traveling through the eastern half of the empire. By the mid-380s he had reached Rome and had begun writing his history. The work was likely finished soon after 391.

His extant work begins with an account of his service under Ursicinus. This portion of his history is the most influenced by Ammianus' personal experiences and the most biased. Ammianus sometimes provides considerable detail of events and commentary in an account that appears much like a personal memoir. The major section of his work is the life and career of Julian. Although Ammianus served in Julian's army, his accounts

of Julian's campaigns rely a good deal on other written sources and eyewitness accounts. Ammianus was an adamant supporter of Julian. Although Ammianus disagreed with and disapproved of some of Julian's religious decisions, such as his emphasis on divination and sacrifice or his banning of Christian intellectuals from teaching, he deeply admired Julian as a military leader and courageous soldier, depicting Julian as the ideal emperor as commander. Ammianus lamented Julian's early death and viewed it as a negative turning point in the history of Rome. Ammianus' accounts of Jovian, Valentinian I, and Valens are less detailed, and the setbacks of the Roman Empire after Julian's death are his focus. The finale of his work is the disastrous Roman defeat at the hands of the Goths at Adrianople in 378 and the death of Valens.

Ammianus' writing style is formal and elaborate, and his portrayal of events and development of characters is vivid. He utilized traditional rhetorical speeches, and satire noticeably influenced his work. His experiences as a soldier were fundamental to his judgments and writing approach. His ethnographical digressions, most notably his digression on the culture of the Huns and Alans, are a valuable addition to his history.

Ammianus' history generally is well received by modern historians. Edward Gibbon, whose high estimate of Ammianus was carried on by scholars such as A. H. M. Jones and M. L. W. Laistner, considered Ammianus a reliable and mostly impartial historian. John Matthews follows in this opinion. He argues that Ammianus fairly and accurately depicted the society in which he lived and that Ammianus provides an accurate picture of the second half of the fourth century CE. Timothy Barnes, although cautious about the impartiality of Ammianus, states that his history is fundamental to our understanding and interpretation of the fourth century. The value of Ammianus' work to the study of Late Antiquity for this period is unmatched.

The manuscript transmission of Ammianus' work is poor and unfortunate. Of the remaining eighteen books, corruptions and lacunae are found in numerous places. The text is transmitted solely by two Carolingian manuscripts of the ninth century: *M*, known as the *Fragmenta Marburgensia*, of which only six leaves survive; and *V*, the Vatican lat. 1873, from Fulda. Fourteen manuscripts of the fifteenth century are based off of *V*, and *V* was copied from *M*. Finally, the 1533 printed edition of Gelenius utilized *M* before it was dismembered, making Gelenius' edition an

important witness to the textual tradition of Ammianus' *Res Gestae*.

Anthemius (Emperor). See Fall of Roman Empire

Antoninus Pius (Emperor) (138–161 CE)

Antoninus Pius, Roman emperor in 138–161 CE, was born Titus Aurelius Fulvus Boionius Arrius Antoninus at Lanuvium in Italy in 86 CE. Antoninus was of distinguished senatorial family (both his father and grandfather had been consul), and he married Annia Galeria Faustina, a distant relative of the emperor Trajan. He embarked on a senatorial career, serving as consul in 120 CE and proconsul of Asia in 135/136 CE, but did not take on any posts with military responsibilities.

The emperor Hadrian had no children, and initially adopted Lucius Aelius Caesar as his heir. After Aelius' untimely death in 138 CE, Hadrian selected Antoninus in his place; Antoninus in turn adopted Aelius' son, Lucius Verus, and his nephew Marcus Aurelius, securing the imperial succession for subsequent generations. Antoninus' first act was to ensure Hadrian's deification by the Senate; this was no easy feat given his predecessor's turbulent relationship with the senators. In recognition of his loyalty toward Hadrian, Antoninus was granted the name of Pius

(“dutiful”).

Antoninus’ reign witnessed a small campaign in Scotland, after which the 60-kilometer long Antonine Wall was constructed between the firths of Forth and Clyde, extending Roman territory beyond the limits established by Hadrian. The emperor sought to secure the empire’s borders by a war in Mauretania and by appointing new kings of the Quadi (a barbarian tribe across the Danube), and the eastern kingdom of Armenia. Antoninus himself never left Italy, and earned a reputation as a fair and considerate ruler. He died peacefully in 161 CE and was afterward deified by the Senate.

Antonius Primus (Active 69 CE)

Conspirator and legate of the legion *VII Galbiana* in Pannonia on the Danube, Marcus Antonius Primus was a key adherent of Vespasian during the civil war known as the War of Four Emperors in 69 CE. The civil war began with the revolt of Vindex and Galba in 68. Between June 68 and December 69, the empire witnessed the rise and fall of the emperors Galba, Otho, and Vitellius, until the accession of Vespasian in July 69 and the death of Vitellius in December.

Little is known of Antonius Primus’ early career except that he was born in Tolosa, Gaul, and that in 61 he was ejected from the Senate by Nero on the grounds that he had conspired to forge a will. Following the death of Nero in June 68, Primus attached himself to the new emperor, Galba, and he was rewarded with the restoration of his senatorial rank as well as the command of the legion *VII Galbiana*. When Otho conspired to seize imperial power in January 69, Primus declared in favor of the new emperor. Vitellius, however, initiated a secondary civil war, supported by the legions of the lower Rhine. Primus offered his assistance to Otho; however, the

Pannonian legions were left out of the conflict.

Antonius Primus' decisive role in the events of the year 69 did not come until the latter half of the year. In August 69, motivated by the poor treatment of the Danubian and Pannonian legions by the newly instated emperor Vitellius, Primus declared his support for a new challenger to the throne—Vespasian. Primus gained the further support of the legions of Dalmatia and Illyricum for the Flavian cause. In September, despite warnings from Vespasian not to venture beyond Aquileia, Primus advanced into Italy ahead of the Flavian vanguard. Primus' bold move was rewarded by a decisive victory against the Vitellian forces at Cremona (also termed the Second Battle of Bedriacum) on October 24–25, which sparked the defections of Spain and Britain from the Vitellian cause and led Primus and his men all the way to Rome itself. For a short period after his victory, Primus functioned as the ruler of the capital. Nevertheless, his personal success was short-lived and Licinius Mucianus, upon his arrival in January of the following year, deprived Primus of his influence.

In the *Histories*, Tacitus devotes a great deal of space to his description of the exploits and character of Antonius Primus. Tacitus hails Primus for his eloquence, his bravery in action, and his skill in stirring up discord among his enemies; he however scorns Primus for his extravagance and greed during peacetime. The historian is particularly critical of the Flavian sack of Cremona, for which he blames Primus. Although Primus was directly responsible for the Flavian victory over the Vitellians, Tacitus emphasizes that Primus' rash invasion of Italy was contrary to Vespasian's wishes. The poet Martial was also a vigorous admirer of Primus, devoting four epigrams to the general.

Antonius Saturninus, Lucius (d. 89 CE)

Lucius Antonius Saturninus was a governor of Upper Germany who, perhaps inspired by the rise of Vitellius, rebelled against the emperor Domitian at Mogontiacum (Mainz) in early 89. He secured the support of several German tribes, who were unexpectedly prevented from joining him due to the thaw of the Rhine River. The governor of Lower Germany, Lappius Maximus, met Antonius Saturninus in battle and defeated him.

After the death of Antonius Saturninus, Domitian purged his allies and punished the two rebellious legions, relocating one to Pannonia. Domitian allegedly became more paranoid about senatorial conspiracies after the revolt and set a limit on the *deposita ad signa*, the savings bank that each legion kept with the standards, to deter future usurpers from claiming it.

Appian (ca. 90/95–160/65 CE)

Appianos of Alexandria, better known as Appian, was a Greek historian born in the Greek enclave of Alexandria, Egypt, around 90–95 CE. Little is known of his early life but what survives can be found in a few lines of the concluding part to the Preface of his *Roman History* and the letters of his friend the orator, Marcus Cornelius Fronto. He was in Alexandria at the time of the Jewish insurgencies in ca. 115–117 CE and worked there in an official capacity. He arrived in Rome sometime during Hadrian's reign, became a Roman citizen and worked as a legal expert in the reign of Antoninus Pius who awarded him an honorary procuratorship through the intercession of Fronto. He died ca. 160–165 CE.

Appian wrote an autobiography, which is now lost, and a history of

Rome, written in Greek, in 24 books of which nine survive complete and seven are in fragments. Appian's range of history is vast, and his approach to writing it was predominantly to give accounts of the different peoples conquered by the Romans. His intended audience was the Greek upper classes whom he wanted to inform about the greatness of Rome's empire. He focused particularly on Italians, Iberians, Carthaginians, Celts, Sicilians, Macedonians, Greeks, and so forth. These books were written in the order that the Romans subjugated each nation, and it would be safe to assume that the dominance of Appian's method of ordering by nation is seen especially in his important treatment of Rome's civil wars in the second half of his history, where they form part of the narrative of Rome's conquest of Egypt, which was of course a major concern to Appian as a native of Alexandria. Added to the mix of history were books entitled Hannibal and the Mithridatic Wars.

Appian's ability to write history was dependent not only on his source material, but also on how he used it to compose his monumental history. The debate about this evidence continues to be the subject of much discussion among modern historians, but Appian wrote in the second century CE and would, therefore, have had a range of sources available to him as well as materials that are now otherwise lost. Frustratingly, he provided no bibliography but he knew Latin well and Greek and Latin authors accessible to him would have included the likes of Polybius, Plutarch of Chaeronea, Sallust, Livy, Rutilius Rufus, Gaius Asinius Pollio, Hieronymus of Cardia, Claudius Quadrigarius, Dionysius of Halicarnassus, Caesar, and other authors. With this variety of writers at his disposal, it is often cynically argued that Appian simply transmitted the most pertinent parts of their works to which he added mistakes, thus making his history unreliable. However, recent scholarship has turned this view around arguing that he was a conscious contributor whose work was orderly and written in a lucid dramatic style. Although prone to some bias, being a keen enthusiast of the Romans, he was generally impartial and attacked the Romans and praised the conquered when necessary. Appian often got muddled. His knowledge of geography was sometimes poor: for example, in his *Iberikê* (*Spanish Wars*) his placing of Saguntum (mod. Sagunto) north of the River Ebro and his description of that river emptying into the northern sea are significant blunders. Geography, however, was not the key concern of many ancient writers. In terms of dates, chronology was not uppermost in his

mind even though he made a promise in the Preface to his *Roman History* to only date important events when he thought it necessary. Although careless, he occasionally adopts the Olympiad system of dating noting, for example, that the Hannibalic war occurred in the 140th Olympiad and Sulla's arrival in Brundisium (mod. Brindisi, Italy) was in the 174th Olympiad but declining to fix a date more precisely.

Perhaps his most important surviving work is the Roman *Civil Wars* in five books (from the Gracchi to Actium). It is the only available substantial narrative of an extraordinary period in Roman history that survives and is thus of vital importance to today's historians. Despite some confusion about the late Republic, he does exhibit some appreciation of the social, economic, and political issues of the day thus preserving this information in a way that his contemporaries did not. However, Appian's *Civil Wars* do require attention when interpreting the sequence of events as they have a propensity to concentrate purely on violence to the exclusion of the crisis of the late Republic, thus distorting the narrative. Nevertheless, it would be wrong to dismiss this work due to its frustrating nature.

Until recently, Appian has been given a bad press by modern historians. This is perhaps because of the expectations required when writing history, in his case, an inability to analyze the sources available to him. Appian simply gathered the evidence, jotted the important information down and added errors of his, and for this reason he has been deemed inaccurate. However, most ancient historians, such as Tacitus, Cassius Dio, and so on, often made errors in their works. Recent sober reassessments have recognized Appian as a narrator of facts who used his sources critically. This is particularly notable in his important compilation of the Roman civil wars, for the faults of the account cannot detract from its position as the one continuous narrative of the history of the late Roman Republic.

Appuleius Saturninus, Lucius (d. 100 BCE)

Lucius Appuleius Saturninus was twice a tribune of the plebs and leader of the *populares*, as a spiritual heir of the Gracchi and an opponent of the old aristocracy exemplified by the Caecilii Metelli and later Sulla. Appuleius Saturninus was killed in civil upheaval in Rome in 100 BCE.

Appuleius Saturninus rose in politics as a *popularis*, supporting policies that benefited the lower social strata at Rome and that opposed the wishes of the oligarchy. He was elected tribune for 101 BCE. He supported Marius and legislation to give land to Marius' veterans. Although Marius had ended the military crisis (the invasion of the Cimbri and Teutones) that required he hold four more consecutive consulships (104, 103, 102, and 101) after his consulship against Jugurtha, Marius chose to run for office again for the year 100. Appuleius Saturninus supported Marius' sixth bid for consul and himself ran for tribune a second time. Both of them won.

As tribune for the second time, Appuleius Saturninus proposed a bill to give land to Marius' veterans in north Italy and Africa, inspired by bills from the Gracchan era. In addition, he required that all senators must swear to uphold these laws within five days of their passage or be expelled from the Senate. Marius added a hedging clause that persuaded most senators to swear, but Quintus Caecilius Metellus Numidicus, formerly the patron but now an enemy of Marius, refused to swear and was forced into exile. This victory induced Appuleius Saturninus and his closest allies to abuse their power, alienating Marius.

Appuleius Saturninus decided to run for a third consecutive tribunate in 100 and was elected, even though it was not customary for tribunes of the plebs to hold multiple consecutive tribunates. When his allies killed the leading optimate candidate for the consulship, leaders in the Senate approached Marius with an offer of cooperation and future inclusion if he would break with Appuleius Saturninus. They then passed a *senatus consultum ultimum* to declare a state of emergency, and troops put many followers of Appuleius Saturninus to death. Although Appuleius Saturninus had sought refuge in the Capitol, he was induced to surrender with the

agreement that he would be spared execution. He and his surviving followers were imprisoned in the Senate House, where their opponents killed them by stoning them from the roof. As with his forerunners the Gracchi, Saturninus was thus murdered without a trial.

Aquae Sextiae and Vercellae, Battles of (102 and 101 BCE)

In the battles of Aquae Sextiae and Vercellae, Gaius Marius defeated the Germanic Cimbri and Teutones. Since 109 BCE, the Romans had suffered a series of military setbacks at the hands of wandering Germanic tribes, notably the devastating defeat in 105 at Arausio (near modern Orange) by the Cimbri and Teutones. Rome was alarmed, and feared an invasion of Italy so it broke with tradition and re-elected Marius, who had been victorious in the recent Jugurthine War, as consul for a second time. The dreaded offensive did not occur immediately. This gave Marius time to reorganize the Roman army into an efficient well-organized force. By 102, the tribes took the decision to invade Italy, but this time Rome was ready. Marius was re-elected again in 102 and 101 and given a commission to end the threat.

The Teutones, with the Ambrones, marched on Italy via the Mediterranean coast while the Cimbri and Tigurini, sought to cross the Alps from the northwest and northeast, respectively. This division proved fatal for the tribes. Marius' tactics were fundamental to the success of his heavily outnumbered Roman troops. His first mission was to engage the Teutones and Ambrones on his terms, and so he moved quickly to counter their advance by establishing a fortified base to control the Rhône valley. He

remained there thwarting the tribes by refusing to fight on their terms. This delay allowed Marius to choose the arena of battle: he selected Aquae Sextiae (mod. Aix-en-Provence), a wide flat and wooded river plain suited to the Romans. Marius occupied the high ground and dispatched a unit of 3,000 soldiers, under Claudius Marcellus, to hide in the wooded area so as to ambush the tribes on his instructions. They would be trapped with the river behind them. The impatient Ambrones tried to attack Marius on higher ground but were slaughtered losing around 30,000 men. When the Teutones attempted the next phase of the assault, Marius was able to employ Marcellus, destroying the remaining tribes. Inflated figures suggest 100,000 Germans were killed. The first phase of Marius' assignment was complete. He returned to Rome for a triumph, but postponed it because the Cimbri were pressing into Italy.

Marius' colleague for 102, Quintus Catulus, failed to hold off the advancing Cimbri. He left Rome to join Catulus whose command was extended to 101. Their joint forces, numbering around 53,000, were again heavily outnumbered forcing Marius to engineer the terms of engagement. He chose the plain at Vercellae (near Vercelli in northeast Italy). Once more, superior strategy and discipline enabled the Romans to block their enemy in a confined space, thus restricting use of their weaponry. Again, exaggerated numbers suggest between 120,000 and 140,000 tribesmen were slaughtered with 60,000 imprisoned. The consuls shared the honors, but Marius took the credit and was rewarded a sixth consulship in 100.

These two victories stemmed almost a decade of Germanic threats that had been troubling northern Italy and catapulted Marius to his greatest fame. Politically, the consequences were disastrous. Marius and his legate, Lucius Cornelius Sulla, would become rivals precipitating the first of several Civil Wars. And Marius ignored the Senate when granting Roman citizenship to his Italian allies. Future generals would again defy the Senate.

Aquilonia, Battle of (293 BCE)

The battle of Aquilonia was the last significant battle in the Third Samnite War (Livy 10.38–43), following upon the greater battle of Sentinum (295). The Roman forces were led by Lucius Papirius Cursor (the son of the Lucius Papirius Cursor sub vid.) and Spurius Carvilius Maximus. They defeated the Samnite “Linen Legion” of warriors bound by an allegedly cannibalistic oath. The Samnites retreated to Bovianum; the Romans sacked the town of Aquilonia. The subsequent course of the Samnite War is obscured by the abrupt end of the surviving text of Livy, which resumes in the Punic Wars era. However, the Samnites never recovered from the battles of Sentinum and Aquilonia.

Ara Pacis

A Roman monumental altar called the *Ara Pacis Augustae* (Altar of Augustan Peace), which commemorated the end of the late Republic’s civil wars and the prosperity of the Roman Empire under the first emperor, Augustus (27 BCE–14 CE). This altar embodied Augustus’ promise that he

would bring peace and stability to Rome after decades of war. The Roman Senate voted for the altar on July 4, 13 BCE and dedicated it on January 30, 9 BCE. The altar faced the Via Flaminia, along which Augustus returned from pacifying the western provinces. To the west, steps led into the Campus Martius in line with Augustus' monumental sundial. The pieces of the altar, found between 1568 and 1938, were reconstructed in a museum along the Tiber River, 450 meters from the altar's original location.

The altar, made of white Luna marble, rests on a podium (11.65 × 10.635 meters) and is surrounded by an enclosing wall with two doorways (3.60 meters wide). The reliefs within the enclosure depict a sacrifice motif. Outside of the enclosure, 1.55-meter tall carvings portray a procession including Augustus, his family, priests, and senators in togas. Next to the doorways, the reliefs represent King Numa (or Aeneas) and goddesses which may be Roma and Peace. These goddesses are symbols of Augustus' message of peace and prosperity, as well as the promise of a stable government based on ancient customs.

Arabia

Roman Arabia, roughly contiguous with modern Saudi Arabia, was divided into Arabia Deserta, the arid areas of the north Saudi Arabian peninsula, and Arabia Felix, the southern end of the peninsula, termed "Felix" for its prosperity as a producer of incense and spices and as an entrepôt for the Red Sea trade with India. The Romans did not incorporate Arabia, which originally lay beyond the empire's eastern frontier, as a province before the reign of Trajan (98–117). The kingdom of the Nabataeans, a pre-Islamic Arab people, was used as a buffer and Roman client. Trajan's eastern conquests allowed the annexation of the Nabataean kingdom and the

creation of a Roman province termed Arabia. Its main cities were Bostra, garrisoned by a legion, and Petra, the ancient capital of the Nabataeans. Controlling the overland routes to Arabia Felix became less necessary due to the development of the Red Sea ocean route to India.

Sara E. Phang

View of the Ara Pacis Augustae (Altar of Augustan Peace). Erected by the emperor Augustus (27 BCE–14 CE), the Ara Pacis was dedicated in 9 BCE. The Ara Pacis glorifies the reign of Augustus as bringing a triumphant end to civil war. Located in Rome, Italy. (Gabriele Croppi/Grand Tour/Corbis)

Arbitration

Also known as “third-party, binding arbitration,” this was a formal, legal process whereby two (or two groups of) quarreling states submitted their disputes to a third, usually neutral state for a decision, which would then be binding on the parties to the dispute. Conceptually related to arbitration is mediation, an informal, cooperative process whereby a neutral or allied state offered to broker talks between hostile or warring states to resolve a dispute peacefully. In mediations, the disputants did not bind themselves to agree to the outcome.

Examples of binding arbitration occur in mythology, and the practice became a fixture of interstate relations in Classical Greece. After Macedonian hegemony over Greece was established, individual city-states continued to arbitrate between other city-states (e.g., Cos in a boundary dispute between Klazomenai and Teos, ca. 302 BCE: *SEG* XXVIII.697), but under Philip II, Alexander the Great, and the Hellenistic successor kings, the Greeks increasingly turned to powerful kings for arbitration (as when Lysimachus decided in favor of Samos in a border dispute with Priene: *OGIS* 13 = Welles, *RC*, no. 7). The Greeks also used nonbinding, informal mediations to resolve disputes.

The Romans, in contrast to the Greeks, seemed to have been very reluctant to submit their disputes with others to binding, third-party arbitration and often displayed an aversion to nonbinding mediations as well. The offer of Rhodes to mediate Rome’s dispute with Perseus, king of Macedon, in 168 BCE is perhaps the most famous example of this, but is also exceptional in terms of the hostility with which the Romans treated the Rhodian offer (even though the mediation had been suggested by a Roman commander in the first place). The problem was not the offer itself, but the timing: the Rhodians made their offer in the Roman Senate immediately after news of Perseus’ decisive defeat at Pydna had been announced in Rome, which made the Rhodian offer appear in retrospect to benefit Perseus more than Rome.

Despite the fact that according to the Roman principle of *iustum bellum*, “the just war,” whereby the gods had already judged that Rome was in the right in undertaking wars, the Romans seem not to have been averse *in principle* to offers by other states to mediate these wars once they were underway. “Mediation,” in this context, however, approximated the modern

diplomatic practices of “good offices” or “conciliation.” In modern diplomacy, mediation usually involves a third party who actively participates in discussions and regards (and treats) the disputants as equals, while “good offices” or “conciliation” refers to the actions of a third party who encourages disputants to come together and talk, but does not actually take part in discussions or prod them into settling their dispute. Ancient “mediation” often consisted merely of “(apologetic) deprecation,” when a third party begged one of the disputants to lay aside his anger and make peace for the sake of all concerned (including the mediator, whose livelihood may suffer from the effects of war). Because they regarded themselves as always being in the right (and believed that the gods had already decided the matter in their favor), the Romans were constitutionally averse to being regarded by mediators as their opponents’ equals, and they were less likely to agree to compromise solutions, as usually happens in modern mediations.

Besides the Rhodian case, there are many examples of the Romans trying to upset mediations that they perceived were contrary to their own best interests. In 207 BCE, for example, Ptolemy IV tried to mediate a “comprehensive peace” between the Roman-Aetolian alliance on the one hand, and Philip V of Macedon and his allies on the other, but the Roman commander, Publius Sulpicius Galba, sabotaged the talks by declaring that he was not authorized to commit Rome to a peace settlement (Appian, *Macedonian Wars* 3). By contrast, there are several good examples of the Romans willingly engaging in a mediation process (mediation being understood, as always, as the equivalent of modern “good offices,” “conciliation,” or “[apologetic] deprecation”). In 212 BCE, the Roman commander Marcus Claudius Marcellus accepted an offer by various Sicilian *amici* of Rome to mediate between Syracuse and Rome. In addition to the Ptolemaic mediation of 207, mentioned earlier, there were many more attempts to mediate an end to the First Macedonian War between 209 and 207 when Rome participated in (or at least tolerated) mediation attempts between the Rome-Aetolia alliance and Philip V. In 205, the Epirotes brokered the peace talks between Macedon and Rome, which resulted in the Peace of Phoenice, ending Rome’s first war against Philip V. The Epirotes also successfully brought the Romans and Philip V to the table at the Aous conference of 198.

The Achaeans and Aetolians intervened in 195 between the Romans and

Boeotians. Heraclea Pontica intervened in 190 between Rome and Antiochus III, which resulted in the Romans delaying their campaign against the king by several months, and Roman *amicitia* with the mediator. Between 190 and 189, both Athens and Rhodes tried to “deprecate the anger” of the Romans against the Aetolians. In 188, Rome’s mythical kinsmen, the Trojan Ilians, attempted to “deprecate the anger” of the Romans against Lycia.

[Arbogast \(d. ca. 394 CE\)](#)

Frankish supreme commander of the western Roman army (ca. 389–394),

Arbogast is first attested, together with his compatriot and possible relative Bauto, as *magister militum* of the western emperor Gratian (375–383). Both generals were sent to Macedonia in 380 to assist the eastern emperor Theodosius I against the Goths. Bauto was Valentinian II's dominant *magister militum* after the murder of Gratian by Magnus Maximus in 383. When Bauto died, somewhere after 385, Valentinian II's army nominated Arbogast as their supreme commander. During Magnus Maximus' invasion of Italy, Valentinian and his court fled to Thessalonica where they requested aid from Theodosius. Arbogast was one of the senior commanders who assisted the eastern Roman campaign to crush Maximus.

After defeating Maximus in 388, Arbogast was instructed to eliminate further resistance in Gaul, including Maximus' young son Victor at Trier. While Theodosius took on the government of Italy and the rest of the empire, Valentinian II was sent to Gaul where Arbogast was instructed to supervise the young emperor. Arbogast's barbarian background did not affect his loyalty to the empire: in 390, he launched a punitive campaign over the Rhine to pacify those Frankish tribes who had used Maximus' civil war in Italy as an opportunity to pillage the Rhineland. Arbogast's campaign was the last Roman military operation on the German side of the Rhine frontier, before its collapse in 407.

Meanwhile, Arbogast confined Valentinian to Vienne under virtual house arrest, while taking over governmental affairs in Gaul and appointing key officials. After Theodosius' departure to Constantinople in 391, tension between the young emperor and his generalissimo came to a climax. Arbogast allegedly killed one of Valentinian's counselors in the latter's presence, while the emperor tried to cashier him afterward. Arbogast simply ignored his dismissal, pointing out that he did not owe his appointment to Valentinian—a reference to either the army or Theodosius being Arbogast's real patrons. In May 392, Valentinian II was found dead, apparently by hanging, in the palace. Most likely, Valentinian had committed suicide, though later eastern sources accused Arbogast of having murdered him.

After waiting months for instructions from Theodosius, Arbogast saw no other alternative than elevating an emperor of his own choice, Eugenius, a professor of rhetoric. Both Arbogast and Eugenius tried appeasing Theodosius, who instead proclaimed his son Honorius as western emperor and declared war in 394. Later historians accused the pagan Arbogast of preparing aggressive anti-Christian policies. However, Eugenius was a

Christian and the conflict between Arbogast, and Theodosius was inherently secular. Officials of diverse religions worked in both governments. Arbogast successfully led the western Roman army during the first day of battle at the Frigidus, but Theodosius ultimately prevailed on the second. Afterward, Arbogast fled into the mountains nearby, wandering around for days until he threw himself upon his sword. Arbogast's career highlights the evolution of power relations in the western Roman Empire, where the emperor's authority became increasingly marginalized and dominant generals took over government.

Arcadius (Emperor) (395–408 CE)

Arcadius (eastern Roman emperor 395–408), the son of Theodosius I, was born in 377/378. He was proclaimed co-Augustus in 383 and served as regent of the eastern empire while his father was campaigning in Italy. After the death of his father in 395, he and Honorius became joint rulers of the empire. Arcadius was married to Aelia Eudoxia, the daughter of Flavius Bauto, a Romanized Frank and one of Theodosius' generals.

Arcadius was a notoriously weak ruler, falling under the influence of several successive regents. The first was Rufinus, the praetorian prefect, who was assassinated in 395. He was killed by Gothic troops; this may have been at the behest of Stilicho. Then the eunuch Eutropius rose to power, having gained the favor of Arcadius. Eutropius was deposed by the Gothic general and *magister militum* Gainas, who used a revolt by the Ostrogoth Tribigild in Phrygia to discredit Eutropius. Gainas colluded with Tribigild, deliberately allowing the revolt to grow. Tribigild demanded the resignation

of Eutropius as a condition of peace. Eutropius had lost the favor of the empress Eudoxia and he rather unwisely nominated himself for consul in the year 399. These factors, combined with senatorial resentment of Eutropius, were enough to lead to Eutropius' dismissal and banishment.

In 399, Gainas joined his Gothic troops with the rebels and marched on Constantinople. Arcadius surrendered and Gainas ruled the capital for six months. Gainas was not particularly adept at ruling Constantinople; he was also an Arian and a Goth, which led to friction with the orthodox Roman population of Constantinople. While Gainas was away from the city, a popular revolt broke out. He began to withdraw his troops, but a fifth of them were trapped and slaughtered. He attempted to attack Constantinople again in 400, but was defeated by his successor the Gothic *magister militum* Fravitta. Gainas fled across the Danube and was killed by the Huns. The Praetorian Prefect Anthemius entered into this power vacuum, influencing Arcadius until the emperor died in 408.

Following what occurred with Gainas, there seems to have been a brief period of antibarbarian popular feeling, which manifested itself in an aversion to barbarian generals. Fravitta, though he had defeated Gainas, was deposed and executed soon after. Drastic conscription of Roman citizens was undertaken to create a more Roman army. This policy lasted into the early years of the reign of Theodosius II.

Arcadius seems to have been more tolerant of paganism than most other later Roman emperors. He refused to order the destruction of the pagan temple in Gaza, despite pressure from the Church and his wife. Arcadius spent most of his life in Constantinople and the presence of the imperial court in Constantinople led to a rise in prominence for the local bishop. John Chrysostom, the famous Antiochene orator, was appointed bishop of Constantinople in 397, lending an increased dignity to the office. John proved impolitic for the job, feuding with the Alexandrian bishop and the Empress Eudoxia and he was exiled in 405.

Arch of Constantine

The Arch of Constantine is a marble triple triumphal arch erected in 315 CE to celebrate the *decennalia* (10th anniversary) of Constantine the Great (306–337). Around 21 meters tall and 26 meters wide, the arch stands in the monumental heart of Rome, next to the Colosseum and near the entrances to the Palatine and the Via Sacra, leading into the Forum.

The arch's plan echoes that of the Arch of Septimius Severus, and the decorative scheme involves elaborate use of *spolia*, pieces of older monuments reused alongside new sculpture. These are taken from monuments erected by Trajan (98–117), Hadrian (117–138), and Marcus Aurelius (161–180), three well-loved emperors; the emperors' heads have been recarved as portraits of Constantine, and in two cases as (probably) his father Constantius I.

A series of long friezes around the Arch narrates Constantine's 312 Italian campaign against Maxentius. The style of the frieze is late antique, with squat figures and unusual proportions intended to convey symbolic or ideological messages, rather than the more realistic classical style seen in the *spolia*. The narrative begins on the western side with Constantine's departure from Milan, continues along the south face with the siege at Verona and battle of the Milvian Bridge, an entry into Rome on the east face, and finally scenes of public address and largesse on the north, facing the Via Appia. Such triumphalist celebration of civil war is startling. The long inscription, repeated on the long north and south faces, hails Constantine as "liberator of the City" and "founder of peace," as do two short inscriptions inside the main arch, paired with Trajanic battle scenes.

Eight columns, topped with freestanding sculptures of Dacians, originally from a monument to Trajan, flank the archways. The bases of the

columns depict figures of Victory and captive prisoners. The *spolia* are set above the main frieze on two levels: rectangular panels from the period of Trajan or Marcus Aurelius, above circular Hadrianic panels. Charging Trajanic cavalry appear on the west and east faces, while the north and south show mid-second century CE scenes of imperial virtues. These connect with the events shown on the narrative frieze. Along the south side, martial actions are celebrated: presenting a barbarian king, granting *clementia* to prisoners, addressing the troops, and the ritual purification of the army. On the north, civil virtues appear: ceremonial arrival and departure, liberality, and the dispensing of justice. The eight circular panels show alternating scenes of hunting (south: riding and a bear; north: boar and lion) and sacrifices (to Silvanus, Diana, Apollo, and Hercules). On the west and east faces, newly made round panels show Luna descending into the sea, and Sol rising in his chariot.

The Arch of Constantine is a complex piece of propaganda. The clear message concerns Constantine as victorious liberator of Rome from the “tyrant” Maxentius, while the use of *spolia* deliberately connects Constantine to the great emperors of the past and their virtues, both civilian and military, suggesting a return to a golden age. The celebration of a victory in civil war is unusual, but at this date Constantine had no major victories over barbarians to depict, as would be more usual in triumphal art. No Christian imagery appears, though the inscription refers with studied ambiguity only to the “inspiration of the divinity” (*instinctu divinitatis*). It also declares the monument was dedicated by the Senate and People to the emperor. The propaganda is most likely Constantine’s own devising, but may contain a message from the Senate about admirable models.

Arch of Septimius Severus (Rome)

The Arch of Septimius Severus was dedicated in 203 CE at the northwest end of the Roman forum to mark the tenth anniversary of the emperor’s ascension to the throne and to commemorate his and his sons’ two victories over the Persians. Severus chose this location for his arch because he had dreamt that the former emperor, Pertinax, here fell from his horse, after which Severus mounted the animal. The arch is much larger than the Arch of Titus, standing 75 feet high and 80 feet wide. It has several vaulted interior chambers, a staircase, and three archways. Originally a large statue of Severus and his two sons in a six-horsed chariot graced the roof of the arch. Like the Arch of Titus it was built of Pentelic marble, but unlike Titus’ arch it was built upon a platform and was not meant to function with a road running through it. Covered on both sides with reliefs of the Persian wars, the use of art on the arch to display warfare differs from the styles used on the columns of Trajan and Marcus Aurelius and moves further away from classicism. The Arch of Severus is a unique, masterfully crafted structure that denotes the authority of Rome over its enemies and the influence of Severus’ new dynasty.

Originally the bronze inscription on the arch praised the accomplishments of Severus and his sons, Caracalla and Geta. However, when Severus died in 211 CE, his eldest son Caracalla had Geta murdered and inflicted *damnatio memoriae* upon him, destroying all inscriptions and images of Geta. The fourth line of the inscription on the arch concerning Geta was replaced.

Situated in a central position to the five forums of Rome and directly below the Capitoline Hill, the Arch of Severus is a commanding structure that overshadows the Arch of Titus with its craftsmanship and grandeur. Although Severus’ arch lacks the religious impact enjoyed by that of Titus, it does however commemorate the virtual destruction of Rome’s most powerful enemy and displays Rome’s most successful eastern campaign.

Severus conducted two successful wars against Persia (195 and 197-198 CE). The second of which ended in the reconquest of much of the lands that had been lost since the invasion of Trajan 80 some years before. Severus' forces sacked the Persian capitol of Ctesiphon and reestablished Rome's Mesopotamian provinces. His invasions proved highly successful and helped lead to the fall of the Arsacid Persian Empire. The reliefs on the arch illustrate in a continuous narrative Severus' campaigns against the Persians. Additionally, there are well-preserved reliefs on the bases of the arch of Roman soldiers and Persian prisoners. Severus' arch is distinctive in its art and architecture and is a structure of great importance for its reliable display of the Roman military and the events of Severus' Persian wars.

Arch of Titus

The Arch of Titus is an honorific arch that was built to memorialize Titus' military victory in the Jewish War of 66–70 CE by his brother, the emperor Domitian, in 82 CE. The arch is situated to the southeast of the Roman Forum, on the Via Sacra, near the Colosseum. There was also another arch built in 71 CE in the Circus Maximus, which honored Titus' victory; the surviving Arch of Titus has proved both more memorable and durable. The Arch of Titus served as an icon of Flavian power. The Flavians came to power in the War of Four Emperors in 69 CE, during which Vespasian was

Scene from the Arch of Titus. The Jewish War (66–70 CE) ended with the fall of Jerusalem, plundered by the Romans. Shown in this scene, the menorah and other treasures of the Jewish Temple were carried in the triumphal procession of Vespasian and Titus. Arch of Titus, Rome, Italy. (Luke Jones)

Armenia

Ancient Armenia was located east of Cappadocia, north of Syria and Mesopotamia, and west of Media Atropatene, part of the Persian Empire. In the Hellenistic period, Armenia was claimed by the Seleucids, who established two satrapies, Greater and Lesser Armenia. Following the Seleucid king Antiochus III's defeat by the Romans at the Battle of Magnesia (190 BCE), the satrapies revolted and established independent

kingdoms. The Romans dealt with these kings as client monarchs.

The most notable king of Armenia, Tigranes II (ca. 95–56 BCE), allied with Mithridates VI of Pontus in the latter's revolt against Roman hegemony. Sulla's war against Mithridates broke their alliance, but Tigranes began a campaign of expansion, claiming Syria, Phoenicia, and Cilicia in 83 BCE and the title "King of Kings." Lucius Licinius Lucullus waged a successful war against Tigranes, capturing his capital Tigranocerta. After Pompey's final victory over Mithridates VI, Tigranes surrendered to Pompey and was restricted to Armenia and to the role of Roman client.

In the Principate, the early emperors continued to employ Armenian client monarchs as a buffer against the Arsacid Persian Empire. In the reign of Nero, Roman policy toward Armenia became more aggressive. Gnaeus Domitius Corbulo captured Armenia and installed Tigranes V as king of Armenia. After the Persians invaded and ejected Tigranes, Corbulo (initially recalled) was reinstated and negotiated a settlement with Persia in which a Persian candidate, Tiridates, was installed as king of Armenia. Tiridates traveled to Rome to be formally crowned by Nero.

Armenia continued to be a pawn in the Roman-Persian conflict. Trajan (98–117) invaded Armenia and used it as a bridgehead to a major campaign against the Persians. In the mid-third century, the accession of the more aggressive Sassanid dynasty intensified the conflict.

Arminius (d. 21 CE)

Arminius was a German tribal chief who led indigenous resistance to the Roman conquest of Germany, first by masterminding the ambush of three Roman legions at Teutoburger Wald in 9 CE and subsequently resisting Roman efforts to reconquer the lost province in 15–16 CE.

Arminius was the son of Sigimer, chieftain of the Cherusci. Arminius

and his brother Flavus enlisted in the Roman army as noncitizen auxiliaries and received both promotions and citizenship as a reward for their services. In 6 CE, Tiberius recommended Publius Quinctilius Varus for the command of the *provincia* of Germania. Arminius joined Varus' staff and served under him in 7–9 CE, but plotted against him in 9 CE, leading to the battle of Teutoburger Wald (the Varian disaster). Arminius died in 21 CE.

In this period, the traditional military assignments (*provinciae*) were becoming regularized as provinces, which Roman proconsuls and legates were expected to govern. As governor, Varus introduced urban, Roman institutions, such as a forum-style market, law courts, roads, and taxation. According to the Roman historian Tacitus, Arminius began to fear that Roman culture would erode and overwhelm the Germanic identity. He plotted to drive out the Romans, rallying his countrymen against Roman taxes.

Another prominent chief, Segestes, detected Arminius' conspiracy and informed Varus, but Varus refused to believe Segestes, so complete was his trust in Arminius. In September 9 CE, Varus marched his three legions from Vetera (Xanten) toward his winter headquarters, Moguntiacum (Mainz), when word reached him that a rebellion had arisen deep in the interior of Germany. The uprising occurred according to Arminius' plan. Arminius offered to raise additional forces for Varus and was dispatched. Instead, he raised forces to attack Varus, once the Romans were deep in the forests of Westphalia at Teutoburger Wald. The death blow was struck at the site of modern Kalkriese. Seeing no escape, Varus and many others committed suicide. Of those who surrendered, Arminius sacrificed some to native gods in a gesture of piety and/or psychological warfare, the rest were enslaved.

Arminius and his followers, distracted by the opportunity to plunder the Romans, failed to follow up their victory. By the time Arminius reached the Rhine, Varus' nephew, Lucius Nonius Asprenas, had destroyed the bridges, thus preventing a German invasion of Gaul and Italy. As it was, Arminius freed the Germans from Roman rule.

For the next few years, Arminius stood among the foremost German leaders. Meanwhile, Tiberius secured the Rhine frontier, only infrequently crossing the Rhine on short raids. Tiberius regarded the province as lost. Tiberius' general and nephew, Germanicus made every effort to reconquer Germany. Tacitus, *Annals* 2.9–10 records a conference between Arminius and Flavus on the banks of the Weser in which the brothers called each

other a traitor and nearly came to blows over their diverse allegiances. Although Germanicus defeated Arminius at the battle of Idistaviso in 16 CE, he was unable to break the Germans. Germanicus took Arminius' pregnant wife captive and brought her to Rome; their son was born in captivity.

Having survived the Roman challenge, Arminius also fought and defeated King Maroboduus of Bohemia, but he did not live long to enjoy it. The very decentralization of power he rebelled to maintain also kept him from becoming king of all the Germans. He was slain by a conspiracy from among his own family. Tacitus, *Annals* 2.88 rightly proclaims him the liberator of Germany. In future, Arminius and Flavus were not the only auxiliary veterans to lead native revolts.

Early modern and modern German nationalists have regarded Arminius as a proto-nationalist leader and hero, building on the ancient accounts.

Arms and Armor

Arms and armor, the personal weapons and protective equipment of Roman

soldiers, included the cuirass (*lorica*) or body armor, helmet, shield, sword (*gladius* or *spatha*), sword belt, javelin (*pilum*) or spear, and optional greaves. The expense of metal armor, which had to be made by hand, constrained military recruitment before the late Republic. In the late Republic and Principate, the supply of armor became partly public. Types of Roman armor were closely related to changes in tactics. However, partly private supply and recycling meant that the armor worn by any particular military division or unit was not standardized, in contrast with modern concepts of military supply and uniform. Hence one-to-one inferences from armor about tactics are difficult to conclude.

In the early Republic, heavy-armed infantry were equipped like Greek hoplites and recruited from a propertied stratum, according to the Servian constitution, that could afford such armor. The manipular army of the middle Republic (third and early second centuries BCE) is described by Polybius (6.21.7–23.16). Manipular legionaries were equipped with a large curved shield or *scutum* (wood with iron reinforcements), *lorica* (cuirass), *galea* (helmet), *gladius* (short sword), and *pila* (sg. *pilum*, javelin). In this period, the *lorica* was made from ring mail (*lorica hamata*). The *hastati*, *principes*, and *triarii* were outfitted similarly and were all recruited from the *assidui* or small farmers who met a minimum property requirement. These families probably handed down arms and armor among the male descendants who were liable for service. In contrast, the *velites* or light-armed troops were recruited from a poorer social stratum and were less well equipped. According to Polybius, *velites* bore a round shield, a helmet or cap, and *pila*. Instead of full body armor they wore a chest protector, a metal plate worn above the heart. However, this chest protector seems to have been popular among early Italian warriors and not necessarily correlated with low status. Notably, the Romans acknowledged that their equipment was inspired by many other cultures: the typical helmet of the late Republic and early empire was Celtic; the *gladius* was originally Spanish.

When the cohort system of legionary organization and tactics was introduced, beginning in the early second century BCE, and consolidated by Marius, the *velites* were eliminated; all infantry fighters constituted heavily armed troops. The change to cohort tactics did not require extensive changes in the arms and armor of heavy infantry. The relatively short *gladius* or Spanish sword was designed for thrusting, and the *scutum* covered most of the body, implying that legionaries in this period used close-order tactics.

The expense of arms and armor contributed to the crisis in recruitment in the late second century BCE. Poor recruits from landless families could not afford arms and armor. Gaius Gracchus proposed a law that the Roman state should equip its soldiers. In practice, the warlords of the late Republic, among them Pompey and Crassus, equipped their legions themselves. Crassus, allegedly the richest man in Rome in the mid-first century BCE, boasted that no man could call himself rich who could not equip an army at his own expense (Plutarch, *Crassus* 2.7). According to Suetonius, Julius Caesar provided his men with ornate armor chased with gold and silver, so that they would fight harder out of fear of losing them (Suetonius, *Iulius* 67).

As the latter anecdote shows, Roman armor was a form of military display as well as protection. Uniform as such (military clothing that displays unit identity and pride) did not exist; to some degree, armor played this role. In the late Republic and early empire, Roman officers (of tribune rank and above) were able to afford the most ornate armor, including the heroic “muscle” cuirass, a Hellenistic import often adorned with relief ornament. However, even plainly equipped soldiers were expected to keep their arms sharp and their armor bright and in good condition; as the military treatise writer Vegetius says, “the splendor of arms terrifies the enemy” (Vegetius, *Military Affairs* 2.14).

Arms and armor were closely associated with *virtus* (courage) and with military discipline. Losing or throwing away arms and armor were at all times severely punished. Marcus Porcius Cato, the son of Cato the Censor, lost hold of his sword in the battle of Pydna (168 BCE); he returned to the mêlée to retrieve his sword rather than face the disgrace of losing it (Plutarch, *Cato Maior* 20.7–8). Bearing the weight of armor and shield (depending on type, a cuirass could weigh between 10 and 20 kg) displayed a soldier’s physical fitness, endurance, and morale. Roman anecdotes of poor discipline routinely accuse personnel of not wearing their armor or letting it deteriorate (Tacitus, *Annals* 13.35; Fronto *To the Emperor Verus* 2.1.19; Vegetius 1.20). A mid-first century CE commander, Gnaeus Domitius Corbulo, executed soldiers for not wearing their armor or weapons in the field (Tacitus, *Annals* 11.18). In the early third-century CE sources on military law, a soldier who fails to wear or loses his sword or armor in the field earns severe punishment (Digest 49.16.3.13, 14.1).

However, in noncombat conditions soldiers often did not wear body

armor but were distinguished by the military belt (*cingulum*), supporting a sword and dagger. The belt originally helped to support the weight of the *lorica hamata*, but became so essential a feature of the soldier's costume that *discingere*, to remove the belt, meant "to quit/be expelled from the service." Soldiers' tombstones frequently depicted unarmored soldiers wearing the military belt. The other item of clothing closely associated with soldiers was *caligae*, boots with distinctive hobnails on the soles.

Roman armor underwent shifts in design. In the late first century BCE, the more famous *lorica segmentata*, the laminated or strip cuirass, was introduced, made from strips of iron that overlapped and curved to fit the body and that were articulated upon leather straps. It is most famous from Trajan's Column, commemorating the Dacian Wars in the early second century CE. However, ring mail and a third type of body armor, the *lorica squamata*, made from overlapping metal scales like fish scales, coexisted with the *lorica segmentata*. Scale armor became more popular in the third century CE and later. Cavalry armor included elaborate display armor, worn in formal riding exercises (the *hippika gymnasia* of Arrian's *Tactica*), including ornate metal masks that covered the entire face.

Bronze statuette of a Roman soldier. The *lorica segmentata* or metal strip cuirass, commonly used in the early Empire, is shown here in stylized form. Located in Greek and Roman Antiquities, British Museum, London, United Kingdom. (The Trustees of the British Museum/Art Resource, NY)

Shifts in types of arms and armor may have reflected changes in tactics, from an emphasis on infantry to one on cavalry. A shift in the type of sword occurred in the third century CE, from the shorter *gladius* to the longer *spatha* associated most with cavalry but also used by infantry. In this period as well, round shields became more prevalent, as more appropriate to cavalry than the infantry *scutum*. In the fourth century and later, an extreme form of cavalry armor, arising in competition with the Persians, extensively armored the horse as well as the rider; these riders were known as *cataphractarii*. The advantage of cataphracts was as shock troops; the weight of this armor soon exhausted both horse and rider.

There is debate over whether different branches of the service wore different types of armor, as one might expect in a modern army. It was long asserted, based on Trajan's Column, that legionaries wore the *lorica segmentata* and auxiliaries wore mail shirts. On the Column, the differing body armor is intended to differentiate the groups and thus make the scenes more legible. It may not reflect actual practice. Other art and archaeological finds show that legionaries also wore mail shirts, seen for instance on the *Tropaeum Traiani* at Adamklissi, and scale armor. To standardize armor for a division or unit may have been too expensive (see below). Branch and unit differentiation may have employed less costly details such as helmet badges and painted insignia on shields, details that were likely to be painted on stone monuments and thus do not survive in art.

Furthermore, within a unit, individual soldiers' armor probably did not present a uniform appearance. We have seen that legionaries might wear the *lorica segmentata*, ring mail shirts, or scale armor. Legions had armorers and *fabricae* (workshops), producing armor and equipment, but the constraints of ancient production probably made it prohibitively expensive to equip a unit with all-new, uniform armor, except at its formation. The Praetorian Guard and the *equites singulares*, elite divisions constantly on display in the city of Rome, may have presented a more uniform appearance (cf. Tacitus, *Histories* 1.38). In legionary and auxiliary units, some equipment was probably relatively old and others new; inscriptions on pieces of equipment suggest more than one owner. Armorers constantly repaired and recycled parts of equipment. Supply may also have been semi-privatized: some soldiers received equipment from the unit (deducted from their pay, as in Tacitus, *Annals* 1.17). Other personnel may have brought equipment from home or purchased it privately, adding their choice of

ornamentation (particularly to helmets, sword belts, and horse trappings) and employing regional styles. This lack of uniformity renders inferences about tactics difficult, except for the broad shift to cavalry weapons and armor discussed above.

The evidence for Roman arms and armor includes passages in Greek and Roman authors (such as those cited above); Roman triumphal art and funerary monuments; and archaeological finds. Overall relatively little triumphal art and archaeological evidence survive from the early, middle, and late Republic. The political instability of the late Republic did not favor the production of permanent victory monuments, and bronze and iron equipment was probably melted down and reused. Early imperial sources of evidence are much richer, including above all, the Column of Trajan and the Column of Marcus Aurelius at Rome; other victory monuments at Rome and in the provinces, including the *Tropaeum Traiani* near Adamklissi, Romania; coins, despite their small scale; and individual soldiers' tombstones. Artistic sources present challenges of interpretation and lost detail. Like other ancient sculpture, Trajan's Column and the Column of Marcus were originally painted in bright colors, bringing out details that now are lost. Plain-looking jerkins with zigzag edges, worn by the auxiliaries on Trajan's Column, were probably mail shirts and possibly painted gray or covered in gesso (plaster) that enabled carving of ring detail. On the Column of Marcus, auxiliaries' mail shirts are represented with a pattern of drilled holes.

Metal equipment tended to be recycled, so that survivals of equipment are fortuitous. After a battle, armor would be recovered and reused or recycled if too damaged to use. Burial with arms and armor was considered a barbarian custom, not Roman. However, archaeologists have found chance remains of body armor. Since the *lorica segmentata's* plates were soft iron, they have often rusted away *in situ* and what survive are the copper-alloy buckles and other fittings for the straps. Small amounts of ring mail and scale armor have also been found.

Besides professional archaeology and art history, another mode of researching Roman arms and armor is reconstruction and reenactment. Mail shirts are relatively easy to make, though time-consuming (50,000 to 100,000 rings, depending on ring size, must be linked together by hand). The reconstruction of the *lorica segmentata* has been more challenging; its representation on Trajan's Column and other victory art was probably

stylized and in any case does not show how the internal straps were configured. Reconstruction shows that soldiers probably wore some form of padding under their armor to cushion against blows and prevent chafing. Reenactment furthermore tends to produce better-quality, newer equipment, and brighter clothing (thanks to modern dyes) than the average nonelite unit was likely to display at any one time. However, reenactment and live-action wargaming have answered questions that ancient authors took for granted and continue to draw popular attention and interest in the subject.

Army in Politics

By the late Republic, the Roman army had become a group differentiated from the civilian citizen body and with distinct and competing material interests. The late Republic's generals and political leaders exploited these material interests, a pattern that continued in the empire. In the imperial

period, the Praetorian Guard played the largest role in politics because of its proximity to Rome and the emperors.

Nonetheless, in sociological terms, the army did not resemble a modern political party, modern social and economic class, or ancient order (a group defined by formal status rather than by wealth). It was staffed by a cross-section of Roman society, from senators down to common men and even slaves (soldiers' servants). Except for the martial values and some religious cults, Roman soldiers do not seem to have had aspirations that were very different from "civilian" society.

Soldiers' support of aristocratic leaders (commanders and emperors) was conditioned by their respect for hierarchy. Under normal conditions, they felt a bond of loyalty that was reinforced by oaths and by religious rites presided over by the commander (consul in the traditional Republic) or emperor as commander-in-chief or his deputies.

Commanders and the emperor as commander-in-chief reinforced this bond of loyalty by conferring honors and rewards on their men. The payments to soldiers (pay, donatives, and *praemia militiae*) were seen as honors and rewards. However, soldiers withdrew their support from leaders whom they perceived as dishonoring them, through arrogant or immoral behavior, mistreatment of soldiers, or the withholding of material rewards. This is the most plausible explanation for the defections and mutinies in the late Republic and for military revolts against emperors and acclamation of new emperors in the imperial period. The emperor Galba (68–69 CE) refused to give a promised donative to the praetorians, saying, "I levy my soldiers, I don't buy them" (Tacitus, *Histories* 1.5). The praetorians defected from Galba, supporting the coup of Marcus Salvius Otho (emperor 69 CE). The historian Tacitus blames their mercenary nature, but also indicates that they felt that Galba's refusal had dishonored them; a token payment would have sufficed (Tacitus, *Histories* 1.18).

In imperial politics, soldiers seem to have favored dynastic continuity, the probable reason for the praetorians' support of Claudius I (41–54 CE) as emperor, though he followed his accession with a large donative to the praetorians. Claudius was a member of the Julio-Claudian imperial family, though an unlikely choice as emperor (he was disabled and had held no public or military offices). The soldiers also supported Marcus Aurelius' choice of his son Commodus (180–192 CE) and Septimius Severus' choice of his son Caracalla (211–217). Sources favorable to Constantine the Great

(306–337) depict the army as supporting his hereditary claim, as the son of Constantius I, one of the Tetrarchs, even though the Tetrarchic system was markedly nonhereditary. For similar reasons the army supported Valentinian I's choice of his brother Valens and his young son Gratian as co-emperors and subsequently elevated Valentinian's even younger son Valentinian II.

It is less certain whether Roman soldiers were persuaded to support or defect from leaders for general political reasons, for example, to support a political position. The armies of the late Republic seem to have been loyal to personalities, not to political programs. Many soldiers in the late Republic, especially after the Social War (91–87 BCE) enfranchised Italians, were recruited from outside Rome and probably knew little about the civic traditions and institutions of Rome. This trend increased as soldiers were recruited abroad. Though Brutus and Cassius presented themselves as defending the traditional Republic, their soldiers were recruited from Roman citizens and allies in the eastern Mediterranean who probably knew little or nothing about republican traditions. In the Principate, soldiers were increasingly recruited from the provinces and frontier regions. But Roman leaders probably could sway their armies with basic xenophobia, as Octavian did in his civil war against Antony and Cleopatra, depicting Cleopatra as an alien "Egyptian" (her dynasty was Macedonian Greek in origin).

Soldiers may have cared about the moral conduct of their leaders and emperors, especially related to masculinity (*virtus*, courage or manliness, was one of the martial virtues). Nero's public singing and acting on the stage and homosexual experimentation (he is alleged to have entered a same-sex marriage) alienated military officers and soldiers, as did the effeminate homosexual conduct of the teenage emperor Elagabalus. However, soldiers were probably not hostile to a leader's homosexual conduct *per se* as long as the leader demonstrated his *virtus* (manliness) and his fitness to command, as was the case with the emperors Trajan and Hadrian.

The most extensive apparent sources for "propaganda" directed at soldiers are the prebattle speeches in ancient authors, usually given by the commander of each side before battle. These, however, are almost always the rhetorical creations of the ancient historians, not verbatim records of what was said. They reflect the historians' views of what was important

rather than what might have actually persuaded the armies. However in a few instances in civil wars, we know that pamphlets were distributed to soldiers, assuming their basic literacy or that comrades would read to illiterate soldiers. Documentary sources also attest the emperors' addresses (*adlocutiones*) to the troops.

Asia Minor

The region known to the Romans as Asia is termed today Asia Minor, approximating the modern nation of Turkey, bounded on the west by the Aegean Sea, to the south by the Mediterranean Sea, and to the north by the

Black Sea. Earlier, Asia Minor, including the Greek Ionian coast, was part of the Persian Empire. After Alexander the Great (336–323 BCE) conquered the Persian Empire and died prematurely, his empire was fought over by his generals, founders of the Hellenistic royal dynasties. Asia Minor was ruled by the Antigonid dynasty, then by the Seleucids until the Romans defeated the Seleucid king Antiochus III at the battle of Magnesia in 190 BCE.

The Romans allowed the Seleucids to retain only a small part of Asia Minor; its other kingdoms, notably Pergamum, became clients of Rome and eventually bequeathed their realms to Rome. Thus by the early first century BCE Rome controlled Asia Minor, financially exploiting it. The native king Mithridates VI of Pontus, a realm on the Black Sea, provoked a revolt in 88 BCE that allegedly killed 80,000 Romans and Italians, mostly traders and tax farmers. In revenge Sulla led a Roman army against Mithridates in 85/84, but it was Pompey who ultimately defeated Mithridates for good. The inhabitants of Asia Minor sided with Pompey in the civil war of Caesar and the Pompeians (49–45 BCE) and with Brutus, Cassius, and Antony in the triumviral wars that led to the triumph of Octavian as sole ruler of the Roman world.

To the Romans of the imperial period, “Asia” usually meant the largest Roman province in Asia Minor, rather than the entire western Asian continent. Other provinces in Asia Minor were Bithynia (added in 74 BCE and later merged with Pontus), Galatia, Cappadocia, Lycia and Pamphylia, and Cilicia. Asia Minor’s western (Ionian) coast boasted many wealthy, famous Greek cities, such as Ephesus, Sardis, Smyrna, Pergamum, Miletus, and Apamea. These cities retained local self-government. They sent representatives to the Council (koinon) of Asia, as did the various peoples of the mountainous, less developed interior. The Council was responsible for the provincial imperial cult; its chief priests, the Asiarchs, were highly prominent notables. However, the most powerful person in Asia Minor was the Roman proconsul of Asia, the governor. His seat was at Ephesus, but he traveled from city to city holding assizes. The proconsulship of Asia was one of the most prestigious public offices that an imperial Roman senator could hold.

Asia was a wealthy province and its cities had a high reputation for Greek culture, producing many Greek public intellectuals (rhetors and sophists). These elites considered the interior to be rustic. Christianity spread rapidly in Asia Minor, especially in the interior. In the third century

CE, Asia suffered from economic decline and from the raids of the Goths in the 250s and 260s. Asia Minor's provinces were subdivided and reorganized by Diocletian (284–305). In the fourth century, the imperial power shifted its interest to Constantinople (founded 324) and the route to the eastern frontier and the war with Persia, exacerbating the decline of the Greek cities, magnificent ruins of which still stand today.

In terms of civil-military relations, Asia Minor is one of the regions where conflict is attested in various surviving inscriptions. The conflicts arose because Asia Minor was the main route from the Danubian provinces to the eastern frontier. Troops frequently traveled through Asia Minor and requisitioned transport from civilians. Civilians could turn to still-strong civic institutions to petition the emperors to repress abusive requisitions.

Assassination

Assassinations in ancient Rome show a shift in motive from the republic, when assassinations and related violent deaths were politically motivated but did not result in coups, to the empire, when the assassination of emperors often played a role in usurpations or coups, transferring power to the next ruler. In the imperial period, the motive of coup is not always present; some early imperial assassinations had the motive of restoring the republic, and others were motivated by revenge. However, imperial assassinations as coups or usurpations dominate the historical record.

The earliest assassinations in Roman history date from the early Republic and thus are shadowy in detail, despite their dramatization and elaboration by Livy and Dionysius of Halicarnassus. The first king of Rome, Romulus, is said to have killed his brother Remus when the latter leaped

over the furrow he had ploughed to mark the walls of Rome (Livy 1.7). The story is given as a variant, and perhaps was elaborated when politically motivated violence became more common in the late Republic.

According to Livy 4.13, during a famine the Senate appointed the elderly Cincinnatus dictator for a second time in 432 BCE. A wealthy merchant named Spurius Maelius was believed to be distributing free grain to the people at his own expense to curry favor with the people and accelerate his rise as the champion of the people against the Senate in the Greek model of the demagogue or would-be *tyrannos*. To eliminate this threat, Cincinnatus ordered his *magister equitum* Servilius Ahala to assassinate Maelius. Servilius Ahala slew Maelius, and upon arrest he explained that he had followed the direct orders of the dictator, whose word was absolute. Ahala went down in legendary history as a tyrannicide, which was equal to a liberator in Roman psychology.

At the start of the first century BCE, the Italians clamored for full rights, which the Romans refused to grant. The one man who seemed capable of finding a solution was the tribune of the plebs Marcus Livius Drusus, but he was killed by an unknown assassin in 91 BCE. His assassination provoked the Italians to revolt against the Romans in the Social War (91–87 BCE), a *de facto* civil war on a far greater scale than the upheavals that accompanied the deaths of the Gracchi brothers. If Livius Drusus' assassin was an opponent of Italian rights, the result was the exact opposite of the assassin's goal and at the cost of tens of thousands of lives on both sides, for the Social War ended with the Romans granting full citizenship to those Italians who agreed to make peace.

A generation later, a real and an alleged assassination changed the course of history. A group of bankrupted aristocrats allegedly conspired to overthrow the government, led by Catiline (Lucius Sergius Catilina) and his ally, Gnaeus Calpurnius Piso (not the same Piso as the subject of the CAGR article, s.v.). Sensing the danger, the Senate sent Piso to govern Spain to separate him from Catiline and tempt him with the opportunity to plunder the province. However, Piso was so rapacious that the locals assassinated him, thereby weakening Catiline's faction by the loss of this influential figure. Cicero and less emphatically Sallust claim that Catiline, having failed to win election twice, tried to assassinate Cicero. When that failed, Catiline invited slaves to rebel and assembled an army to overthrow the state. It is uncertain whether Cicero's version is accurate, but a short civil war

followed (the Catilinarian War, 63–62 BCE) that ended with the destruction of Catiline's army and his death in battle.

Another provincial governor whose assassination changed history was Sextus Julius Caesar, cousin and protégé of Julius Caesar. Sextus was sent to govern Syria as part of his training, possibly to succeed to power. However, Sextus was assassinated by disgruntled ex-Pompeians in revenge for their defeat in the Caesarian-Pompeian civil war. His death forced Julius Caesar to turn to his three great-nephews as heirs, of whom he chose Gaius Octavius (Octavian, the future emperor Augustus) for adoption.

These assassinations are distinct from other forms of violent death in political conflicts, such as the deaths of the Gracchi brothers and of Lucius Appuleius Saturninus (Appian, *Civil Wars* 1.28–32). Tiberius Gracchus and his followers were beaten to death by angry senators in a riot (133 BCE). After the Senate's passage of the *senatus consultum ultimum* authorizing any necessary force, Gaius Gracchus and his followers were hunted down in a purge (121 BCE). As his capture was imminent, Gaius committed suicide by ordering his slave to kill him. Appuleius Saturninus and his followers, imprisoned in the Senate House by Marius, were killed by their enemies who climbed onto the roof and stoned them with the roof tiles (Appian, *Civil Wars* 1.32). No one person claimed these deaths as assassinations.

Of course, the most famous assassination in Roman history is that of Julius Caesar himself in 44 BCE. A conspiracy of 23–35 senators (as many as 60 in later sources) agreed to murder the dictator on the Ides of March (March 15) days before he was to depart Rome to invade the Persian Empire. The assassins had various motives, ranging from personal resentment (Cassius) to political freedom and restoring the republic (Brutus). In error, Brutus insisted that the assassins spare Mark Antony and assassinate only Caesar to send a message against tyranny. Brutus felt a keen duty to live up to his ancestors Ahala the tyrannicide and the original Lucius Junius Brutus, who had opposed King Tarquinius Superbus. Caesar's death eliminated the man, but not his followers; Mark Antony and Caesar's heir Octavian survived. Subsequently, the Second Triumvirate took revenge upon the assassins and killed most of them in the next two years (two survived until 30 BCE). The Republic never returned. Rome reverted to monarchy under good emperors and tyranny under the rest.

A large number of Roman emperors were murdered or otherwise died violently, distorting an attempt to estimate their longevity and natural

mortality (Scheidel 1999). Some of the early assassinations or alleged attempts were politically motivated attempts to restore the republic. Augustus himself survived numerous conspiracies and a few near assassination attempts to die at the old age of 76. Few emperors were so fortunate in their longevity. While campaigning in Germany in 10 CE, Tiberius also survived an assassination attempt (Suetonius, *Tiberius* 19), but no attempts are known during his principate. The assassination of Gaius (Caligula) is particularly significant because it is often regarded as the last gasp of the republic. The conspirators were largely motivated by personal hatred, but the Senate seized the opportunity to declare a restoration of the republic. Much to the discomfort of the Senate, the Praetorian Guard hailed Claudius emperor and forced the Senate to reverse course and acknowledge Claudius. As the nephew of Tiberius, brother of Germanicus, and uncle of Gaius, Claudius' dynastic claim was clear. There was never again a plausible attempt to restore the republic. Thereafter, whenever an emperor was assassinated, the goal was always replacement of the individual.

Most assassinations of emperors were coups or usurpations, seeking to replace one emperor with another. Victims of coups include Claudius (41–54), whose wife Agrippina and step-son Nero wanted him out of the way; Galba (69), supplanted by Otho; Domitian (81–96), supplanted by Nerva (96–98), and others. A palace conspiracy that probably included Marcus Cocceius Nerva, the main beneficiary of the plot, brought down Domitian. Very similarly a century later, Commodus was also assassinated in 192 by a palace conspiracy, to the benefit of Helvius Pertinax, the City Prefect and next emperor. It seems likely that the successor was at least aware of the plot, if not a participant.

The assassination of emperors often features revenge, the assassin being motivated by resentment or vengeance. This was the case in the assassination of Caligula by Cassius Chaerea, a praetorian officer whom Caligula had singled out for mockery. The individual praetorians who murdered Galba at Otho's instigation resented Galba's parsimony and his insult to them by failing to give a donative. Victims of assassinations motivated by revenge or resentment include Pertinax (193) by the praetorians, Alexander Severus (222–235) and Maximinus I Thrax (235–238) by their soldiers, and Aurelian (270–275) by his officers.

In some cases not enough is known to identify the type of murder. In the civil wars of the third century, the acclamation of an officer as emperor by

his army often meant that the incumbent would be assassinated, often by his own staff. Some other violent deaths of emperors were lynchings by the public, as with Vitellius, murdered by the Roman urban rabble (December 69), and Elagabalus (222). Lynchings or revenge killings often created confusion and inspired multiple claimants to the throne, seeking official recognition (especially in the case of the year 238, when Balbinus and Pupienus were also killed), unless an obvious successor could be found quickly or arrived on the scene to take control.

The long interlude between the assassinations of Domitian and Commodus owes to the peaceful transitions of power from Nerva (96–98) through Marcus Aurelius (161–180), but Rome would not again experience such stability or general peace. From the death of Commodus forwards, emperors succumbed to assassination (or murder) with increasing regularity, especially during the crisis of the third century (235–284), when almost every emperor was assassinated or murdered. Many of the third-century crisis emperors were usurpers who hoped to establish a dynasty, but instead were assassinated after only a short reign of under four years—frequently along with their family. Assassinations recurred as well in the fourth and fifth centuries, such as that of Constans by Magnentius (350), Gratian by Magnus Maximus (383), possibly Valentinian II by Arbogast (392), Valentinian III by Petronius Maximus (455), and a flurry of short-lived emperors thereafter. Notably, many of the assassinated fourth-century emperors were relatively young men who lost the support of their military officers.

Assassination and usurpation were responses to crisis, including frequent invasions, economic crisis, epidemics, and internal turmoil. Whereas the conspirators often saw an incapable emperor as the problem, it turned out that the instability created by frequent revolts and frequent assassinations were the problem that sent the empire into a downward spiral.

Associations

Voluntary associations, common in the Roman world, were also liable to government surveillance and repression as possible sources of civil unrest. The term *collegium* (plural *collegia*) sometimes also refers to the priestly colleges of *pontifices* and *augures*, which were limited to the aristocracy. In general, *collegia* were voluntary associations with a broad social range of membership. They might be professional or occupational, religious, or purely social.

Roman professional or occupational *collegia* are sometimes termed “guilds” but unlike medieval guilds or modern unions, they did not regulate the economic activities of a given profession or occupation. A typical *collegium* of tradespeople or craftsmen met, held formal meals, and voted for magistrates who presided over the *collegium*; the members donated money to a common fund for the food and drink and for funerary services for deceased members. Many Latin inscriptions attest these *collegia*, their members, and their by-laws. Religious *collegia* represented the worshippers of a particular god, and organized cult activities as well as meals and funerary services. Social *collegia* were usually local in nature, “neighborhood” organizations, in the city of Rome centered on the *vici* or “wards.” Religious and social *collegia* might overlap, as in the cult *collegia* termed *Compitales*, venerating the *Lares Compitales* or deities of street

corners in the city of Rome; these were also local neighborhood organizations.

Collegia came under suspicion either because they represented new cults that were suspect (see “Cults, Pagan”) or because political leaders exploited them to raise supporters. Clodius and other *popularis* leaders recruited supporters for mob-like activities from the *collegia* of the city of Rome (e.g., Cicero, *Pro Sestio* 34; Dio 38.13; Sallust, *Bellum Catilinae* 50.1). Due to the urban violence of this period (the 60s BCE), the Senate passed a decree banning any *collegia* known to be involved in seditious political activity (Asconius 7c on Cicero, *In Pisonem* 9, *Pro Sestio* 55). During his tribuneship Clodius overturned this decree. Caesar and Augustus also restricted new *collegia* (Cicero, *To His Brother Quintus* 2.3.5; Suetonius, *Iulius* 42, *Augustus* 32.1). Despite the instance of the Bacchanalia (see “Cults, Pagan”), associations with a religious purpose, especially for time-honored cults, were permitted to exist.

Augustus brought the *Compitales* or crossroads associations into the imperial cult; the *Lares Compitales* were renamed *Lares Augusti* and their priests became priests of the imperial cult, typically freedmen. The inscriptions of *collegia* made public and advertised the respectability of their membership and activities. Many religious *collegia* also honored holidays of the imperial cult, such as the birthdays of the emperor and members of the imperial family. Nonetheless, provincial governors were advised and required to investigate potentially seditious *collegia*, in particular secret ones, and shut them down (Digest 47.22). This policy forms a background to the Roman persecutions of the Christians.

Astrologers

The Roman authorities distrusted astrologers and other prophets of various types that were not affiliated with state religion and that they regarded as a threat to public order. Periodically, such persons were ejected from the city of Rome. For persons of high rank, consulting astrologers, prophets, or magicians might incur suspicion of sedition. Treason trials featuring magical “witch hunts” occurred most prominently in the later Empire, but also occurred in earlier periods.

The traditional state religion of Rome featured public divination, or *auspicium*: the attempt to foretell future events using religious/magical methods. The taking of auspices (the examination of a predetermined area of the sky for birds, lightning and other significant atmospheric events) was used to determine lucky and unlucky days for public business, such as holding the assembly or jury trials. Haruspicy, the inspection of the entrails of a ritually sacrificed animal, might be used to sanction major decisions and events. *Auspicium* was a prerogative of Roman higher magistrates (consuls and praetors). These rituals were regarded cynically by some of the late republican elite, men with extensive Greek educations, and were probably manipulated (unlucky auspices could bring political or judicial proceedings to a halt).

Private divination (by persons calling themselves astrologers, prophets, or magicians) was frowned upon. The astrologers were sometimes lumped together with Greek philosophers. Except for the philosophers, many of these persons were of markedly lower social status. They might be representatives of non-Roman, native religions, as with the Druids of Gaul and Britain. The danger was that prophecies would persuade the populace to support a revolt or usurpation; would-be rebels or usurpers might seek such prophecies. Accordingly, the Senate expelled astrologers from the city of Rome many times.

In the empire, elite consultation of astrologers or magicians to discover the succession was regarded with particular suspicion. This predates the alleged “decline of rationality” in the later Empire. In the early first century CE, the young Marcus Scribonius Libo Drusus was accused of treason for magical practices, tried by the Senate, and committed suicide. When Germanicus, the nephew and putative heir of the emperor Tiberius (14–37 CE), died in 19 CE, probably from disease, Gnaeus Calpurnius Piso Pater, the governor of Syria and Germanicus’ host, was accused of poisoning him and working magic against him. Piso was condemned and committed suicide. Ironically, imperial biographers such as Suetonius and the *Historia Augusta* relate many prophecies or portents of emperors’ future rule; astrologers and prophets had to be suppressed due to the public belief in prophecies.

Persecution of magical practices increased in the later Empire. Diocletian and Maximian legislated against *mathematici* (astrologers). In the late fourth century CE, the emperors Valentinian I and Valens persecuted members of the senatorial elite who were suspected of magical practices and of consulting astrologers. Ammianus relates an incident in which several conspirators, hoping to discover the name of the next emperor, used a device that pointed to successive letters of the alphabet to spell (in Greek) THEOD... (Ammianus 29.32) The luckless conspirators believed that one Theodorus would succeed Valentinian and Valens; the real successor was Theodosius I (379–395). Christianity does not seem to have an impact on the credence in astrology and magical practices.

Attila (d. 453 CE)

Attila, the ruler of the Huns, between 434 and 453, posed the most serious threat to the western Roman Empire in the mid-fifth century, and was

defeated at the Battle of the Catalaunian Plains (Châlons) in 451. He was the nephew of Rua, the first Hunnic ruler to unite the diverse Hun tribes in central Europe (ca. 425–433). After Rua's death, Attila and his brother Bleda succeeded him. The Huns supplied barbarian troops to the Romans, contributing significantly to the defense of the empire against other barbarian invasions (though the Hunnic coalition included subject peoples, such as the Gepids and Ostrogoths). However, Attila developed greater ambitions and extracted large subsidies from the Roman government.

Attila commenced a policy of extortion from the eastern imperial government, starting by demanding increased tribute in 435. In 440 Attila raided the Illyrian provinces and sacked cities such as Viminacium, Singidunum, and Naissus. The success of this strike can be explained by the Romans' simultaneous eastern campaigns against Persia and the Vandals, which left the regional field army of the Balkans seriously under-strength. Constantinople agreed to pay double tribute to the Huns, after which they recalled their armies and gradually started refortifying eastern Roman positions in the regions. By 444/445 Bleda had died, probably murdered by Attila, who then became sole ruler of the Huns.

In 447, Attila organized a devastating campaign through Moesia, Thrace, and Greece. He defeated the eastern Roman army in two set-piece battles near Marcianople and Chersonesos. Another humiliating treaty was arranged, which saw further concessions by the eastern Roman government to the Huns and a staggering tribute of 2,100 pounds of gold per annum. In 449, an embassy was dispatched to Attila's camp in Pannonia with the secret aim of assassinating the Hun ruler. The fragmentary history of Priscus of Panion preserves a vivid account of this embassy. Attila easily saw through this strategy and sent the embassy back to Constantinople, but surprisingly enough agreed to a much more favorable treaty the next year. Most likely, he wanted to secure his southern front before launching his invasion of the western Roman Empire.

As pretext for invading the western empire, Attila used an invitation by the western Roman princess Justa Grata Honoria (the sister of Valentinian III) to save her from an arranged marriage, claiming half of the imperial west as his dowry. His armies crossed the Rhine in the spring of 451 and overran northern Gaul until he was stopped by a joint force of the western Roman army and barbarian allies at the battle of the Catalaunian Plains (451).

Attila launched an invasion of Italy the following year. The Huns managed to destroy Aquileia and sack several cities in the Po valley, such as Milan. However, Attila's armies suffered hugely from famine and disease, while an eastern Roman army invaded his Danubian territories, forcing the Huns to leave Italy. Attila was planning an invasion of the eastern Roman Empire in 453, but unexpectedly died during his wedding night with a new wife. In 454, his sons were defeated by the tributary barbarian tribes' revolt from the Huns at the Nedao River. The Huns swiftly disappeared as a major political force in Europe. Nevertheless, during Attila's life the Huns had nearly established a barbarian "empire" in central Europe capable of humiliating both the eastern and western Roman Empires.

Augustus (Emperor) (27 BCE–14 CE)

Born in 63 BCE, Augustus (conventionally termed the first Roman emperor, 27 BCE–14 CE), came to power by bringing an end to the bitter civil war era of 44–31 BCE, finally defeating his last rival Antony in 31 BCE. Augustus then retained that power for more than four decades until his death in 14 CE, gradually creating what we now recognize as the Principate through a series of experiments and compromises. This was largely the result of his success in expanding the Roman Empire while consolidating his power at home. Augustus doubled the size of the empire, adding territories to north and south, east and west. Given that the Romans believed that success in warfare reflected the gods' support, and, conversely, civil war their discontent, Augustus' successful foreign expansion and settlement of domestic affairs was believed to reflect his divinely appointed destiny, reflected in his titles and building program. Augustus imposed extensive stabilizing reforms on the Roman governing class and army, impacting

public and private life (and thus creating new conflicts). He attempted to designate successors and was finally succeeded by his stepson/adopted son Tiberius, but the lack of a stable mode of succession was a persistent disadvantage of the imperial system and source of conflict.

Augustus faced the problem that he was sole ruler of a state that traditionally abhorred kings; his adoptive father Julius Caesar had perished for this reason. Instead of presenting himself as a monarch, he acquired and expanded a number of traditional powers. He held the consulship from 31 through 23, and may also have been granted consular power for life from 19 BCE, but in 27 BCE he formally “restored” the republic. The consuls and other magistrates continued to be elected (or chosen by the emperors) down through the later Roman Empire, though their powers were greatly reduced. In return, Augustus was granted an unprecedented extent of proconsular *imperium*, overriding that of regular governors (and thus termed *imperium maius*). In 23 BCE he was also granted *tribunicia potestas*: This gave him authority to summon the Senate whenever he wanted and submit a motion to it; summon the popular assembly and propose legislation; impose a veto on the actions of other magistrates; intervene on behalf of citizens who were being unfairly treated by other magistrates; and force citizens to obey his orders, the right of sacrosanctity traditionally held by the tribunes of the plebs. In addition to these traditional powers, in 27 he was granted a new name, that of *Augustus*, by which he was known to posterity. The Latin word *augustus* had many connotations, including “majestic, venerable,” but implicit in it was the idea of increase (from the Latin verb *augeo*), an increase that was acted out under Augustus not just in general terms, in Rome’s increase in prosperity, but and specifically in terms of increasing the boundaries of the Roman Empire. To his titles were added *pontifex maximus* (chief priest of the Roman state) in 12 BCE and *Pater Patriae* (“Father of the Fatherland”) in 2 BCE.

The Prima Porta Augustus. This full-length statue emphasizes the emperor's role as symbolic commander-in-chief, though in practice Augustus deputed field commanders, often imperial family members such as Tiberius (the future emperor), Drusus, and Germanicus. From the Villa of Livia at Prima Porta, now located in the Vatican Museum, Italy. (Leemage/Corbis)

Having returned to Rome and celebrated his triple triumph in 29 BCE, Augustus turned to expanding the Roman Empire. Early campaigns consolidated his conquest of Egypt. The boastfulness of the prefect of Egypt, Cornelius Gallus, in celebrating his penetration into southern Egypt, led to his disgrace and suicide in 27/26 BCE. As a result, after the triumph of Cornelius Balbus in 19 BCE celebrating victory over the Garamantes in North

Africa, no further nonimperial commanders celebrated triumphs. Augustus probably vetoed on a technicality the dedication of the *spolia opima* (the spoils offered by a Roman general who had killed an enemy leader in single combat) by Licinius Crassus in 30/29 BCE. Augustus made clear that he intended to be sole ruler and would not tolerate any rival competitors.

During the period from 26 to 7 BCE Augustus was absent from Rome for several years. As with his actual combat during the civil wars, it is not clear that Augustus himself fought in person during his campaigns. Indeed, even after the pacification of the Iberian peninsula in 25 BCE, the Cantabri and Astures revolted as soon as Augustus left Spain, and it was Agrippa who finally managed with some difficulty to suppress the Cantabrian rebels in 19 BCE. Nonetheless, his campaigns in Gaul and the Iberian peninsula during the 20s were celebrated with great fanfare upon his return to Rome and he was credited with establishing Roman control of western Europe as far as the Atlantic, which was regarded by the Romans as none other than the great Ocean bordering the edge of the world. Given that Augustus steadfastly refused to celebrate any further triumphs, alternative ways of commemorating his military success were devised. The *Ara Pacis Augustae* (“Altar of Augustan Peace”) was vowed by the Senate on the day of Augustus’ return from the west on July 4, 13 BCE, and dedicated on January 30, 9 BCE. The altar was situated within an enclosure imitating the shrine of Janus Quirinus, and displayed a complex decorative scheme, reflective of Augustan ideology. This was the first known instance of an “August(an)” deity: the new deity’s title encapsulated the idea that Rome could now enjoy a special relationship with the gods specifically through the mediation of Augustus.

In addition to these conquests, a great diplomatic coup was represented as if it had been a military victory. In 20 BCE, Augustus secured the return of legionary standards from Persia, which had earlier been captured from Crassus and Antony. He achieved this by a combination of bargaining with the Persian king Phraates IV over the return of his son, who had been kidnapped and delivered into Augustus’ hands; by traveling to the region in person; by encouraging the claims of the Persian pretender Tiridates; and by the presence nearby of a Roman army commanded by Tiberius. The return of the standards was celebrated in poetry, publicized on coinage, and commemorated on a triumphal arch in the Roman Forum. The famous Prima Porta statue of Augustus is thought to allude to this episode. The

Senate dedicated an altar to Fortuna Redux (“Fortune the Home-Bringer”) at the end of 19 BCE, to celebrate Augustus’ return to Rome after his absence in the east since 22 BCE.

After 7 BCE, Augustus did not leave Italy again, instead delegating the task of commanding the armies to junior members of his family and other leading Romans. Their campaigns, however, were fought under his auspices, meaning that he was ultimately regarded as responsible for their successes. His two stepsons Tiberius and Drusus were conspicuous in their achievements, conquering swathes of Germany and the Balkans, and subduing the Raeti and Vindelici in the Alps, completing the pacification of the Alpine tribes. The massive Tropaeum Alpium at la Turbie (near Monaco) was a victory monument commemorating this, built in 7/6 BCE, with its inscription listing the names of over forty conquered tribes. Drusus received the honorific title “Germanicus” in recognition of his success in the Rhineland, but he died after falling from his horse in 9 BCE. Augustus’ grandson, Gaius, born in 20 BCE whom he adopted as his son in 17 BCE, was sent to the eastern frontier in 1 CE, where he campaigned in Armenia. Despite the flattering optimistic account of this in the *Res Gestae*, these attempts to impose a settlement in Armenia were doomed, with Gaius himself dying from a wound in 4 CE, and the problem of Armenia and Persia rumbled on into the reign of Tiberius. Augustus also designated Gaius’ brother Lucius, born in 17 BCE, as his potential heir, but Lucius also died in 2 CE, leaving Tiberius the most likely heir. Though the mature and competent Tiberius succeeded Augustus without opposition, the succession from one emperor to another was never assured, in contrast with a hereditary monarchy.

The last decade of Augustus’ lifetime witnessed military reverses. A serious revolt in the Balkans in 6–9 CE (known as the Pannonian revolt) threatened Rome’s stability, putting military manpower under such pressure that emergency conscription was put in place into the legions, even of freedmen. This sense of crisis was only further increased by the massacre of Quinctilius Varus’ three legions in the Teutoburg forest of Germany in 9 CE. It is against this background that we should place reports that Augustus advised Tiberius not to expand the empire further. Nonetheless, by the end of his life, Augustus was able to claim that he had conquered the whole world, and his conquests figured large in the *Res Gestae*. He declared that in addition to newly conquered territories, Rome’s influence had spread

through diplomacy and friendship even as far as China, India, and Britain.

Several factors underpinned Augustus' military success. First of all, Augustus established the army on a secure financial footing, regularizing conditions of service and thus discouraging soldiers' future support of potential rival emperors. The *Res Gestae* boasts of giving immense sums as donatives to soldiers: in 29 BCE, 120,000 veterans received 1,000 sesterces each. Though soldiers had long received a *stipendium* (wage), Augustus ensured that on completing their service, veterans were given generous allocations of land or cash. He spent 600,000,000 sesterces for Italian estates, and about 260,000,000 for land in the provinces, followed by cash payments of 400,000,000 sesterces. In 6 CE he established a new military treasury, the *aerarium militare*, to meet the cost of rewards on retirement for veterans, devoting to it a capital sum invested from his own funds, which was then topped up by new taxes. This continued to suggest that the soldiers owed their livelihood to Augustus in person. Second, Augustus fundamentally transformed the character of the Roman army, changing it from an ad hoc force raised by individual commanders as need arose into a permanent professional force. Third, Augustus reorganized the Roman army for long service, decreasing the availability of veterans for rivals' campaigns. In the Roman Republic, soldiers were recruited for 6 up to 16 years at a time. Veterans of one tour of duty were still young and vigorous men who readily enlisted again; thus Octavian himself and Antony had recruited Caesar's veterans. Soldiers were now required to provide a lifetime of service, praetorians for 12 years, extended to 16 years in 5 CE; legionaries for 16 years, extended in 5 CE to 20 years and later to 25 years. A legionary recruit of twenty would be forty or more when he was discharged, worn out by a strenuous and dangerous career and unlikely to fight again. The soldiers swore an oath of loyalty to Augustus himself: gone were the days of competition between rival generals. Lastly, Augustus was fortunate in his commanders: the military ability of individuals such as Agrippa, Tiberius, and Drusus, and their loyalty toward Augustus played no small part in securing his power within the state.

Augustus also changed the role of the Roman elite in military affairs, besides restricting triumphs and military glory to the imperial family. He divided the provinces into "public" provinces, in which few no legions were stationed, and "imperial" provinces, which had active legions. Proconsular governors now were restricted to public provinces; these governorships

conferred greater honor but were less likely to offer military power. Imperial provinces now had legates (*legati Augusti*) for governors, ranking above the legionary legates (commanders) of individual legions. Augustus restricted the prefecture (governorship) of Egypt to equestrians to discourage exploitation of Italy's grain supply by potential usurpers. In all cases the emperor could override his governors. The result was that, despite grumbling by traditionalist historians such as Tacitus, the Roman senatorial aristocracy played a much smaller role in military affairs. A greater source of elite resentment was Augustus' marriage legislation, requiring members of the upper orders to marry and procreate or face financial penalties, and criminalizing adultery.

Military glory was central to the Augustan regime. Poets praised his ending of the civil wars and expansion of empire. Coins, inscriptions, art, and architecture all paraded imperialist images of conquest, and the message of world conquest visualized via figures of Victory, captured long-haired barbarians, and spoils of war was disseminated into the newly conquered provinces. At Rome itself, the ceremonial closing of the gates of Janus declared the outbreak of Augustan peace throughout the world.

Aulus Caecina (d. 79 CE)

Aulus Caecina was a Roman senator and officer involved in the War of the Four Emperors (69 CE). With Fabius Valens, Caecina initially supported the acclamation of Vitellius, governor of Lower Germany, as emperor. Caecina invaded Italy in the name of Vitellius, winning a victory against the forces of the emperor Otho at Bedriacum. After occupying Italy, Vitellius rewarded Caecina with a consulship, but Caecina betrayed him by declaring for Vespasian, who had been acclaimed emperor in the east. Caecina was richly rewarded by Vespasian, and spent 10 years in imperial favor before being executed on suspicion of conspiracy in 79 CE.

Aurelian (Emperor) (270–275 CE)

A Roman emperor (270–275 CE) during the third century crisis, Lucius Domitius Aurelianus was born in Dacia Ripensis in 214 CE, the son of a tenant farmer. He joined the Roman army, rising to the position of senior general under the emperor Gallienus. Together with other leading officers, including the future emperor Claudius II Gothicus, he conspired to murder Gallienus at Milan in 268 CE. Claudius II died less than two years later after contracting the plague, to be succeeded by his brother Quintillus. But the army preferred Aurelian, who claimed the throne for himself in September 270 CE.

Aurelian's reign was not without its problems. He faced several rebellions from senators and other officials, including the moneyers' revolt at Rome led by the financial administrator Felicissimus in 271 CE. But his reputation as a successful military leader was well deserved. Shortly after his accession he repelled assaults on Italy by the Alamanni and Juthungi, and by the Vandals in Pannonia. In 272 CE he was engaged in campaigns against the Goths, who had invaded the Danubian provinces; this resulted in the decision to abandon the province of Dacia across the Danube that had been established by Trajan. In its place, Aurelian created two new Dacian provinces from the territory of Moesia (though some scholars date this to 274 CE).

In the same year, he turned his attention to Zenobia, queen of Palmyra, who had claimed authority over the eastern provinces, including Egypt. She was defeated in battle at Antioch and Emesa before being captured while trying to escape to Persia. In late 272 CE, Aurelian travelled to the Balkans to fight the Carpi, but was forced to return to the east to suppress a second Palmyrene rebellion in 273 CE. Zenobia was exhibited at Aurelian's triumph in Rome, but was permitted to remain a free woman and even married into the senatorial aristocracy. In 274 CE, Aurelian embarked on a campaign against the Gallic Empire in the west. He defeated the forces of Gaius Esvivius Tetricus, the last ruler of this breakaway state, in battle on the Catalaunian Plains. Tetricus surrendered and later became the governor of a region of Italy. In less than five years Aurelian had restored the Roman Empire to its former extent, and became known as the *restitutor orbis* ("restorer of the world").

His legacy included construction of the Aurelian Wall, which enveloped

the city of Rome in a 19 kilometer circuit. Flanked by impressive towers every 30 meters, the wall (parts of which still stand today) demonstrated Aurelian's ability to protect the citizens of the empire. Aurelian also constructed a new temple of Sol Invictus (the "Unconquered Sun") in Rome and attempted to reform the coinage. He embarked on a Persian war in 275 CE, but was murdered on the way to the front as a result of a plot hatched by one of his secretaries. Aurelian proved himself one of the most successful soldier emperors of the third century in his efforts to reunify the empire while tackling barbarian incursions. However, he earned a reputation as a harsh ruler, which was one of the factors that prompted his assassination.

Auxilia

The *auxilia* or "helping" troops were infantry and cavalry units, originally recruited from non-Roman peoples but commanded by Roman officers and subject to Roman military training and discipline. An innovation of the last century BCE, they are most prominent in the first three centuries CE.

Auxiliary units, which were smaller than legions, might be deployed alongside or in place of legionary forces and comprised the entire garrison of some small provinces. Auxiliary *alae* ("wings" or cavalry regiments) or cohorts (infantry units) might comprise 480 to 500 men each; introduced in the Flavian period, milliary *alae* or cohorts contained 800 to 1,000 men each. Mixed *cohortes equitatae* contained 120 cavalry and 480 infantry. The total number of *auxilia* in the Flavian period is estimated as 180,000 men.

The recruitment of non-Italian units by treaty agreement with Rome predated the first century BCE, but Julius Caesar and Augustus employed

auxiliaries on a more permanent basis, incorporating them into the Roman army. Early auxiliaries were recruited from non-Italian peoples from regions recently incorporated into the empire. These recruits retained traits of “warlike peoples” and did not yet possess the Roman citizenship. After completing 25 years of service, the Roman citizenship was granted to auxiliaries upon their discharge, along with *conubium* (the right to marry) with their wives or future wives. These privileges are attested in many surviving military diplomas, copies of official documents engraved on bronze tablets.

Though the titles of auxiliary units often denoted their original ethnic origin, and were retained, the legal status and ethnic composition of the auxiliaries themselves shifted as the provinces became more Romanized. By the second and third centuries CE, many auxiliaries were already Roman citizens on enlistment and bore Roman-style names. The citizenship ceased to be an inducement to recruitment well before the emperor Caracalla (sole reign 211–217) granted the citizenship to nearly all inhabitants of the empire in 212 CE.

Auxiliaries were commanded by Roman citizen officers (usually equestrian prefects) and were subject to the Roman military oath, training, and discipline. They were thus distinct from *numeri*, ethnic units that retained local fighting specialties, such as Syrian bowmen or slingers from the Balearic Isles (off the coast of Spain). Besides the citizenship issue, the main distinctions that made auxiliaries “second-class” troops was command by equestrians, not senators; a longer period of service; and a lower rate of pay, perhaps 5/6 the legionary rate. However, auxiliary cavalrymen received higher pay to help maintain their horses and grooms (usually slaves). In the provincial setting, service as an auxiliary *equus* (cavalryman) might be more attractive than legionary service.

It has been suggested that Roman battle tactics deployed auxiliaries differently from legionaries, exposing the former to greater danger, but this point is controversial. It assumes that the legionaries became less “warlike,” being recruited from Italian and more Romanized provincials. Trajan’s Column depicts some differentiation of legionary and auxiliary tasks, emphasizing the legionaries’ role as builders and engineers and the auxiliaries as fighters; however, this may only suggest that the auxiliaries were not trained as engineers.

It is difficult to trace the history of auxiliary units in the later Roman

Empire, due to the later Roman army's restructuring as a central field force of cavalry (the *comitatenses*) versus lower-status border troops (*limitanei*).

Avidius Cassius (d. 175 CE)

Avidius Cassius was a Roman senator and general. The son of an equestrian officer, he entered the Senate and served as a commander in the Persian War (162–166 CE) of Lucius Verus. While Verus remained in Antioch, Cassius successfully captured the Persian cities of Seleucia and Ctesiphon. After the war, he was appointed consul and governor of Syria, later receiving supreme authority over all the eastern provinces. In 175 CE, Cassius claimed the purple when he heard that Marcus Aurelius had died, and did not relent when this rumor turned out to be false. His usurpation lasted only three months before he was killed by one of his own men. He is idealized in the *Historia Augusta*'s unreliable Life of Avidius Cassius.

Balbus, Lucius Cornelius (ca. 21–13 BCE)

Lucius Cornelius Balbus (the younger), proconsul of Africa in 21/20 BCE, achieved a victory over the Garamantes and was the last private citizen to celebrate a triumph, marking a change in the nature of the triumph in the imperial era. Balbus was not a Roman citizen by birth; from a wealthy family of Gades (Cádiz) in Hispania Baetica (southern Spain), he and his homonymous father received the Roman citizenship due to Julius Caesar's patronage. Balbus senior was the first consul born outside Italy. Balbus junior celebrated his triumph over the Garamantes of North Africa (Libya) on March 27, 19 BCE, the last entry in the *Fasti Capitolini* at Rome. After the triumph of Balbus, only emperors and their family members were permitted to celebrate triumphs. Senators not belonging to the imperial house were permitted triumphal ornaments, the highest honor they could receive for victories. Balbus also dedicated a theater and associated portico on the Campus Martius at Rome in 13 BCE to commemorate the occasion.

Bandits and Brigands

Bandits and brigands were a pervasive source of low-level violence in the Roman world. They resulted from the relative inability of the Roman state to exert power over vast rural spaces. Banditry constituted an escape for the bored, the entrepreneurial, or the local power broker. It provided peasants, fugitive slaves, and other refugees from Roman society with a place on the periphery of the state.

Banditry was pervasive during the Roman Republic and the Roman Empire. Many sources mention bandits setting upon travelers and leaving them for dead. Pliny the Younger recounts the disappearance of one Metilius Crispus, who was traveling to the frontier to take up a centurionate (*Letters* 6.25), as if it was not unusual for people to vanish on such journeys; another friend, Robustus, had also disappeared. Legal codes classify banditry with other extenuating circumstances, such as floods, hurricanes, volcanoes, and other acts of God. Comparative analysis of other premodern states also suggests that banditry was a pervasive, structural problem.

In terms of the actual practice of banditry, little can be gleaned from the ancient sources. Bandits formed the nucleus of rebellions in the Roman Empire. This was especially true of the Jewish War of 66–70. Banditry was undertaken by men who operated in small groups far from urban settings and who employed natural features of the landscape, such as mountains and swamps, to evade pursuit. Their primary targets were travelers, and they probably stole from farmers in the region that they operated. There is some evidence of collusion between large landowners and bandits. Large landowners may have employed bandits to enforce their will in rural areas.

Since banditry was such a pervasive threat, the apprehension and execution of bandits was one of the primary duties of a Roman governor. In provinces with military garrisons, Roman legions were responsible for catching bandits and guarding the roads. Roman legions were stationed not only to protect against external enemies, but also to maintain internal security.

Romans viewed banditry as a catch-all term for illegitimate antistate violence. The relevant passage in the Digest of Justinian declares that “Enemies are those who have declared war on us, or whom we have declared war on. All the rest are bandits or plunderers” (Digest 60.15.86). Indeed, the term banditry was linguistically imprecise. It could be defined as

any illegitimate form of violence. This imprecision led to the use of bandit as a term of invective, directed against political enemies.

These invectives appear to emerge primarily in times of turmoil and rebellion, when it was difficult to determine who was fighting for the state and who was fighting against it. In the late Roman Republic, the term bandit was thrown around loosely in political discourse. Cicero called the most powerful men of his time period brigands, using this terminology to delegitimize their use of force. The Roman view of banditry gave these accusations their force. It is important to understand that in Roman sources, the use of the word bandit does not always mean that the person in consideration was a bandit. Two egregious examples suffice: in the *Res Gestae Divi Augusti*, the emperor Augustus termed Sextus Pompeius and his followers “pirates” (bandits who operated at sea); in 285 CE, the emperor Diocletian (284–305) raised to Caesar his comrade Maximian to combat the “bandits” Aelianus and Amandus, who struck their own imperial coins. This ideology of banditry found in Roman sources existed in tension with the actual practice of banditry, by persons of far lower social status.

Bar Kochba Revolt (132–135 CE)

The Bar Kochba revolt was the second Roman-Jewish war. It was fought from 132 to 135 CE in the province of Judaea. The causes of this war were rooted in the political situation that followed the first Jewish War of 66–70 CE. After 70 CE, the Romans annexed Judaea, making it into a Roman province with an equestrian governor. The Tenth Legion (Legio X Fretensis) was stationed in Jerusalem. In the 120s, another legion was brought into

Palestine, to be replaced by Legio VI Ferrata in 130, which was stationed in south Galilee.

In 130 CE, the emperor Hadrian visited the province of Judaea and ordered the city of Jerusalem to be refounded as the pagan city Aelia Capitolina. He built a temple to Jupiter Capitolinus, the chief Roman god, on the site of the Jerusalem Temple, insulting the defeated Jewish God. This was presumably the main cause of the rebellion. Another literary source, the highly tendentious *Historia Augusta*, suggests that Hadrian banned circumcision, precipitating the revolt, though most historians consider this unlikely. This could have incited a revolt among the Jews, because the rite of circumcision was fundamental to Jewish identity. Other factors may have been resentment from the first war, and messianic, apocalyptic fervor, as evidenced by Jewish literature from the interwar period.

Simon Bar Kochba led the revolt, styling himself the nasi, the rank below king among the Jews. The course of the revolt is impossible to reconstruct, based on the sources that have been preserved. Bar Kochba's army enjoyed some initial success, routing the forces of the Roman governor Tinnieus Rufus. To crush the rebellion, Hadrian sent seven more legions to join the two there. These were placed under the command of Julius Severus, the former governor of Britain, who was transferred into the province to quell the rebellion.

Bar Kochba's name means "son of a star," suggesting that the rebellion had messianic overtones. His army built a vast array of underground caves and fortifications, such as those found at Beth Guvrin, from which they harried the Romans. Some of Bar Kochba's letters have been discovered, revealing him to be a petty, cruel, and ineffective leader. In Christian literature, Bar Kochba is portrayed as a persecutor of the early Church. The revolt probably had other leaders, but the sources do not preserve their names.

In response to the Bar Kochba revolt, the Roman army annihilated the district of Judaea. Archaeological evidence suggests that the district was depopulated after the war. Most of the population was slain or enslaved. The war culminated with the siege of Betar, a city southeast of Jerusalem, where Bar Kochba died. In rabbinic literature, the Bar Kochba revolt is remembered as a catastrophe on par with the destruction of the Temple during the First Revolt.

This rebellion had massive costs in manpower and money for the

Roman Empire. The Roman army was utterly unprepared for the revolt. More seriously, Legio XXII Deiotariana appears to have been disbanded, because of heavy losses. The suppression of the revolt was celebrated widely by the Romans, and a triumphal arch honoring Hadrian was erected at Tel Shalem, south of the city of Scythopolis, at the edge of Judaea. Hadrian renamed Judaea Palestine after this rebellion, to punish the Jews.

Barbarians

“Barbarian” in Greek and Roman sources indicates people of non-Greek and non-Italic ethnicity, who were considered foreign and alien. The Greeks applied the term *barbaroi* to Near Eastern peoples whose languages they found incomprehensible, sounding like “bar bar” to Greek ears. The early Greek historian Herodotus depicts many non-Greek peoples, tending to stereotype their cultures as inverting Greek social practices and customs. Herodotus’ *Histories* focuses on the Greek-Persian wars (490–479 BCE) and is relatively fair to the Persians; other Greek texts from the early Classical Period show that the Greeks regarded the Persians as effeminate, luxurious, and inevitably defeated by tougher, more masculine Greeks. The stereotype of “eastern” barbarians as effeminate had a long subsequent history, applied to the Hellenistic Greeks themselves by the Romans during the period of the Roman conquest of the Hellenistic east. Stereotypes however could run both

ways; the Romans themselves might seem barbarous to the Greeks, setting up a pattern of ambivalence in which the Romans were eager to acquire Classical Greek culture but regarded contemporary Hellenistic Greeks as decadent.

Greco-Roman views of nonclassical peoples in northern and western Europe (the Balkans, the Danube basin, Alps, Germany, Gaul, Spain, and Britain) were framed differently. The dominant cultures in these regions of pre-Roman Late Iron Age Europe were Celtic and Germanic. These cultures were patriarchal and hierarchical but, in contrast with the Near East, were less organized and complex than Greek and Roman civilizations. The Greeks and Romans viewed the Celts and Germans as representing an earlier stage of development, societies of warriors and raiders. As such, the Celts and Germans were stereotyped as courageous and bold warriors but lacking in education, prudence, and self-control. They were violent and prone to anger. The Romans regarded the northern barbarians as a potential threat due to their impulsivity and their propensity to raiding.

Other “barbarian” peoples whom the Romans encountered were the Carthaginians and the Jews. The Carthaginians were of Phoenician origin, a Semitic people in religion and language, with a complex state organization. The Romans respected the Carthaginians but stereotyped them as devious and untrustworthy. The Greeks and Romans regarded the Jews as more alien because the Jews were strict monotheists, worshipping only the Jewish God.

Images of “barbarians” were transmitted in various genres: in historiography, as with Herodotus above; in ethnography, the genre describing various peoples and their customs; and in visual arts, for instance Roman triumphal art. These images tended to be frozen in time, changing little even though the ethnic composition and cultures of Roman provincial society changed greatly over the centuries and the peoples beyond the frontiers were influenced by contact with Greco-Roman civilization. The Roman elite drew on such static images in formulating their strategy toward nonclassical states and peoples.

“Barbarian” might also be used very loosely by the Greco-Roman urban elite as synonymous with “uncultivated.” For instance, Cassius Dio criticizes the decision of Septimius Severus (emperor 193–211) to replace the Italian praetorians with Danubians promoted from the legions, describing the new praetorians as “most savage in appearance, most terrifying in speech, and

most boorish in conversation” (Dio 74[75].2.6). Classical authors might term “barbarian” emperors whom they regarded as brutal and uncultivated, such as Maximinus I (235–238) or Galerius (Caesar 293–305, Augustus 305–311).

The heavily loaded and often negative semantics of “barbarian” make it a difficult term for modern scholars to use in describing the non-Greek and non-Roman peoples of the classical world, even though Greek and Latin sources often do so. In the Roman section of *Conflict in Ancient Greece and Rome*, we have often used other and more specific terms, for example “Germans” or “Germanic peoples” for “barbarians” in late antiquity. When “barbarian” is used in the articles, it is a generic term and should not be viewed as imparting a value judgment.

Bedriacum, Battles of (69 CE)

The First and Second Battles of Bedriacum (also called the First and Second Battles of Cremona) were important turning points in the War of Four Emperors (69 CE). They occurred in northern Italy in the vicinity of the small town of Bedriacum and the larger city of Cremona, hence the variant names.

In the First Battle of Bedriacum (April 14, 69 CE) the forces of Vitellius,

Rhineland legionaries commanded not by Vitellius himself but by his legates Aulus Caecina Alienus and Fabius Valens, approached Bedriacum. The forces of emperor Marcus Salvius Otho, led by Otho himself and his generals Salvius Titianus and Annius Gallus, numbered about 10,000, and were drawn from the troops quartered in Italy, including the praetorians and urban cohorts. As was still usual for emperors at this time, Otho chose not to fight in the battle in person, withdrawing to nearby Brixellum. The Vitellians defeated the Othonians. When Otho heard the news, he chose to commit suicide on 16 April, so as to spare his army further battle. Most of his officers went over to Vitellius.

In the Second Battle of Bedriacum, on October 24–25, the Vitellians fought against the Flavian forces led by Antonius Primus, comprising Legiones III Gallica, VII Claudia, VII Galbiana, VIII Augusta, and XIII Gemina. The Vitellians were led by Caecina and Fabius Valens and comprised the remaining Rhineland troops brought to Italy, along with urban troops that had gone over to Vitellius. Tacitus depicts the Vitellian legionaries as debilitated by their stay in Rome, having been exposed to the city's diseases, and weakened by Vitellius' failure to enforce discipline and training (Tacitus, *Histories* 2.93). The battle, depicted as intermittent and chaotic, lasted through the night, but Primus' men were clearly the victors. Elated by their victory, the Flavians both stormed the Vitellian camp, and besieged and sacked Cremona in reprisal for the Cremonese support of Vitellius. The Flavian sack of an Italian city was regarded as one of the most atrocious deeds of the war (Tacitus, *Histories* 3.33–34).

Bellum Iustum

The concept of “just war” in the Western tradition has roots in Biblical, Greek, and Roman traditions. In all three cultures, there is an attempt to connect just war to religious and legal ideals. Still, in Plato’s *Republic* (1.338–347c-e) we have Thrasymachus argue that “justice is in the interest of the stronger.” The concept is echoed in Thucydides’ Melian Dialogue in the *History of the Peloponnesian War* (5.89): “the strong do what they will, the weak do what they must.” From Cicero’s *De Officiis* 1. 11.36 and Livy 1.32 we learn that the Roman tradition allowed no war to be “just” unless its beginnings first adhered to the following legal and religious processes. The chief fetial priest, the *pater patratus*, traveled to the Roman frontier to approach the enemy and demand restitution for the perceived wrong that initiated the confrontation. According to Livy, the priest must approach the first man he meets at the border, the next man he meets on the way to the city center, a man at the gates of the city, and finally, someone at the enemy’s forum. If, after approaching all these people no satisfactory restitution results, there follows an official declaration of war on behalf of the Senate and People of Rome. The examples from Cicero and Livy demonstrate a legalistic concern for following proper procedure in negotiation with the enemy and giving fair warning. The college of fetial priests served Jupiter, the chief state deity of Rome. Part of their charge was sustaining right relationships with foreign powers and following proper procedure in diplomacy. Cicero argues that discussion or negotiation must precede war because discussion is the “characteristic of man” while warfare is the characteristic of “the brute.” The only excuse for going to war, he wrote, “is that we may live in peace unharmed” (1.11.35). Therefore, the ritual demands for restitution reflect that Rome went to war to right wrongs committed against the state and her people. There was also a desire to engage in diplomatic negotiations to avoid war.

While these religious rituals and diplomatic overtures were the ideal, in practice, the just cause for Roman warfare related to the interests of state. Political concerns trumped religious, ethical, and legal conventions. St. Augustine refined the concept in a Roman Christian context in the fifth century CE, crafting a formula that required warfare be conducted by a just authority, for a just cause, with right intention (creating and keeping the peace), and only as a last resort after all diplomatic initiatives had been

exhausted (*Quaestiones in Heptateuchum* 6.10). We can see Cicero's influence in Augustine's philosophy that, in turn, shaped the work of Thomas Aquinas in the thirteenth century.

Boniface (d. 432 CE)

Boniface commanded Late Roman Africa as *comes Africae*, ca. 422–432. Boniface distinguished himself at Massilia by wounding the Visigothic king Athaulf in 413. He was then stationed in Africa as a tribune of Gothic auxiliaries, where he enforced order over native tribes (ca. 416–421). In 422, Boniface was assigned a subordinate command under the *magister militum* Castinus against the Vandals in Spain, but was dismissed by the latter in Italy. Boniface married the Visigothic princess Pelagia at this time, who granted him a warrior retinue. Returning to Africa, Boniface achieved the position of *comes Africae* through the patronage of the empress Galla Placidia, sister of the emperor Honorius (395–423) and mother of the emperor Valentinian III (425–455).

When Placidia and Valentinian were exiled, prior to Honorius' death, Boniface played a pivotal role to restore them. He safeguarded Africa during the civil war (424–425) between the western usurper Johannes and eastern Roman armies. After Johannes' execution, Valentinian III was installed as the western Roman emperor. As a result Boniface was awarded the dual position of *comes Africae* and commander of the imperial guard (*comes domesticorum*) in 425. The new *magister militum* Felix conspired against Boniface, declaring him a traitor in 427. Forced to fight, Boniface defeated

one Italian army, but was forced by a second army to retreat into the interior of Mauretania. Boniface was pardoned by Galla Placidia in 428 and reinstated as *comes Africae* to combat the Vandal invasion of Africa in 429. Though defeated by the Vandals, Boniface managed to successfully defend the city of Hippo against them in 430–431. In 432, Boniface was recalled to Italy by Placidia and appointed *magister militum* to oust Aetius from power. Boniface defeated Aetius at the battle of Rimini but was fatally wounded. The Romans were unable to displace the Vandals from Africa and were forced to recognize Vandal possession of the North African provinces.

Boudicca (d. 61 CE)

Boudicca, queen of the Iceni (a British people in the region of East Anglia), led the Iceni and Trinovantes tribes in revolt against the Romans in 60/61 CE. Other tribes, though their names are unknown, are believed to have fought with Boudicca in addition to the Iceni and Trinovantes. Boudicca was said to be one of many women to lead British tribes and even to command British armies. Her role as a warrior queen was a foreign and frightening concept to the Romans. Her position as the leader of a rebellion that sacked three Roman settlements was shameful to the Romans.

Prasutagus, husband of Boudicca, left his kingdom to his two daughters and the emperor Nero (54–68 CE). Roman maladministration of the British provinces, including Roman tax farmers' recall of loans, was a major cause of the revolt of the Iceni, culminating in Roman soldiers' flogging of Boudicca and rape of her two daughters. These abuses forced the Iceni into a desperate situation. Boudicca became the leader of a campaign that stretched from Camulodunum (Colchester) to Londinium. Britons destroyed

the Roman veteran colony of Camulodunum, including the temple of the deified Claudius. Verulamium (St. Albans) and Londonium were also destroyed in the uprising. The Britons slaughtered the infantry of the Ninth Legion. According to Dio (62.1.1), the Boudiccan Rebellion killed 80,000 Romans. However, it was soon suppressed. In Britain, the Roman legions typically concentrated their efforts in one territory at a time. At the time of the Boudiccan Rebellion, the legions were on campaign in North Wales. The Roman legions were able to defeat Boudicca in organized combat at an unknown location. To avoid capture, Boudicca committed suicide by poison.

Breviarium Totius Imperii

The *breviarium totius imperii* was a document created at the order of the emperor Augustus and bequeathed to his successor Tiberius (14–37 CE), describing the size and disposition of imperial forces, the revenue and expenses of the empire, and the direction of imperial foreign policy. It is not preserved and is attested by the imperial biographer Suetonius, the historian Tacitus, and the historian Cassius Dio in slightly conflicting accounts. Nothing is known of how it was compiled, presumably from military strength reports, or whether it was updated in subsequent reigns.

Augustus had reduced the number of legions to 28 (25 after the Varian disaster), but had placed on a regular footing the Praetorian Guard, urban cohorts, and *vigiles* or fire watch, based in the city of Rome; the fleets at Misenum and Ravenna; and the *auxilia* in the provinces. It is likely that the

breviarium enumerated these forces, but the level of detail is unknown.

The most controversial aspect of the *breviarium* was Augustus' alleged directive to Tiberius not to extend the boundaries of the empire further. Some scholars of Roman grand strategy have interpreted this directive too broadly to suggest that after the Roman Republic's aggressive imperialism, imperial Rome shifted to a defensive concept of grand strategy. After Augustus, such a defensive strategy is commonly attributed to Hadrian (117–138). However, though after the 20s BCE he did not campaign in person, Augustus' public image was hardly a pacific one. His presentation of *Pax* (Peace) as a deity (in the famous *Ara Pacis* monument in Rome) celebrated the end of civil warfare, not the end of Roman conquest of external enemies. Augustus' reign added parts of Germany and the Balkans and commemorated the recovery of captured Roman standards from Persia, expunging the disgrace of the defeat of Crassus at Carrhae (53 BCE). Before his accession, Tiberius himself had commanded in the field and had extensive military experience, as did Germanicus, Tiberius' nephew. Germanicus was permitted to wage a punitive expedition against Arminius, avenging the Varian Disaster (9 CE) by defeating Arminius at the battle of Idistaviso (16 CE).

Subsequent emperors did not refrain from military conquest. Claudius' reign saw the lasting conquest of Britain. One of its generals was the future emperor Vespasian (69–79), who rose to power with his defeat of the Jews in the Jewish War. Vespasian's son Domitian (81–96) followed by Trajan (98–117), achieved the Roman conquest of Dacia (modern Romania). If the *breviarium totius imperii* advised Tiberius not to extend the boundaries of the empire, this policy may have been only of immediate application based on straitened financial circumstances. The loss of three legions in the Varian disaster of 9 CE had been very costly. Augustus and Tiberius kept many legionaries in service past their discharge dates to avoid paying pensions, contributing to the mutinies on the Rhine and Danube in 14 CE.

Bribery and Corruption

In modern nations, which emphasize the rule of law and rational bureaucracy, bribery, and corruption—defined as extrainstitutional exchange of material favors for goods, services, or access to office or power—are regarded as indexes of misgovernment. Modern government bureaucracies are likely to have elaborate rules restricting or prohibiting gifts to office-holders and donations to political campaigns. Furthermore, modern governments are able to exert effective surveillance of office-holders and officials. Such standards, rules, prohibitions, and surveillance were much less prevalent in the ancient world.

The late Roman Republic and the Roman Empire were predominantly patronage societies with only partially developed bureaucratic institutions. In such societies, power and influence were exerted by the transfer of gifts, whether horizontally (between peers), upward (as in tribute to a ruler), or downward (to clients or dependents). Such gifts were socially expected: a Roman noble showed hospitality toward fellow aristocrats, a patron gave gifts to his clients or represented them in court, and a Roman magistrate bestowed gifts on the populace such as games and public amenities. In return, the gift-giver received political support and votes. For a politician to blatantly, buy his way into office was not as routine as has been thought (despite Sallust's *Romae omnia venalia esse*, "at Rome all things are for sale," *Jugurthine War* 8) but the bestowal of gifts/bribes was part of the route to power.

In Classical Athens, the system of office-holding provided some checks against patronage and corruption. Officials underwent formal scrutiny (*dokimasia*) before they entered office, and were subject to another examination (*euthyne*) on leaving office, intended especially to ensure that they had not enriched themselves illegally. The Roman Republic's political system lacked such built-in checks.

By the middle and late Republic, patronage became a source of undue

political influence, and some steps were taken to check it. In the early and middle second century BCE, a series of sumptuary laws probably targeted horizontal influence by restricting expenditure on luxury foods that might appear at Roman nobles' banquets for their peers and political allies. Laws restricting *ambitus*, bribery specific to political campaigns, were passed. However, there was no systematic scrutiny of politicians before and after holding office. The censors, elected every 5 years for a period of 18 months, might scrutinize the moral conduct of individuals.

Since the prosecution of bribery and corruption depended on private prosecutors, accusations of bribery and corruption became a political weapon from at least the late second century BCE onward. A politician could take down, or at least inconvenience, his rival by accusing him of bribery or extortion. The famous Scipio Africanus and his brother Lucius Cornelius Scipio Asiagenes fell from political prominence in 187–184 BCE due to accusations of corruption; they may have been targeted out of jealousy and political rivalry.

In the Principate, the emperors attempted to repress bribery and corruption; in Roman ideology, a good emperor reined in his subordinates, while an incompetent or vicious emperor failed to do so. However, the inducements to extortion remained because officials in the provinces were still poorly paid; a salary structure eventually developed, but probably did not keep up with inflation in the late second and third centuries CE. In this respect, the Roman Empire resembled modern developing nations where government is relatively weak and officials are underpaid, resulting in a high incidence of bribery and extortion.

Accusations and allegations of corruption increase in later Roman sources, partly reflecting the expanded size and role of the government and the increased competition for posts in the government and army. As before, a good ruler checked the misbehavior of his officials, soldiers, and civil servants; some emperors, such as Julian (361–363) sought to a greater extent to clean house. Whether corruption in itself increased the burden on the later Roman government such that it contributed to the fall of the western Roman Empire (MacMullen 1988) is unproven.

Britain, Conquest of (43 CE)

Interaction between Rome and Britain began as early as around 100 BCE, with the southern kingdoms coming into the orbit of Roman politics and trade. Such contact suggests that at the time of conquest, much was already known about the island and travel across the English Channel. The first military contact between Rome and Britain occurred during the campaigns of Julius Caesar in 55 and 54 BCE, which may have done nothing more lasting than make the Roman public aware of Britain, but further diplomatic ramifications resulted.

In 55 BCE, Caesar brought two legions and cavalry units across the Channel, landing probably near Dover in the area of Deal in the southeast. His cavalry never joined him and his landing was delayed and frustrated by setbacks, but Caesar was eventually successful in battle, the Britons sued for peace and the Roman troops returned to the Continent. The second campaign was far larger in scale with five legions plus thousands of cavalry. The primary British opposition was led by Cassivellaunus, a British tribal leader from an unknown people north of the River Thames. These campaigns brought Roman troops just north of the Thames but no further,

where Cassivellaunus sued for peace, offering hostages to Caesar.

There was no lasting Roman military presence in Britain for a century after Caesar's campaigns, so we cannot speak of Britain as a Roman province at this time. However, these campaigns did produce important and lasting political associations and diplomatic linkages with Rome, particularly within the strong southeastern kingdoms. Minting and use of coinage in Britain increased significantly at this time, reflecting that perhaps certain kingdoms engaged in a broader dialogue of power with the rest of Britain and Rome. Augustus (Dio 53.22, 25) and Caligula (40 CE; Suetonius, *Gaius* 44, 46) are said to have contemplated or planned the conquest of Britain. These plans or attempts came to nothing and Britain lacked a Roman presence until the reign of Claudius, but the century after Caesar's initial contact certainly set the stage for the full military occupation to come.

Claudius began the full-scale conquest of Britain in 43 CE (Suetonius, *Claudius* 17). The campaign was led by Aulus Plautius and was undertaken with four legions (ca. 20,000 men) and perhaps as many noncitizen auxiliary units. The details of landing and the beginning of this campaign are still debated in scholarship. The landing is commonly thought to have occurred at Richborough in Kent in southeast Britain, focusing on gaining control of the eastern kingdom. However, there is also evidence for a landing in the southern kingdom at the Solent, perhaps where Roman forces would find a more pro-Roman group at their arrival. From either starting point, the initial goal was to reach the River Thames, secure the crossing, and capture the capital of the eastern kingdom at Colchester (Camulodunum) in the heart of Trinovantes territory. Claudius himself was present at the battle for Colchester, after which he accepted the surrender of at least 11 British kings. Those still resisting Rome were at that point rallied to form an organized opposition by the British leader Caratacus, particularly among the Silures and Ordovices in Wales. Caratacus was not captured by Roman forces until the late 40s during campaigns in Wales.

Through the 40s CE the conquest of the island was waged against tribes to the west and north, eventually penetrating into Wales. The armies at this point were broken into groups to carry out various tasks of subjugation: Legio XX remained in Colchester and the area of the Trinovantes; XIV Gemina and IX Hispana moved north and west; and II Augusta, led by the future emperor Vespasian, remained in the southwest subduing the

Durotriges and Dumnonii peoples. The primary evidence for this stage in the conquest is the archaeological evidence, pointing toward a violent end to many of the hillforts in the southern part of the island, with siege works and British cemeteries dating to the period of conquest, most famously at Maiden Castle and Hod Hill. Under command by Ostorius Scapula in 47 CE, campaigns continued into Wales against the Deceangli in the north and the Silures in the south, both particularly brutal campaigns according to Roman sources. The rebellious leader Caratacus was captured during these campaigns, having been handed to the Romans by Cartimandua, queen of the Brigantes. Events such as this and other information in the sources point to the disunity of the British people and their varied response to the conquest by Rome.

Though many groups and their leaders succumbed to Roman forces and sued for peace, several at first becoming Roman clients before complete subjugation, there was also significant resistance to Roman conquest. Caratacus led this resistance through the 40s CE, escaping Roman capture several times and spurring new groups to oppose the Roman advance. Roman troops also experienced serious setbacks, particularly in the wars with the Silures, during which an assault on a legionary vexillation resulted in the death of camp leaders and several soldiers. Rome probably experienced significant losses in these campaigns in Wales, an area that became known for its unyielding resistance and persistent raiding outside its territory through the 50s CE. Because of this characteristic, the Roman response was also exceptionally violent in dealing the final blow to Wales, particularly in the north and on the island of Anglesey (Mona) when facing the Druids and the last of the anti-Roman resistance. Wales was not fully conquered until the 70s CE when Frontinus and Agricola finally completed subjugation of northwest Wales. Elsewhere there were serious revolts, particularly in 60/61 CE, which gravely threatened the Roman occupation, taking the lives of many Romans and threatening the success of new Roman colonies and municipia (see British Revolt).

The conquest of Britain remained stagnant for much of the 60s CE, with efforts renewed only after the death of Nero. During the reign of Vespasian, who had served in Britain during the initial conquest, efforts were renewed in Britain to move the conquest of the island northward. In the early 70s CE, the general Petillius Cerialis, a man who had already seen serious fighting in Britain during the Boudiccan Revolt in 60/61 CE, accompanied legion II

Adiutrix into Britain (replacing legion XIV). Cerialis sought to bring Cartimandua and the Brigantes into the Roman Empire, ending their role as a client kingdom, to stop the ongoing aggression between peoples in the north. Conquest pushed in a northwesterly direction, with fort construction at Carlisle in ca. 72–73 CE, which may mark the establishment of a frontier across northern Britain along the Tyne River. Early military entrenchment took place at Corbridge and possibly also at Vindolanda in the center of this northern line. These early attempts to consolidate Roman interests in the north of Britain were completed by Agricola in the late 70s and 80s CE, who hoped to complete the conquest of the entire island.

Agricola and his armies (ca. 30,000 men) pushed well into Scotland and in seven campaigning seasons subjugated areas north of the highlands and probably almost to the northern limits of Scotland. A last decisive battle was fought at Mons Graupius in 83 or 84 CE in this northernmost region, though the exact location of the battle is debated. Throughout these campaigning seasons, many areas were consolidated with the construction of forts, particularly across the Forth-Clyde isthmus (roughly westward from modern Edinburgh) and in the area south down to the River Tyne. The countryside is dotted with marching camps that mark the movement of Flavian period campaigning in Scotland and a large legionary fortress at Inchtuthil was partially constructed in the early 80s on the River Tay, guarding the primary route of travel to and from the Scottish Highlands.

Abandonment of the far northern areas of Scotland occurred within a few years and the “frontier” line was created along the Tyne-Solway line (between modern Newcastle and Carlisle), defended with a series of forts today called the Stanegate. This is almost the same defended line later adopted by Hadrian in the 120s CE after he decided to consolidate the empire and end the period of conquest begun by his predecessor Trajan.

The north would see further conquest again under Antoninus Pius when Hadrian’s Wall was abandoned in ca. 142 CE and the frontier was moved northward along the Forth-Clyde line with the turf and timber Antonine Wall. This frontier lasted only ca. 20 years; after that time, Hadrian’s Wall was again used as the defensive line of the empire.

Britain, Roman

Britain was in contact with the Roman world certainly by the late second century BCE and was known to the classical world generally earlier still through trade and travel. The region that became the Roman province of Britannia came into serious contact with Rome in two expeditions by Julius Caesar in 55 and 54 BCE. Caesar describes his reasons for invading Britain as in part motivated by his desire to stop the Britons from abetting Gallic resistance to his conquest of Gaul (58–50 BCE). Caesar’s campaigns resulted only in greater contact and the full-scale conquest of the island occurred a century later in 43 CE under the emperor Claudius. During the intervening

century, the island had its own conflicts among the native peoples and their leaders.

The broad group of peoples living in Britain in the Iron Age and at the time of Roman conquest were called “Britons.” Britain comprised many separate states across a large and varied geographical area, groups which cannot be seen as homogeneous at any point. There seems to have been as many forms of authority at the time of initial interaction with Rome as there were states in Britain (at least 36 according to Ptolemy in the second century CE). Power centers were located in various areas including an “Eastern Kingdom” in the southeast that included the well-known Catuvellauni and Trinovantes, and a southern kingdom, including the Atrebates. For a time, these peoples made various treaties and agreements with Rome and became client kingdoms until the whole of the island was brought under Roman control later in the first century CE. Power was also concentrated in the religious priesthood, the Druids, who may have bolstered resistance to Rome, although little is known with certainty about them. At the time of Roman contact, power was centered in the *oppida*, large protected population centers, which emerged toward the end of the Iron Age in Britain in the first century BCE.

The conquest of the island and incorporation into the Roman Empire was completed in various stages through the second half of the first century CE. Conquest progressed from the south to the north. Some tribes were particularly difficult to bring under Roman power, such as the Silures of southern Wales. Their stalwart resistance and expert local knowledge of terrain and landscape helped them deflect Roman invasions for extended periods of time. They were finally conquered in the 70s CE by Sextus Iulius Frontinus. Conquest continued north subduing tribes in northern Wales and up toward what would become the frontier for much of the Roman period in Britain. A particularly brutal campaign was waged against the Druids. They were targeted by the Romans with particular zeal because of their mysterious practices, such as alleged human sacrifice, and extra-tribal organization, which may have allowed them an advantageous position for organizing resistance. They held out on the isle of Mona (Anglesey) off north Wales and were eliminated by the governor Suetonius Paullinus in 60 CE, with Anglesey finally taken by the governor Agricola in 77 CE. Major setbacks occurred in 60/61 CE during the so-called Boudiccan Revolt when the Icenii tribe, together with the Trinovantes, roused a large rebel army that

ravaged major Roman centers and killed thousands before the Roman legions could recover and prevail. Small revolts occurred all over the island and were quickly subdued by Roman troops.

Conquest was considered complete when Agricola led an army to the highlands of Scotland in the late 70s and early 80s CE and defeated northern peoples at the battle of Mons Graupius in 83 or 84 CE. The location of this battle is still unknown, but modern scholars have suggested various spots in northern Scotland. Quickly the Highlands became too difficult to maintain control, and the Roman army abandoned the single legionary fortress still unfinished at Inchtuthil, north of Strageath. The frontier was brought down to the line between the Tyne River and the Solway Firth with outpost forts north of the frontier.

Various emperors attempted to either extend or consolidate the province of Britain, but the lands north of Hadrian's Wall mostly remained volatile and out of reach of Roman consolidation. In the 120s CE, Hadrian made native communication and travel around the north of Britain more difficult with the construction of a wall across the country from east to west. "Hadrian's Wall" effectively created a military zone in a cordon across the country and allowed the Roman army to control activity in the north. Soon after Hadrian's death, however, Antoninus Pius abandoned the stone cordon and built a turf and timber wall along the shorter Forth-Clyde line in Scotland (west of Edinburgh). This frontier was occupied for only ca. 20 years, after which time Hadrian's Wall was reoccupied and garrisoned as the frontier line once again. Septimius Severus would again attempt control of the north in the early third century, but the campaigns were abandoned when he died at York in 211 CE.

Between 260 and 274 CE Britain was part of a separatist government known as the "Gallic Empire." This period actually brought greater stability to the western provinces but only lasted 14 years, ending when the empire was reunited again under Aurelian in 274 CE. Britain broke away again in 286–296 with the revolt of Carausius and Allectus. The general instability during the third-century crisis period had already led to opportunist raids by native peoples beyond the frontiers throughout the West. The result in Britain was a reconsolidation of the frontiers in the early fourth century and continued occupation along the wall and at northern forts throughout the fourth century. Britain was ultimately abandoned by the Roman Empire in 410 CE, its armed forces being withdrawn to fight invasions in continental

Europe. The Britons, Romanized and native, were left to fend for themselves, and Rome would offer no further assistance for their defense.

British Revolt (60/61 CE)

Among all the revolts and rebellions in Britain during the Roman period, the worst was the revolt of the Iceni in 60 or 61 CE, the so-called Boudiccan Revolt. The rebellion was sparked when the client kingdom of the Iceni, led by Prasutagus and his queen Boudicca, was incorporated into the Roman Empire in a brutal and disorganized way after the death of the king. Boudicca gathered the Iceni and was helped by the neighboring Trinovantes while the Roman governor Paullinus was busy with two legions in the conquest of northern Wales and Anglesey. The rebellious Britons first ravaged the city of Colchester and continued their march to London and St. Albans (Verulamium) before the Romans could make any serious successful counter attack. A large part of the Legio IX led by Petilius Cerialis, was slaughtered (approximately 2,000 casualties) in the initial confrontations, while the Legio II Augusta was stationed further south, out of reach. Roman forces were severely outnumbered but were nonetheless finally successful in stopping the rebellious forces somewhere in the Midlands in an area that leveled the differences in number by terrain advantageous to the Romans. Many of the cities and towns involved display strata of massive burning and

destruction in the archaeological record of this period. The numbers dead seem always to be exaggerated but the figures offered by Tacitus (*Annals* 14.37) for the decisive battle are 400 Roman soldiers dead to 80,000 Britons, which is generally agreed to be an overstatement. All told the revolt reportedly took the lives of 70,000–80,000 in the towns and cities sacked and burned by rebels, but realistically this number should probably be halved.

The reasons for the revolt seem to be many and to some extent the details are unclear. What is certain is the general mistreatment of the client kingdom, probably by lower governmental officials, during its annexation into the province after the death of Prasutagus. Tacitus reports maltreatment of the Icenii royal family in the form of rape, flogging, and land seizure by Roman soldiers and officials. The Trinovantes had apparently been infuriated by the treatment that they received from legionary veterans living in the colony at Colchester, who plundered the countryside and enslaved Britons. Generally, the process of conquest and colonization pushed the native Britons to rebellion in under 20 years of initial colonization in 43 CE. Relationships must have been strained between the various groups at stake in a newly forming province: Roman officials, local elites, the army, and the many individuals associated with military and political conquest who would change dramatically the face of the population of Britain. Almost constant pressure was exerted in Wales through the 40s and 50s CE against Roman forces and incorporation into the Roman state, and elsewhere small rebellions are given less treatment by classical authors but are hinted at in other ways. Other significant revolts did take place in Britain, most well known is the trouble arising when Trajan died and Hadrian came to power as emperor. There are still few references in classical literature about this event except for a few lines that hint at rebellion and deaths inflicted by the Britons that took a significant number of lives.

Brundisium, Treaty of (40 BCE)

The Treaty of Brundisium in October 40 BCE was an agreement between Octavian and Mark Antony to settle their differences and resume cooperation and mutual dominance over the Roman Empire. Relations between Octavian and Antony had become tense following the victories at Philippi in 42 BCE. In 41, Lucius Antonius and Fulvia (wife of Antony) had fought Octavian in the Perusine War until they were forced to surrender in February/March, 40 BCE. Antony, summoned by his brother and wife, came to Italy too late to relieve them. Fulvia met Antony in Sicily and briefed him on the situation. Joined by Domitius Ahenobarbus, formerly an admiral under Brutus and Cassius, Antony landed near Brundisium, but he was refused entry into the port (Appian, *Civil Wars* 5.56.1: because he was bringing with him an enemy—Domitius Ahenobarbus). Thereupon, Antony attacked Servilius Rullus, a lieutenant of Octavian in charge of Brundisium, and made overtures to Sextus Pompeius.

Octavian and his senior officers Salvidienus Rufus (designated consul 39 BCE) and Marcus Agrippa came to southern Italy to fight Antony. Some of their soldiers deserted, but when confronted returned to service. Nevertheless, the soldiers agreed secretly to try to reconcile Octavian and Antony, but Antony refused reconciliation, choosing to fight Octavian. The forces of Octavian then laid siege to Antony in Brundisium. The soldiers on both sides reproached one another for raising arms against their former friends. News now came that Fulvia had died in Sicily, changing dramatically the interests of both commanders.

No longer fighting for his wife's cause, Antony was susceptible to compromise. A mutual friend of both commanders, Lucius Cocceius Nerva,

along with his brother Marcus (an ancestor of the future emperor Nerva) and Antony's mother Julia, brokered a peace between the disgruntled leaders (Appian, *Civil Wars* 5.60–63). According to Dio and Appian, they agreed that Octavian should control Sardinia, Spain, Gaul, and Dalmatia; Antony would control all Roman territory in Europe and Asia across the Ionian Sea. Lepidus would retain the provinces in Africa, and since Sextus was holding Sicily, Octavian and Antony in common would wage war against Sextus Pompeius. In addition, Octavian agreed to pardon all those who had helped Lucius Antonius, including Domitius Ahenobarbus (consul 32) and Tiberius Claudius Nero (praetor 42). Finally, and most importantly, now that Fulvia had died, Antony agreed to marry the recently widowed and still pregnant Octavia, Octavian's sister, to secure the peace (Dio 48.31.3). Their marriage required a special law to be passed in the Senate to allow Octavia to remarry before her mandatory 10-month widowhood had ended.

As the greatest consequence of the Treaty of Brundisium, the Second Triumvirate was essentially renewed right at its breaking point. Sextus, unaware that Antony had betrayed him, landed in Calabria to join forces with Antony against Octavian. When he heard of the Treaty of Brundisium, he withdrew and sent his lieutenant Menas to conquer Sardinia. Finally, the Treaty of Brundisium elevated Agrippa to become Octavian's top commander by eliminating Salvidienus Rufus, who had secretly offered to betray Octavian to Antony. As a show of good faith, Antony revealed this treachery to Octavian, who at once ordered Salvidienus Rufus to be punished. Salvidienus Rufus was either prosecuted and executed, committed suicide, or was executed (Velleius 2.76.4; Appian, *Civil Wars* 5.66; Dio 48.33.1–3).

Brutus (Junius Brutus, Lucius) (ca. 509 BCE)

According to Roman tradition, Lucius Junius Brutus (consul 509 BCE) was one of the founders of the early Republic, overthrowing Tarquinius Superbus, the last king of Rome. Tarquinius Superbus' son raped Lucretia, the wife of Tarquinius Collatinus, and Lucretia committed suicide. To avenge her death Collatinus and Brutus became allies, overthrowing the monarchy and driving out the Tarquins. They held the first consulship together. However, Brutus proceeded to sever relations with Collatinus, forcing Collatinus to abdicate and go into exile as a member of the Tarquin family, suspected of plotting against the newborn Republic. Brutus is said to have put to death his sons for conspiring to restore the Tarquins. The level of intrigue may reflect the chaotic conditions of early Rome, when Rome was not yet the dominant power in Italy but a rival of other city-states in central Italy.

However, legend also accreted around Brutus as the founder of the Roman Republic, dramatized in Livy's *History of Rome*. The assassins of Julius Caesar in 44 BCE invoked the memory of Brutus as the defender of liberty. Marcus Junius Brutus was allegedly provoked to participate in the assassination by people who reminded him of his illustrious ancestry. Such ancestry was notional and political; due to Roman naming conventions and the frequency of adoptions, Marcus' direct descent from Lucius Junius Brutus over 400 years seems unlikely.

Brutus (Junius Brutus, Marcus) (ca. 85–42 BCE)

One of the most famous assassins of Caesar, Marcus Junius Brutus was the son of a man with the same name (executed by Pompey in 77 for his part in Lepidus' rebellion) and Servilia (a half-sister of Cato and later Caesar's mistress). Brutus was adopted about 59 by his uncle, Quintus Servilius Caepio, and took the name Quintus Caepio Brutus, until reverting to his birth-name some years later. He was brought up by another uncle, Cato the Younger, who trained him in Stoicism.

In the 50s, the young Brutus was hostile toward Pompey, as to be expected, but took his side when Caesar invaded Italy in 49, serving under him in Greece. Following Caesar's victory at Pharsalus in 48, Brutus was captured but pardoned by Caesar, possibly through his mother's influence. He was Caesar's appointee as governor of Cisalpine Gaul from 47 to 45, and designated urban praetor for 44, with Cassius Longinus as peregrine praetor. Both were named in advance by Caesar to be consuls for 41.

Brutus had served on Cato's staff when he governed Cyprus from 58 to 56, enriching himself by lending money at high interest. When he returned to Rome, he married Claudia, sister of Clodius Pulcher the tribune. However, after Cato's suicide in 46, he suddenly divorced Claudia and married Cato's daughter Porcia. Earlier Cassius had married Junia Tertia, a half-sister of Brutus. So there were extensive family connections between all these men.

Alarmed at Caesar being named perpetual dictator and at plans for his deification, Brutus joined Cassius and other leading senators in the plot to assassinate Caesar on the Ides of March, 44. Conscious of his descent from Lucius Junius Brutus who, according to tradition, led the expulsion of the kings from Rome, and reviving his adoptive name to show his connection with Gaius Servilius Ahala, another famous tyrannicide, Brutus was ideologically inclined to join the plot.

Popular outrage over Caesar's murder drove Brutus and Cassius from Rome and then from Italy, to take up the provinces of Asia and Syria assigned by the Senate. When Octavian seized a consulship in 43 and had the assassins declared murderers and enemies of the state, he put aside differences with Mark Antony and formed the Second Triumvirate with him and Lepidus, to confront Brutus and Cassius, who had gradually acquired control of armies and treasuries in the eastern Mediterranean and who were

heading back toward Italy. The sides fought two battles at Philippi on October 3 and 23, 42; Cassius committed suicide after losing the first, and Brutus did likewise after losing the second. He was given an honorable burial by Antony, while Porcia committed suicide too on the news of her husband's death.

Despite Stoic principles, Brutus was arrogant, greedy, and cruel in his treatment of inferiors. He was an accomplished orator, using the plain Attic style, and a writer of many works, none of which has survived. He was much admired by Cicero and others, and, though not the organizer of the plot against Caesar, he was regarded as its spiritual leader. In death, he became a symbol of resistance to tyranny, like his uncle Cato.

Bureaucracy (Roman Military)

The imperial Roman army had an extensive bureaucracy that documented and sought to control recruitment, the distribution of equipment, resources, and pay, daily orders and tasks, furlough, and discipline. Though literary sources refer to record-keeping, few documents are extant before the first century CE. Documents survive mainly from arid regions in Roman Egypt and the Near East, but also have been found in anaerobic conditions in Roman Britain near Hadrian's Wall. The army staffed specialists to maintain its records. The bureaucracy both required and trained literate personnel, who might be promoted into line management ranks, contributing to social

mobility within the Roman army. However, literate Roman military personnel also used bureaucracy to control and intimidate provincial subjects.

The Republic's consuls and quaestors (who were in charge of military finances and logistics) undoubtedly kept records of some kind. Commanders might be accompanied by writers, as Scipio Aemilianus, commander during the latter part of the Third Punic War, was by his friend the Greek historian Polybius. Commanders might be themselves talented writers, as was Julius Caesar, the author of the *Gallic Wars* and *Civil War*, or Cicero, who waged an undistinguished campaign in Cilicia. But these top-down, analytical and rhetorical viewpoints are distinct from daily documentation.

Such documentation mainly survives from arid areas of the Roman Empire, such as Roman Egypt (annexed after 30 BCE) and the Mesopotamian frontier, where many documents from Dura-Europos, a Roman base during the early third century, have been found. These documents are mainly papyri and wood tablets. In the late twentieth century, archaeologists discovered wood tablets used as a writing material preserved in anaerobic bog-like conditions outside the Roman fort of Vindolanda, near Hadrian's Wall in Roman Britain. These thin slabs of wood were written on in ink, like papyrus. Similar wood tablets have been found at Carlisle on Hadrian's Wall and at Vindonissa, a base in Roman Germany. Ostraka, pottery sherds large enough to offer a relatively flat writing surface, were also used to record more ephemeral or casual documents; many have been found at Roman bases in North Africa and Egypt. It is likely that the Roman army employed the same type and extent of documentation throughout the empire.

The army had clerks (*librarii*) and record keepers (*cornicularii*); junior staff officers (*beneficiarii*) also had administrative roles. Though they were among the *immunes*, personnel exempt from fatigues, the *librarii* and *cornicularii* did not form a cadre of noncombatant clerical workers. They gained experience of administration, and they might be promoted to tactical roles, leading eventually to the centurionate. It is likely that all personnel in the legion were expected to train for combat and to fight if necessary, though this is still controversial. *Beneficiarii*, detached to assist provincial governors, might be less likely to see combat.

New recruits were documented in an effort to ensure that they were of free birth and free status and lacked a criminal history, preventing slaves,

convicts, and deserters from enlisting. However, the Roman Empire lacked widespread proofs of identification. As the letters of Pliny the Younger to the emperor Trajan show, one role of the recruiting officers (or governor's staff) was to investigate the status of suspect recruits before they could be entered in the rosters of their units. Extant rosters show that new soldiers were identified by their name, age, any distinguishing marks such as scars, and the date on which they were enrolled. A serving soldier was also identified by his unit (legion, praetorian or urban cohort, auxiliary cavalry ala or infantry cohort, fleet) and subunit within it, such as his legionary centuria. These details were all necessary because many soldiers had the same name, and the Roman Empire had not invented unique identification numbers.

New recruits were given a stipend (*viaticum*) to fund their travel to their unit; this was drawn against their pay, as was their equipment, including arms and armor, a substantial expense that must have left many soldiers indebted to their unit. The new soldier might also find himself indebted for a tent or a horse. Records were kept of the distribution of equipment, since it was bought back by the soldier's unit when he was discharged or died during service, as surviving receipts show. Other surviving documents attest the receipt of pay (from which these stoppages for equipment, clothing, and fodder were made) or receipt of fodder for horses or money with which to buy it. These receipts show that many common soldiers, even in the *auxilia*, could at least sign their names, though they may have been "slow writers" (as the *subliterate* were termed in Roman Egypt) and needed to have the documents read aloud to them. More extensive private letters written by soldiers (or at least dictated by them to professional scribes) have also survived.

Other documents survive that show the assignment of personnel to daily and long-term duties. A so-called duty roster from Cyrenaica in Roman North Africa (modern Libya) displays the assignments of a list of personnel over a sequence of days, including routine fatigues (such as sweeping) and punishment. Longer term assignments were also recorded in surviving documents, attesting the assignment of soldiers to detached duties, usually involving the collection of supplies, which would take them away from their base for days or weeks at a time.

From Dura-Europos in the early third century, are found a series of "morning reports" (so termed by the modern specialists who discovered and

edited them). The report took a standard form, giving the formal name of the unit and listing its total strength and its subunits with their officers. Personnel departing and returning were listed. The orders of the day and the watchword were read out. The soldiers recited an oath of obedience, saying “we are ready for all orders.” Personnel who performed rites that were part of the cult of the standards were listed. These reports give a glimpse of formal routine and ceremonial in the army, an auxiliary unit in Roman Syria, in which personnel may have been assembled in the camp before their presiding officers, religious rites were performed, and the orders of the day and watchword were given.

Cumulative documentation was also employed by the Roman army, seen in the surviving *pridiana* or “strength reports” that list the total number of personnel in a unit, its officers, and changes to personnel (departures and returns, promotions, transfers, deaths, and discharges). These documents gave the Roman administration, probably at the level of a governor and his staff, concrete information about available military forces and were probably used for planning and to compile reports sent to the emperors, such as the Augustan *breviarium totius imperii*.

Documents were used to grant personnel furlough and prove their right to furlough, which were important in an empire without fast or reliable transport and communications. Though signal fires may have been used in emergencies, they were not used in routine matters. A soldier on leave had no way to contact his base faster than he himself could travel on horseback. Surviving documents from Vindolanda show that a soldier might petition his commanding officer for furlough. According to Roman ideals of discipline, a good commander granted furlough sparingly. If he received permission, he might obtain a pass that he carried with him (attested in Roman Egypt) to prove that he was not absent without leave or a deserter.

Finally, documentation in general served to maintain discipline and reduce internal conflict (the reason for an article on “bureaucracy” in *Conflict in Ancient Greece and Rome*). Documentation provided an objective record maintained over time, important in a profession in which personnel were frequently transferred and risked death or incapacitation on campaign. Documentation was a resource to which individual personnel could appeal if they were accused. For example, the soldier on furlough submitted documentation to this effect and may even have carried a permit with him. He could prove that he was not a deserter. But documentation

also promoted the physical and social control of personnel, recorded as assigned to duties or punishment. Overall, the imperial Roman army's bureaucracy was highly developed for an ancient society's and contributed to the effectiveness and continuity of the Roman army.

Burebista (Reigned 80s–44 BCE)

Burebista was a major Thracian warlord in central and eastern Europe, the most important Dacian leader before King Decebalus in the late first century CE. Burebista led the Thracian Getae from obscurity and conquered a large, multiethnic empire that extended from the Black Sea to Pannonia (eastern Austria/Hungary). The main Greco-Roman literary accounts for Burebista are Strabo 7.3.5 and 7.3.11 and Jordanes *Gothic History* 67; Ptolemy's *Geographica* 3.8.1–4 describes the region. A Greek inscription from Dionysopolis also attests Burebista's claim to be "king of kings" in the Danube region and "friend" of Pompey.

According to Strabo, Burebista unified the Dacians and Getae, fought the Celts and Illyrians, subjugated the Greek colonies of the western Black Sea littoral and raided south through Thrace into Roman Macedonia. Strabo attributes the destruction of the Celtic Boii (Bohemia) and Taurisci (Slovenia) to the king. Greek history shows archaeological evidence of destruction in this time. Burebista built citadels around Costești high in the southern Carpathians that exhibited sophisticated Greek military

architecture and secured obedience internally through the priestly class, later powerful in the Dacian kingdom, through his collaborator, Deceneus. In the Roman civil war of 49–45 BCE, Pompey courted Burebista's support through the king's envoy, Acornion of Dionysopolis. Julius Caesar's subsequent assassination in 44 BCE prevented his intended campaign against Burebista, and Burebista himself was soon overthrown.

However, after Burebista's death his empire disintegrated into smaller kingdoms, facilitating the Roman conquest of the Pannonian region in the late first century BCE and of Dacia in the early second century (annexed as a Roman province in 106 CE). After Burebista, the next king to unify the Dacian region and pose a major threat to Roman extension was Decebalus, defeated by Trajan (Roman emperor 98–117). Subsequent major kingdoms did not arise in central Europe before the period of migrations (late fourth and fifth centuries CE).

Burgundians

A Germanic people, possibly of Scandinavian origin. The first mention of the Burgundians is in the Roman geographer Pliny, who notes them with the Goths among the eastern Germanic peoples. Claudius Ptolemy, writing in the fourth century, is more specific and places the Burgundians between the modern Oder and Vistula rivers in what is now central Poland. According to Jordanes, the Burgundians were attacked and almost annihilated by the Gepids, a people living near the mouth of the Vistula.

This probably caused at least some Burgundians to migrate westward, as Burgundians appear on the east bank of the Rhine in the late third century. In 278, the emperor Probus defeated a Burgundian raiding party in eastern Gaul. The Burgundians seem to have remained on the eastern bank of the Rhine throughout the fourth century. In 406 various peoples, including the Alans, Vandals, and Suebi, crossed the Rhine and entered Roman territory. The Burgundians do not appear to have joined them. In 411, Gundahar, the king of the Burgundians, along with the Alans, supported Jovinus in the latter's bid to make himself emperor. In return for their support Jovinus settled the Burgundians along the Rhine inside Roman territory, giving them the status of *foederati*. After the death of Jovinus, their status was reaffirmed by the emperor Honorius (395–423). Despite their status as *foederati* Burgundian raids on Roman territory continued throughout the early fifth century. These raids ultimately provoked a Roman response.

In 437, the Roman warlord Aetius encouraged his Hunnic allies to attack the Burgundians, decimating the Burgundians and killing Gundahar. The defeated Burgundians surrendered to Aetius, who settled them in the region of modern Savoy under Gundahar's son Gundioc. During Gundioc's rule, Burgundian relations with the Visigoths seem to have strengthened, as indicated by the presence of Burgundian warriors, led by Gundioc and his brother Chilperic, in the Visigothic campaign against the Suebi in 455. After the death of Aetius in 454, Gundioc backed the warlord Ricimer in the latter's bid to dominate the western Roman Empire. In 472, Ricimer conspired with Gundobad, who had replaced his father Gundioc as king of the Burgundians, in killing the western Roman emperor Anthemius and appointing Olybrius as western Roman emperor. Olybrius and Ricimer died of natural causes soon thereafter, leaving Gundobad to elevate Glycerius to the throne. Glycerius, however, was soon deposed in favor of Julius Nepos. After the overthrow of Glycerius Gundobad abandoned Roman politics and focused on consolidating his power among the Burgundians.

Caecilius Metellus Macedonicus, Quintus (d. 115 BCE)

Quintus Caecilius Metellus Macedonicus was a Roman general and politician during the mid-second century BCE, famous for his victories in Macedonia. His career began in 168 BCE in the Third Macedonian War. He was sent as an envoy to Rome by the commander Lucius Aemilius Paullus to report on his success at Pydna. Following this victory, the Romans abolished the Macedonian monarchy and organized the region. The enforcement of strict conditions culminated in the uprising of a royal pretender, Andriscus, in 150 BCE. In 148 BCE, after initial negotiations failed, the Senate sent Macedonicus as praetor to wage war against him. Backed by a strong force, he successfully secured the region and captured the false king.

Macedonicus continued his military activity throughout Macedonia and Thrace as promagistrate. He was also unsuccessful in preventing the Achaean League from engaging in battle with Sparta and Rome. He defeated the Achaean forces at Scarpheia and Chaeroneia, important strongholds in central Greece. Macedonicus returned to Rome and celebrated a triumph in 146 BCE for his victory in Macedonia over Andriscus, earning the honorary name Macedonicus.

After failing on two occasions, he was elected consul in 143 BCE and allotted the province of Nearer Spain. Prior to his departure, he was enlisted to suppress a slave revolt at Minturnae, south of Rome. In Spain, he was immediately active in the Celtiberian War. His command was renewed for the following year, which allowed him to capture Contrebia and attack Numantia in central Spain.

Macedonicus died in 115 BCE and was considered to have been most

fortunate in his life. Not only did he achieve the highest political offices and military honors, but his four sons also had similar political and military success, and his daughters' noble marriages. Although an imposing and authoritative figure, he is said to have always gracefully opposed his political adversaries.

Caecilius Metellus Numidicus, Quintus (Active Late Second Century BCE)

Quintus Caecilius Metellus Numidicus was a prominent politician and military figure. He was active during the late second century BCE until his exile in 100 BCE. Numidicus is notable for his military achievements in the war against Jugurtha, ruler of Numidia.

In 110 BCE, Numidicus was elected consul for 109 and assigned the command against Jugurtha in Numidia. After retraining an undisciplined army, he achieved victories at the River Muthul and at Vaga in eastern Numidia. He then attempted to lay siege to Zama, closer to the Roman province of Africa. Gaius Marius, his legate, was instrumental in this campaign. However, Marius requested to return to Rome to stand for the consulship when Numidicus' command was renewed for another year. Numidicus denied him leave and Marius reluctantly remained at war, assisting in the recapture of Vaga, which had been betrayed to Jugurtha.

Numidicus entered into an agreement with Bomilcar, a Numidian commander close to Jugurtha, who promised the leader to the Romans in exchange for amnesty. Jugurtha learned of this treason and executed Bomilcar, causing Numidicus to prepare for immediate war. Marius was allowed to return to Rome to pursue his political career and was elected consul. The Senate had already prorogued Numidicus' command. However,

the tribunes stripped him of this and selected Marius as his replacement. In the meantime, Numidicus followed Jugurtha, capturing Thala and proceeding to Cirta, in northeastern Numidia. At this point, Jugurtha convinced King Bocchus of Mauretania to lend protection.

Numidicus learned that he had been succeeded and departed for Rome before Marius arrived. Despite the incomplete campaign, Numidicus celebrated a triumph in 106 BCE and assumed the name Numidicus.

In 102 BCE, Numidicus held the office of censor with his cousin Gaius Caecilius Metellus Caprarius. He attempted to expel the *populares* Lucius Appuleius Saturninus and Gaius Servilius Glaucia from the Senate, but his colleague disapproved. Numidicus also suffered personal attack after refusing to enroll a freedman, who was posing as the son of Tiberius Sempronius Gracchus, as an equestrian.

In 100 BCE, Saturninus, as tribune, passed an agrarian law that allotted land for the settlement of Marius' troops. It included a clause that all senators must swear an oath to uphold it. Numidicus opposed the measure and failed to swear to its provisions. Instead, he went into voluntary exile at Rhodes and a bill that officially exiled him was passed in his absence. In 98 BCE, the efforts to recall him were eventually successful, and, although he did return to Rome, he was no longer politically active.

Significantly, Numidicus was the first commander to be at war and stripped of his authority by the tribunes at Rome, against the wishes of the Senate.

Caecilius Metellus Pius, Quintus (ca. 130–ca. 63 BCE)

Quintus Caecilius Metellus Pius was a member of the powerful Metellan family which had produced numerous consuls (10 alone in the period from 119 to 60). He earned the additional name Pius (“the faithful”) for his efforts

in securing his father's recall from exile. His father, Metellus Numidicus (consul 109), had been replaced by Marius in the command against Jugurtha, and exiled by him in a dispute in 100. Consequently in Metellus Pius' time, his family sided with Sulla.

Metellus Pius held commands during the Social War (91–87 BCE), most notably defeating the Marsi, and went on to the praetorship of 89. When Sulla left for the campaign against Mithridates in the east, Metellus Pius was given proconsular command over southern Italy, but he was unable to defend it against Cinna, a supporter of Marius, and left for North Africa. Here he raised a private army of clients, eventually joining Sulla when he landed back in Italy in 83.

Metellus Pius played a role in Sulla's victory over the Marians, and was rewarded by appointment as *pontifex maximus* in 81 and consul with Sulla in 80. He was then sent to Spain to campaign against Quintus Sertorius, the last remaining Marian general. He struggled initially until joined by Pompey in 77, which led to a series of victories and an end to the war.

Metellus Pius returned to Rome in 71 to celebrate a triumph. Despite cooperation with Pompey, his politics were conservative, and he opposed the granting of extraordinary commands to Pompey and other activities of the *popularis* politicians. He died probably in the year 63, replaced as *pontifex maximus* by Caesar.

Caesar, Assassination of (44 BCE)

On March 15, 44 BCE, in Pompey's Theater in the city of Rome, the dictator Gaius Julius Caesar was murdered by a group of senators, led by Marcus Junius Brutus and Gaius Cassius Longinus, both pardoned opponents in the recent civil war, and including former supporters Decimus Junius Brutus Albinus and Gaius Trebonius.

The most obvious reason for the conspiracy was the unchallenged

dominance of Caesar. The final defeat of Pompeian forces in the Caesarian-Pompeian civil war, at Munda in March 45, meant that Caesar had no rivals left. He had been appointed dictator in late 49, a republican office that granted temporary supremacy to a single man to deal with a crisis. The dictatorship was conventionally held for a short period but in 44, following his victory at Munda in March 45, Caesar was appointed “dictator for life.” Roman political tradition was very hostile to monarchy, and there are many historical and legendary examples of assassination of would-be rulers. Caesar also held consulships simultaneously with his dictatorships, another shunned practice. Caesar also received the legal right to appoint half the magistrates each year and award command of provinces, meaning that he could reward and punish men through access to magistracies, and this added to the appearance of monarchic rule. The Roman nobility felt deprived of their traditional *libertas* (freedom) to compete for office.

From late 45 onward, many excessive honors, such as the right to use the title *imperator* permanently, usually reserved for those who had been awarded a triumph, and to wear triumphal clothing at all public events, were voted to Caesar by the Senate, some of which he accepted. It has been suggested that some were proposed by his enemies to make him unpopular. His own behavior intensified this, however. When two tribunes of the plebs, Caesetius and Marullus, attempted to punish a man who had hailed him as “King,” he stripped them of their office, a grave breach of the tribunician right to sacrosanctity. At the Lupercalia festival on February 15, Mark Antony, his fellow consul, attempted to crown him. Although he refused, it was rumored that only the negative reaction of the crowd prevented him from accepting.

Finally, Caesar intended to invade the Arsacid Persian Empire, centered on modern Iran. He planned to leave on March 18, 44 BCE on a three-year campaign. There were rumors that he intended to transfer administration to the east, and move the capital to Alexandria, due to his liaison with the Ptolemaic queen Cleopatra. All these allegations increased Caesar’s unpopularity with the Senate.

Brutus and Cassius were the central figures of the conspiracy: Brutus was allegedly descended from Lucius Junius Brutus and Gaius Servilius Ahala, both famed tyrannicides, and with Cassius had supported Pompey before his defeat at Pharsalus in summer 48. Both men had been pardoned, and were praetors in 44. Decimus Brutus and Trebonius, legates of Caesar

during the Gallic War, seemed more motivated by a lack of political opportunity within Caesar's Rome. The conspirators numbered between 23 and 35 men, expanded in later sources to approximately 60, largely senators, divided between former supporters of the dictator and his forgiven adversaries, and allegedly held numerous small-scale meetings to avoid detection.

The conspirators clearly planned the attack itself. One conspirator, Trebonius, was to keep Antony outside the theater to prevent interference. Antony himself was not to be harmed, on Marcus Brutus' instruction so that the murder would not seem like a coup. Decimus Brutus had hired gladiators to protect the group. When Caesar entered the theater, the group approached him, as if in support of a petition from Lucius Tillius Cimber. Two brothers, Publius and Gaius Servilius Casca, struck the first blows, and were followed by the whole group. Each man present sought to strike a blow; Caesar received between 23 and 35 wounds, though only one was fatal.

The assassination provoked panic among those present, who scattered, and the conspirators occupied the Capitol. Some, notably Publius Cornelius Dolabella and Marcus Tullius Cicero, offered their support, but it was clear that Antony, and Marcus Aemilius Lepidus, Caesar's *magister equitum*, held local military supremacy. On March 17, the Senate met and struck a compromise proposed by Antony and Cicero: an amnesty would be declared and all of Caesar's acts and decrees would be implemented. However, the urban populace rioted over Caesar's assassination, allegedly encouraged by Antony's speech in Caesar's honor, and besieged Brutus and Cassius on the Capitol. The conspirators were forced to flee the city. Some went to their provinces, granted by Caesar, but Marcus Brutus and Cassius held urban magistracies, requiring Antony to grant them permission to leave. The nature of the compromise made a return to a republican system of government impractical.

The assassins lacked a clear plan for the aftermath. Cicero complained that Antony should have been removed, as he appeared to assume Caesar's position. The arrival of Caesar's legal heir, Octavian, forced Antony to take a more aggressive tone. By November, the compromise had broken down, with a confused civil war beginning in northern Italy around the town of Mutina, between Antony, Octavian, and Decimus Brutus. Although Marcus Brutus and Cassius seized control of the eastern empire in early 43, the

reconciliation of Antony and Octavian resulted in the condemnation of the assassins for treason. Brutus and Cassius were defeated at the two battles of Philippi on October 3 and 23, 42 BCE and subsequently committed suicide.

The assassination of Caesar is highly important to the understanding of the period. It is firmly rooted in a period of tumultuous political change between republic and empire. Caesar was killed due to his autocracy and the appearance of monarchy, but the Roman republican system was not restored after his death. Partly, this was due to a lack of foresight by the conspirators, but this was compounded by the compromise that gave them amnesty. Caesar's acts continued to have force of law, and their beneficiaries continued to owe allegiance to his memory. Caesar's legacy was taken up by Octavian, his great-nephew and heir, who, as Augustus, would end the civil wars and inaugurate a new period, the Principate.

Caesar, Dictatorship of (49–44 BCE)

A Roman dictator was traditionally a short-term magistrate, a single chief executive replacing the joint powers of the two consuls, appointed to cope with an emergency and expected to resign his powers when the emergency had passed or after six months. Lucius Cornelius Sulla, dictator in 82–81 BCE, had done much to give "dictatorship" its tyrannical connotations, but Julius Caesar, dictator in 49–44 BCE, contributed greatly to the autocratic meaning

of the modern term.

Caesar began his course toward dictatorship by crossing the River Rubicon, the southern boundary of Cisalpine Gaul, on January 10, 49 BCE. In this action, Caesar was actually committing treason, since it was illegal for a commander to go outside the border of his province without senatorial permission, and thus he brought on a civil war. The ostensible issue for Caesar was his desire to move straight into a second consulship in 48 and thus avoid prosecution for the use of force to pass legislation during his consulship in 59. "They [his political enemies] would have it so," he remarked as he surveyed the dead at Pharsalus. "Despite all my achievements, I, Gaius Caesar, would have been condemned to death, if I had not sought the help of my army." Rivalry with Pompey was the real issue, and Caesar had found himself being maneuvered into a showdown by demands that he quit his province and disband his army, without a corresponding decrease in Pompey's legions.

Caesar gained control of Rome when Pompey retreated across the Adriatic to regroup his forces. But before confronting Pompey, Caesar undertook a lightning campaign against pro-Pompeian forces in Spain. In August 49, while still in Massilia (Marseilles) during that campaign, he was named dictator. He returned to Rome and exercised this office for just 11 days to conduct elections, and was himself elected consul for the second time for 48 (this was the point at issue in the lead-up to the civil war). He then left to conduct the campaign in Thessaly against Pompey, which ended in victory at Pharsalus.

Later that year he was named (in absence) dictator again, this time for one year, probably in October when news of his victory over Pompey reached Rome. The office would expire in September 47. Meanwhile Caesar had pursued Pompey to Egypt where he dallied with Cleopatra while coping with a blockade of his small army. He followed that up with a lightning campaign against Pharnaces, ruler of Pontus who had overrun Cappadocia and Armenia Minor. The five-day campaign in June 47 ended with a victory at Zela, summed up in the famous laconic placard, "I came, I saw, I conquered."

Though there had been little communication from him, Caesar was back in Rome by October 47. Due to civic unrest, his presence in Rome was needed, but he did not stay long. Electoral rules required a 10-year gap between offices, and it was not normal for a person to hold more than one

position at a time, but Caesar now held several positions together and without the usual gap. He was elected to a third consulship for 46, with Lepidus, and soon after was named dictator for the third time (again in absence) for 10 years. Caesar had left for Africa to campaign against the Pompeians who had gathered there under Metellus Scipio and Cato. He scored a resounding victory at Thapsus in April 46, and news of that victory had led to the renewed dictatorship. The 10-year appointment was unprecedented and highly unusual, and exercised alongside the consulship.

He was soon on the move again. Gnaeus and Sextus, Pompey's sons, had escaped from Africa and raised opposition in Spain; to deal with them Caesar left in November 46, and defeated them at Munda in March 45. Caesar was now elected to a fourth consulship, this time without a colleague; he resigned in October and replacement consuls were appointed. In 44, he became consul for the fifth time, with Mark Antony, and early in the year his dictatorship was made for life (*perpetuus*); again he held both offices together.

Despite long and frequent absences from Rome, Caesar was able to initiate an extensive legislative program, ranging from debt relief and interest reduction, colonization schemes and land grants to help the poor, to increases in the number of magistracies and senators, to reform of the calendar and codification of civil law. He undertook a large public works program that helped the economy as well as advertising himself, and planned more. He may have been more comfortable leading troops than trying to sort the state out, and at the time of his death he was planning a major campaign against the Persians, perhaps to get away.

In addition to the consulships and dictatorships, Caesar was already pontifex maximus (elected in 63); in late 47, after the victory at Pharsalus, he was given tribunician privileges, extended in 45 probably to include tribunician sacrosanctity; in 46 he was made *curator morum* ("guardian of public morals") that carried something of the authority of a censor.

There was more: he was given a string of unusual awards, privileges, honors, and titles. For example, after Thapsus, he had the right to sit in a curule chair between the two consuls; a triumphal chariot was set up in the temple of Jupiter on the Capitol with a statue of Caesar; after Munda, he was allowed to wear triumphal dress on official occasions; an ivory statue of him was carried with images of the gods in processions before games; a statue inscribed "to the unconquerable god" was set up in the temple of

Quirinus; the seventh month was renamed July in his honor; in 44 there were plans to establish a divine cult in his name. And the list went on. Mark Antony publicly offered Caesar a crown, which he rejected, but some thought he did it reluctantly and suspected him of aiming at kingship.

It is hard to know whether Caesar sought these unusual titles and honors himself, or whether flatterers proposed them to gain his favor. But this accumulation of exceptional offices and honors and Caesar's disregard for republican traditions made some aristocrats jealous—and fearful—of his overwhelming power, and they decided to remove him to preserve freedom and the Roman Republic.

Caesar, Gaius Julius (100–44 BCE)

Gaius Julius Caesar was one of the most controversial yet intriguing figures of Roman history. A charismatic general of great personal courage, Caesar was also a talented and unscrupulous politician, an orator and one of the most famous Latin authors, but he was arguably most responsible for the final destruction of the Roman Republic. Conquering all Gaul within 10

years, he proceeded to win a civil war against Gnaeus Pompeius (Pompey) and his followers. The victorious Caesar established himself as dictator. His new concept of political power led to his assassination on the Ides of March (March 15), 44 BCE. In the longer term context, Caesar is a transitional figure, paving the way for the first emperor, his great-nephew and adopted son Octavian (Augustus, 27 BCE–14 CE).

Caesar was born in Rome in 100 BCE to a patrician family that traced its ancestry to earliest Rome, but had faded from prominence in recent centuries. Because the young Caesar was allied with Cinna, Marius' supporter, through his marriage to Cinna's daughter Cornelia, Sulla ordered Caesar to divorce Cornelia. Caesar refused. The angry Sulla proscribed him, an action that deprived Caesar of his civil rights as well as his property, Caesar went into exile.

After being recalled from exile, Caesar's career resembled many ambitious young men of his class. During the late 80s and 70s BCE, Caesar served as junior staff to several promagistrates and returned to Rome upon Sulla's death in 78. Caesar prosecuted several court cases as a way to make his name. From there he spent several years studying rhetoric in Rhodes. His first elected position was to military tribune in 71 BCE. Every year, six tribunes were elected for each of the first four legions that were mustered. The military tribunate's degree of responsibility had been declining relative to the commander's *legati* (personal staff officers). Even so, the military tribunate was an important elected position for a young politician to hold.

Upon his election to quaestor for 69 BCE, Caesar entered the Senate. Before he left for Hispania Ulterior, his appointed province, he gave funerals for two women of his family: his wife Cornelia and his aunt Julia, the widow of Marius. Caesar's orations for Cornelia and Julia won him great popularity. In Julia's funeral procession, Caesar displayed the *imago*, or portrait bust, of Marius: the first time that Marius' likeness had been displayed in public since his death. Caesar thus allied himself with the memory of Marius, endorsing *popularis*-style politics and simultaneously highlighted his opposition to Sulla and his policies. The time was opportune: a number of Sulla's reforms, which in general undermined popular power, had been reversed during the consulship of Crassus and Pompey in 70 BCE, enabling open anti-Sullan statements.

Bust of Caesar. One of several differing images of the famous general, politician, and dictator Julius Caesar (100–44 BCE). This one may have derived from a cult image of Divus Iulius, as Caesar was deified after his death. Located in the National Museum and Gallery of Capodimonte, Naples, Italy. (Bridgeman Images)

Caesar held an aedileship in 65 BCE in which he further emphasized his dedication to the *popularis* cause through his staging of lavish spectacles. Aediles organized and funded state religious festivals, events that increased greatly in scale in the late republic as politicians used them to gain popular favor. Politicians in this period also funded campaign expenses, private funerals, and public entertainments. To do so, they often went deep into debt. Caesar appears to have indebted himself seriously to fund his aedileship's spectacles, including gladiatorial games with 320 pairs of fighters wearing armor decorated with silver. According to Suetonius (*Iul.* 10), in response to this spectacle, legislation was passed limiting the number of gladiators allowed in the city.

Unlike many other politicians who cultivated a *popularis* image, Caesar,

as a patrician, could not hold the tribunate of the plebs and propose legislation that would directly benefit the populace. He needed to seek the praetorship and consulship to attain more power over policy. Instead, he made a lateral move, running for the office of *pontifex maximus*, the most prestigious priesthood in the Roman state. Since this office was normally held by men of consular rank, many nobles were offended by Caesar's running for the pontificate when he had not yet even been praetor. However, Caesar won the pontificate by a landslide. His bribery, according to the ancient sources, won him the position, though some modern scholars point to Caesar's strategic display of support to ensure his popularity, particularly for the great military hero of that period, Pompey the Great.

Caesar was now in huge debt, motivating his alliance with Crassus, probably the wealthiest man at Rome. Debt may have motivated his sympathy with the Catilinarian conspirators, as Catiline had advocated general debt relief. Caesar advocated merciful treatment for the Catilinarians, but was opposed and overruled by the conservative Cato the Younger, his enemy. In 61, Crassus provided surety to Caesar's creditors, enabling Caesar to take up his propraetorial command in Spain. In Spain, Caesar had to abort his campaign and pass up the chance of a triumph-qualifying victory to run for the consulship at Rome, which he very much wanted to win. Candidates had to present themselves personally at Rome, and because promagistrates with *imperium* could not cross the boundary of Rome without laying down that power, Caesar was forced into a position of having to choose.

During this period, Caesar, Crassus, and Pompey formed an informal and at first secret alliance, the so-called First Triumvirate. However, unlike the later Second Triumvirate of Mark Antony, Lepidus, and Octavian, this agreement was not legally sanctioned. The First Triumvirs agreed that any action that each member might take could not cause harm to the other two, though otherwise each member was independent. Although Caesar had less influence than the other two, he, unlike the others, was eligible for election. Pompey and Crassus needed a strong ally in power to ensure passage of legislation favorable to them: Pompey needed to reward his soldiers from the Mithridatic Wars, and Crassus needed to provide relief to the *publicani* in Asia, who due to overbidding for tax contracts were likely to suffer substantial financial losses. The group of politicians led by Cato the Younger strongly opposed these policies.

Pompey and Crassus did, however, ensure Caesar's election to the consulship of 59. As consul, Caesar proposed a land bill that incorporated rewards for Pompey's veterans with land grants to civilians. To avoid obstruction by Cato and his supporters in the Senate, Cicero proposed this bill directly to the assembly, an unc customary action for a consul, and ignored his fellow consul Marcus Bibulus' attempts to stop him on religious grounds. The matter provided the substance for prosecution of Caesar by his enemies.

Caesar's actions for the rest of 59 included many favors for his allies, but also serious state reforms, such as wide-ranging legislation against corruption. Later, as dictator, he also displayed such a combination of cronyism and progressive reform. Caesar also took steps to ensure his proconsulship. At this time, proconsular commands were usually determined prior to the elections. Caesar's political maneuvering enabled the *lex Vatinia*, which gave him a five-year command of Transalpine Gaul (originally Illyricum) and Cisalpine Gaul. Such a command protected him from prosecution by his enemies, and also gave him the chance to win great wealth and glory.

Caesar launched the Gallic Wars with war on the Helvetii, an Alpine people, and against Ariovistus, leader of the German Suebi, whom Caesar expelled from Gaul. For these accomplishments, he received unprecedented honors from the state. In subsequent years Caesar made the first Roman expedition to Britannia. Serious setbacks ensued, such as the semi-coordinated Gallic attack on Rome's winter camps in 54–53, and the more dangerous and better organized Gallic revolt of 52 led by the Arvernian prince Vercingetorix. Caesar's victory at Alesia broke the strength of the Gallic opposition, however, and in 51–50 his armies consolidated Roman control over Gaul. The conquest of Gaul made Caesar and his supporters enormously wealthy and created an army notable for its courage, skill, and loyalty to Caesar. It also gave Caesar a military reputation that equaled Pompey's.

At the same time, Caesar attended to the duties of a governor in Cisalpine Gaul and remained in touch with politics at Rome. At Luca in 56, Caesar, Pompey, and Crassus renewed the Second Triumvirate, also renewing Caesar's appointment in Gaul, assigning Crassus to Syria and Pompey to Spain. However, Crassus perished in his Persian campaign of 53, and Pompey's loyalty to Caesar weakened after the death of Pompey's wife

Julia, Caesar's daughter. However, Caesar and Pompey did not become open rivals until the civil war began in 49.

The civil war began because of political conflict. Caesar sought a second consulship (running in absentia) and his enemies wanted to remove him from his governorship. Caesar's allies, tribunes of the plebs, vetoed unfavorable motions from the Senate. Caesar also won support through extensive bribery. Despite the rising tension, much of the Senate was reluctant to resort to civil war against Caesar. In late 50, matters escalated: the tribune Curio proposed that Pompey and Caesar both give up their armies, a motion that passed by an overwhelming Senatorial majority. However, it was blocked by the anti-Caesarians. By early January 49, the tribunes Mark Antony and another Caesarian, Quintus Cassius, fled Rome after threats to their safety, joining Caesar close to the border of Cisalpine Gaul, where he awaited with three legions. When Caesar was declared a public enemy at Rome, he decided to cross the Rubicon into Italy, beginning the civil war (January 10, 49 BCE).

Caesar advanced quickly through northern Italy, securing the loyalty of the inhabitants of this region. He marched through Picenum and Samnium to prevent Pompey and Domitius Ahenobarbus from recruiting troops in their respective home territories. The Pompeians depended on new recruits, no match for Caesar's veteran legions. Accordingly, the Pompeians withdrew south of Rome and, after Domitius surrendered to Caesar at Corfinium, crossed the Adriatic to the east, hoping to recruit manpower there.

Caesar first waged a short campaign against the Pompeians in Spain, where Pompey had stationed several veteran legions. Caesar forced the Pompeians to surrender at Ilerda and disbanded their legions, thus depriving Pompey of manpower. He then followed the Pompeians eastward. Though Caesar was outmaneuvered and besieged by the Pompeians at Dyrrhachium, the decisive battle took place at Pharsalus (August 48), where Caesar's experienced troops routed the much larger Pompeian army. Pompey survived and withdrew to reorganize forces, but was assassinated on his arrival in Egypt by order of the Ptolemaic king, who was hoping to win favor with Caesar. Caesar followed him to Egypt and became embroiled in dynastic politics at Alexandria, putting Cleopatra VII on the throne as ruling queen.

Though the victory at Pharsalus was decisive, the remaining Pompeians

did not give up easily. Caesar followed them to North Africa, defeating them at Thapsus, and to Spain, where he inflicted a final defeat on the Pompeians in the battle of Munda (March 45). Between phases of the war, Caesar spent at least short periods in Rome, acting as either dictator or consul. As dictator, he increased the number of magistracies available and enlarged the Senate, both to improve governance and also to reward his supporters, integrating more Italians into Roman government. He established many veteran colonies, mostly outside Italy, and paid his soldiers in land and cash bonuses.

Caesar's plans for his own future at Rome are difficult to discern, overshadowed by his assassination. From 49 until his death, he repeatedly held the consulship, also holding the dictatorship at least four separate times, the last with an undefined term (*dictator perpetuus*). He slated candidates for office for many years ahead who were invariably elected, leaving very little room, his opponents perceived, for meaningful opposition. Yet while he had strong allies, notably Mark Antony, he had no clear successor. Whether he planned to rule as an autocrat is unclear. When Mark Antony offered him a crown at the Lupercalia of February 44, Caesar refused it. But during the months before his death, he was voted numerous unprecedented honors by the Senate, including the already mentioned dictatorship for life, in addition to an uninterrupted consulship, and the naming of a month of the year after him, as well as honors typically only given to the gods. Were these honors originally suggested by Caesar, or was the Senate testing the situation by seeing how far he would go?

Caesar's dictatorship created enormous resentment within the aristocracy. His outsized influence made it impossible to conduct a political career on traditional terms, destroying the "freedom" (*libertas*) of the traditional nobility to compete for office. Caesar's policy of *clementia*, "mercy," sparing many of the Pompeians, only preserved the lives of his enemies. Two former Pompeians, Brutus and Cassius, and some of Caesar's former supporters formed the conspiracy against him.

The time and place set for the attempt was the Senate meeting of March 15, the Ides, and was likely not decided upon far in advance. Caesar planned to set out on a Roman campaign against Persia in only a few days; the time to act was now. Soon after Caesar entered the location set for the meeting, Pompey's Theater, he was surrounded by senators asking him for favors, part of the plot. As they tugged on his toga, he attempted to pull away, and

the attack began. He was stabbed numerous times, and left to die at the foot of Pompey's statue.

The assassination solved nothing. Brutus and Cassius, the so-called Liberators, were surprised by the popular outrage at Caesar's death and had to leave Rome for their safety. The assassination also solved none of the recent problems of Roman Republican government, that is, the alienation of the ruling class from the general population, the failure of the Roman state to accommodate its much larger territory and population, and the factionalism within the ruling class that delayed or distorted meaningful attempts to reform.

Civil war began anew. Caesar's great-nephew and heir, Gaius Julius Caesar Octavianus (Octavian), later the first emperor Augustus, called on Caesar's loyal veterans and exploited Caesar's name and wealth in his own rise to power. Octavian allied first with Antony to defeat the "Liberators" and then progressed to civil war with Antony, finally becoming the sole ruler of the Roman world.

Caesar has been made an exemplum for blind arrogance and ambition, seen as representative for the consequences of imperialism, as well as set up as a model statesman and commander. His writings have been studied for their clarity and incisive intelligence, while several of his innovations, notably his calendar reform, have survived to this day. Without doubt, Caesar, however he is understood, will remain as a figure inspiring debate in Western culture and thought.

Calgacus (Active 80s CE)

Calgacus (or Galgacus) was a Caledonian leader who fought at the battle of Mons Graupius in 83 or 84 CE. He appears in Tacitus' *Agricola*, a biographical work that the historian wrote about his father-in-law, Gnaeus Julius Agricola, a general under the Flavian emperors and the governor of Britain, where he campaigned for seven years. Calgacus' name occurs only once in the *Agricola* where Tacitus calls him a leader "most distinguished by birth and valor" (Tacitus, *Agricola* 29.5). He orates to the assembled tribes in advance of the battle, emphasizing that the Caledonians are fighting at the ends of Britain with nothing but sea behind them and Romans in front. The Romans he calls "robbers of the earth," vain and greedy, and included is the famous line, "they [the Romans] make a desert and call it peace." He reminds the tribes of their probable fate, and advocates death in preference to slavery. There is some question about the veracity of Tacitus' inclusion of Calgacus as a historical personage and even more question about his speech, which, delivered to a Roman enemy in a foreign tongue, was unlikely to have been known to the Romans. The speech is almost certainly a Tacitean invention. It may present the author's own criticisms of imperial policy and Roman greed, or it may simply be a rhetorical exercise in presenting the enemy's viewpoint without endorsing it. In the ensuing battle, the Caledonian tribes suffered a heavy loss. The name of Calgacus never occurs again, and his ultimate fate is unknown.

Caligula (Emperor) (37–41 CE)

Gaius Julius Caesar Germanicus, better known as Gaius (Caligula), emperor from 37 to 41 CE, was born in 12 CE in the city of Antium. Gaius was the third son of Germanicus and Agrippina the Elder. Germanicus was the nephew of the emperor Tiberius (14–37 CE), a successful general and a potential successor of Augustus and Tiberius. Gaius earned the nickname *Caligula*, “little boots,” because he wore the costume of a Roman soldier when he accompanied his father and mother to the Rhine frontier where Germanicus suppressed the mutiny of 14 CE.

After his father Germanicus died in 19 CE, Gaius lived in Rome with his mother. When Gaius was 18 years old, Tiberius’ praetorian prefect Lucius Aelius Sejanus convinced Tiberius to eliminate his mother and two elder brothers. Tiberius turned over much of the government to Sejanus and retreated to the island of Capri. In 29 CE, Gaius was called to join Tiberius on Capri, where he was adopted by the emperor. Although Gaius had not received a proper education in oratory and public affairs, he continued to gain authority, holding the consulship four times.

In 37 CE Tiberius died and Gaius, with the help of the praetorian prefect Macro, was declared emperor. Gaius’ accession was generally accepted with joy and relief by both the Senate and the people, for the paranoid and much-feared Tiberius had become very unpopular.

In 39 CE Gaius, following in the footsteps of his father Germanicus, headed north to prove his worth as a commander and possibly conquer Britain. Although he took four legions with him, Gaius only reached the coast of the English Channel, where he made his soldiers collect seashells as trophies of victory over the Ocean (Suetonius, *Gaius* 46). Modern scholars have questioned whether a rational policy underlay this anecdote. However, Gaius expanded the empire by adding the client kingdom of Mauretania. In 40 CE, Gaius had the Mauretanian client king executed and made preparations for the incorporation of Mauretania as two Roman provinces.

One of Gaius’ biggest failures was his handling of the Jewish people and their relationship with Rome. There were several severe riots in the Jewish community of Alexandria. Second, the Jews had destroyed an altar honoring the emperor as divine. To punish them, Gaius ordered a statue of himself dressed as Jupiter to be placed inside the Temple of Jerusalem. Herod Agrippa, one of the Jewish leaders and friend to Gaius, finally

persuaded him to cancel the command. Gaius and his mishandling of the Jewish community and its relationship with Rome promoted Jewish hostility toward Rome, leading to a full-scale revolt in 66–70 CE, crushed brutally by the Romans.

From 39 CE until his death, Gaius' relationship with the Senate deteriorated. Breaking an old promise, Gaius reopened Tiberius' records of trials and ordered new investigations of senators for suspected treason. He replaced consuls, forced them to run alongside his chariot, executed many senators for conspiracy, and even threatened to have his horse made consul. His two surviving sisters, Julia Livia and Agrippina the Younger (the subsequent mother of Nero), were banished due to their involvement in conspiracy against him.

In early 41 CE, members of the Praetorian Guard, senators, and several freedmen assassinated Gaius, his wife, and his daughter as Gaius walked through his secluded palace corridors. Gaius had ruled Rome for three years and 10 months and was arguably one of Rome's least successful emperors, generating his reputation as a "monster" (Suetonius, *Gaius* 22) with many lurid anecdotes. Some scholars have attempted to rehabilitate him.

Camillus (Furius Camillus, Marcus) (Active Early Fourth Century BCE)

Camillus (Marcus Furius Camillus) was a general and politician of the early republic during the Etruscan Wars in the early fourth century BCE. According to the Fasti, he was a military tribune with consular power

(similar to the consulship) six times between 401 and 381. He held the dictatorship five times (396, 390, 389, 368, and 367) and the censorship once (403). He defeated the Etruscan cities of Veii in 396 and Falerii in 394. The main sources are Livy, Diodorus Siculus, and Plutarch's *Life of Camillus*, with dramatic and legendary content due to the remote period.

Camillus' very distinguished career paralleled later generals such as Scipio Africanus and Marius, so that legends about Camillus may reflect the concerns of a later time, when politicians' monopoly of power was associated with the downfall of the republic. This plot arc is clearly apparent in Livy and in Plutarch's *Camillus*. Camillus was said to have become arrogant due to his victories and offices, holding a triumph in which his chariot was pulled by white horses, sacred to Jupiter (Livy 5.23.5). He was tried and exiled in 391, but was permitted to return because the Roman state needed him: according to legend, he drove the Gauls off from the sack of Rome in 390.

Camillus Scribonianus (ca. 5 BCE–42 CE)

Lucius Arruntius Camillus Scribonianus was a Roman statesman, general, and usurper, who held the consulship in 32 CE. His biological father Marcus Furius Camillus (consul in 8 CE), a descendent of one of Rome's oldest noble republican families, commanded a victorious campaign in Africa against Tacfarinas, for which he won triumphal insignia. Camillus Scribonianus' mother was the maternal first cousin of the future emperor Claudius, so the Camilli were already closely tied to the equally illustrious Claudii. Camillus Scribonianus' sister was betrothed to the future emperor Claudius, but died young. Lucius Arruntius (consul in 6 CE), a top courtier in the courts of Augustus and Tiberius, adopted Camillus Scribonianus.

Camillus Scribonianus held the consulship of 32 CE with Gnaeus

Domitius Ahenobarbus (father of the future emperor Nero), and subsequently commanded the legions in Germany, a crucial post for the security of the empire. Upon the assassination of Caligula in CE January 41, the Roman Senate discussed the qualifications of several potential imperial candidates, including the future emperor Galba and perhaps Camillus Scribonianus. However, the Praetorian Guard forced the Senate to choose Claudius, who had a clear dynastic claim. Shortly after obtaining the empire, Claudius executed on flimsy charges his own father-in-law, Gaius Appius Junius Silanus. The execution of Silanus frightened many aristocrats, for it suggested that no one was safe, and that Claudius was as capricious as Caligula. Thereupon, Annius Vinicianus encouraged Camillus Scribonianus, now the legate of Dalmatia, to rebel (Dio 60.15.2–3).

Camillus Scribonianus induced the legions VII and XI to revolt and sent a letter to Claudius demanding that he resign from power (Suetonius, *Claudius* 13.2). Claudius was so concerned that he summoned a council of his advisers to discuss whether or not to resign. Contemporary sources called the rebellion a civil war. However, within days the soldiers turned against Camillus Scribonianus, allegedly due to a bad omen. Camillus Scribonianus fled to the island of Issa, where he either committed suicide or was killed by his soldiers. Surprisingly, Claudius spared his son. Other conspirators, including Caecina Paetus (suffect consul 37 CE), were forced to commit suicide or executed.

Campania

This region of southern Italy, between the River Liris (Liri) and the Sele, centers upon the Bay of Naples on the Tyrrhenian Sea. The most notable Campanian cities in Roman antiquity were Capua, Cumae (the site of a famous prophetess), and Neapolis (modern Naples). Misenum, also on the

Bay of Naples, was the base of a Roman naval fleet. Inadvertently, the towns of Pompeii and Herculaneum became famous when they were buried by the eruption of Mount Vesuvius in 79 CE, preserving the daily life of these towns for future archaeologists. Before the eruption, Mount Vesuvius and the surrounding area provided rich volcanic soil for agriculture, and in consequence the Bay of Naples, settled by Greeks who founded Neapolis, became a wealthy area popular with well-to-do Romans.

Campania, however, had a more conflicted past due to its border with Samnium, a poorer and more warlike region of Italy. Campania was first settled by Etruscans and Greeks as well as native Oscan speakers. The Campanians, then a coalition of Oscan speakers centered on the city of Capua, formed an alliance with Rome in 343 BCE to ward off the highland Samnites. The first Roman highway, the Via Appia, linked Rome and Capua in 312, and the Campanians were incorporated as citizens without the vote (*cives sine suffragio*) in 290. Capua had been given the status of *civitas sine suffragio* as early as 338. Many Latin colonies were also founded in Campania with the intention of holding the Samnites in check. The Samnite Wars were over by 290, and Rome thence controlled Campania.

In 214, Capua and other Campanian communities revolted following the massive Roman defeat at the battle of Cannae (216) and sided with Hannibal, convinced that Rome was destined for defeat and perhaps dissatisfied with their status as junior partners. Rome captured Capua in 211, abolishing the city's political institutions and confiscating large tracts of Campanian land; Campanian citizenship rights were restored in 188.

Campus Martius

The Campus Martius was a plain on the east bank of the Tiber, outside the ritual boundary of Rome, that was employed for mustering troops and military training. It was also a location for rites associated with warfare.

Dedicated to Mars as early as the regal period, the Campus Martius plain stretched along the eastern bank of the Tiber. It was located outside the *pomerium*, the ritual boundary of Rome that could not be crossed by armed soldiers, until the Aurelian Wall extended the *pomerium* in the 270s CE. This location outside the *pomerium* made the Campus Martius a major zone of military activity. In the republic, Roman troops used the flat grassland of the Campus Martius for military training. In time, the Campus Martius was adorned with trophies from Rome's conquests. Macedonian ships were exhibited on the Campus Martius, along with the Column of Marcus Aurelius commemorating the Marcomannic War.

The Campus Martius also had religious significance. It served as a location for religious ceremonies related to war. The opening of the war season was marked by animal sacrifices, such as the *suovetaurilia*, performed in the Campus Martius. The closing of the war season was marked by the October Horse ceremony, also performed in the Campus. The triumphal procession started from the Campus Martius. Throughout the republic, military victories brought the construction of temples to foreign deities in the Campus Martius.

Executions, including crucifixion, took place on the Campus Martius. During one October Horse celebration on the Campus Martius, Julius Caesar ordered the priest of Mars to ritually execute two soldiers for military insubordination. Despite the presence of armed soldiers and executions, the field only once received a stigma of religious pollution, resulting from the improper execution of Manlius Capitolinus in 384 BCE.

Additionally, male citizens assembled on the Campus Martius to hold the *dilectus*, the *comitia centuriata*, and the census. Augustus reorganized the area of the Campus Martius, dividing the open land from building zones.

Cannae, Battle of (216 BCE)

The battle of Cannae was one of the most important battles of the Second Punic War, fought on August 2, 216 BCE, in which Hannibal and the Carthaginians inflicted a major defeat on the Romans, who were commanded by Lucius Aemilius Paullus and Gaius Terentius Varro. It took place on the plain between the ruined citadel of Cannae and the River Aufidus, some 200 miles to the southeast of Rome. Hannibal had been moving his army south since entering Italy in November 218, and had already inflicted two significant defeats on Roman forces, at the River Trebia in northern Italy in 218, and then, crossing the Apennines, on the shores of Lake Trasimene the following year. In 217, the Roman dictator Fabius Maximus had instituted a strategy of refusing battle, hoping to deplete Hannibal's forces through small-scale skirmishing and to force him into a war of attrition on foreign soil. Making a loop through the Italian peninsula via Beneventum and Capua, Hannibal evaded Fabius and wintered in Gerunium. In June 216, he headed his army south to Cannae, a Roman food magazine, with the intent of provoking the Romans to a pitched battle.

The two Roman armies of the previous year were still in the field, under the consuls of 217, Gnaeus Servilius Geminus and Marcus Atilius Regulus. The latter had replaced the consul Gaius Flaminius, who had been killed at the battle of Lake Trasimene. These men were voted proconsular powers by the Senate, while Lucius Aemilius Paullus and Gaius Terentius Varro were elected consuls for 216. The Romans therefore brought their largest force to date into the battle: eight Roman legions matched by eight allied legions, with contingents of cavalry attached to each. This amounts to some 87,000 men, a figure given by Polybius, and Appian, Livy, and Plutarch all give similar figures. The Romans drew up their forces at sunrise, with Paullus in command of the Roman cavalry on the right wing, and Varro in command of the allied cavalry on the left. The plan seemed to be to contain the movements of the dangerous Carthaginian cavalry units, similarly

occupying the right and left wings, especially on Paullus' side where the proximity to the River Aufidus restricted the field of battle. This, the Romans supposed, would allow the Roman center of infantrymen to exploit their numerical superiority and push through the Carthaginian lines. It seems, however, that Hannibal anticipated the stratagem, and he stationed all his heavy Spanish and Celtic cavalry opposite Paullus, under the command of Hasdrubal, one of his generals. Its crucial order must have been to break through the Roman lines before the center collapsed. In the center, Hannibal placed his infantry in a convex line to slow the Roman advance. In front, he stationed Balearic slingers and spearmen. On his right, he placed Maharbal in charge of the light infantry.

When battle was joined, combat was bitterest on the Roman right wing, where both sides knew victory was vital. Trapped between the river and the infantry, the cavalry units grappled man to man, with no room for maneuver. Aemilius Paullus was wounded at the beginning of the battle by a stone from one of Hannibal's Balearic slingers, and the superior numbers of the Celtic and Spanish cavalry forced the Romans to turn and flee, an escape hindered by the fact that many of them had dismounted with their wounded commander. With a gap opening up in the right wing, Hasdrubal was able to lead the cavalry through, galloping behind the Roman lines to fall upon Varro's cavalry contingent on the Roman left wing. These too turned and fled. In the center of the lines, the Romans had pushed back the enemy infantry but had been drawn into the curve, with the middle of the line in advance of the fighting at the sides. This compressed the Roman legions closer together and restricted their fighting space, but the real danger was that the legions had passed two uncommitted contingents of African heavy infantry which Hannibal had stationed on the wings. Now he ordered them to attack the rear of the Roman lines, completely encircling the infantry and precipitating a massacre. Livy's numbers are more convincing than those of Polybius, which contradict themselves. He records 45,500 infantry and 2,700 cavalry were killed, while 19,300 men were captured and 14,550 escaped. Hannibal's losses are recorded by Polybius at 5,700 and by Livy at 8,000. Aemilius Paullus was killed, according to Livy, waving away a soldier who tried to rescue him from the battlefield with the words, "let me die here with my slaughtered troops." Also on the casualty lists were the proconsul Geminus, the former Master of the Horse Marcus Minucius, and some 29 military tribunes and 80 men of senatorial rank.

At Rome the populace believed that Hannibal would appear at the gates at any moment, and his decision not to march on Rome was later debated by Roman schoolboys as an exercise in rhetoric. The specter of Cannae haunted the Roman consciousness as an icon of catastrophic defeat. The ancient accounts tend to place responsibility for this defeat on the consul Varro, who was in overall command on that day. They simultaneously show Paullus as favoring a policy of declining pitched battle, such as that championed by Fabius Maximus the year before, and portray him as pressured into battle by Varro and his over-excited soldiers. This, however, is extremely unlikely, as Varro survived and was entrusted by the Senate to further commands. The blaming of Varro is now thought to be the product of anti-plebeian bias and a propaganda campaign on the part of the powerful family of the Aemilii. The Lucius Aemilius Paullus who commanded Rome's victory in the Third Macedonian War was Polybius' patron, so Polybius had a motive to flatter Paullus' ancestors. But Polybius had a larger motive. For Polybius, the battle of Cannae was the lowest moment of Rome's fortunes, but also her turning point. Polybius' expressed purpose was to explain how, having been brought so near to absolute destruction, Rome recovered and rose as a great Mediterranean power.

The *capite censi* were Rome's poorest citizens during the republic, who had no real property to declare in the census other than their own selves (*caput, capitis* literally means "head," but also meant one's life or personhood). *Capite censi* were looked down on as untrustworthy, having no stake or contribution to the community as a whole (e.g., Sallust, *Jugurthine War* 86). They were practically disenfranchised in the voting assembly that elected upper magistrates, and populist leaders who reached out to them were often feared by *optimates* as would-be demagogues. During the early and middle republic this landless, increasingly urban group was deemed unfit for military service, but this stricture was relaxed amid the *popularis* politics and real military crises of the late second century BCE. Gaius Marius took the decisive step of recruiting the *capite censi* into the legions, creating armies that depended on military service for their pay and benefits. Over the course of the next century, Rome's urban poor played a major role in the political disorder that brought down the Roman Republic.

In this encyclopedia the term *capite censi* is used preferable to *proletarii* (its synonym) because the translation "proletarian" is anachronistic.

Caracalla (Emperor) (211–217 CE)

A Roman emperor (joint 198–211 CE, alone 211–217), born Septimius Bassianus in 188 CE, Caracalla was the eldest son of the African senator Septimius Severus and his Syrian wife Julia Domna. He took the imperial name Marcus Aurelius Antoninus when elevated to the rank of Caesar by his father in 195 CE; promotion to the rank of Augustus followed in 198 CE. The new name was designed to link the Severan dynasty with the Antonines, as Septimius claimed to be a son of Marcus Aurelius. The

nickname Caracalla was given to him as a result of his fondness for wearing a hooded Gallic cloak called the *caracallus*. In 202 CE, Caracalla married Plautilla, the daughter of Septimius Severus' powerful praetorian prefect Gaius Fulvius Plautianus.

Caracalla was groomed as the heir apparent of Severus and received preferential treatment to his younger brother Geta. Caracalla was depicted as noticeably older on coins, even though Geta was only a year his junior. The two brothers disliked each other enormously, which led to a hostile atmosphere at court, much to the despair of their mother Julia Domna. In 205 CE, Caracalla engineered the downfall of Plautianus, alleging that he had conspired against Severus: Plautianus was murdered, and Plautilla exiled. When Septimius Severus embarked on a campaign in Britain in 208 CE, he took both Caracalla and Geta with him in attempt to resolve their enmity. He died of gout at York in 211 CE, and his sons assumed his place as joint emperors. They returned to Rome, and Caracalla had Geta and his associates murdered before the year was out in a bloody coup. Geta's name was effaced from inscriptions and his portraits destroyed throughout the empire.

Bust of Caracalla (Marcus Aurelius Antoninus, 211–217 CE), ca. 212. The portrait's tough expression may represent a more "military" style of leadership, which, however, failed to prevent Caracalla's assassination by his soldiers. Located in the Ny Carlsberg Glyptotek, Copenhagen, Denmark. (Prisma/UIG via Getty Images)

As sole emperor, Caracalla doubled the pay of the soldiers, with whom he identified strongly, styling himself their *commilito* ("comrade"). His administrative measures included the introduction of a new coin denomination, the *antoninianus*, and the so-called *Constitutio Antoniniana*, which granted Roman citizenship to all free inhabitants of the empire. According to the historian Cassius Dio, who is generally very hostile to the emperor, this was an attempt to increase proceeds from taxation to pay the army.

Caracalla spent most of his reign outside Rome. He embarked on

campaigns against the Alamanni in 213 CE and the Carpi in 214 CE before traveling through Asia Minor to the eastern provinces. His intention was to launch an expedition against Persia in emulation of his idol, Alexander the Great. Caracalla journeyed to Alexandria to pay homage to Alexander in 215 CE, but the visit ended in a riot and the massacre of many inhabitants of the city. Plans for a new campaign were aided by the fact that Persia was divided by civil war. When one of the candidates for the Persian throne, Artabanus, refused to marry his daughter to Caracalla, the emperor resolved to seek revenge by invading their territory. The war was as yet unfinished when Caracalla was murdered by one of his soldiers in April 217, as part of a plot orchestrated by the praetorian prefect, Marcus Opellius Macrinus.

Carausius (Usurper) (286–293 CE)

A Roman officer and later emperor in Britain (r. 286–293 CE), Marcus Aurelius Mausaeus Carausius was born in Menapia (in northern Gaul) and began his career as a helmsman. Carausius entered the Roman army and served under the emperor Maximian (286–305), then Caesar, in his campaigns against the Bagaudae in Gaul in 285 CE. In the following year, Carausius was appointed commander of the English Channel fleet, with a special remit to hunt down Saxon pirates and seize their plunder. Maximian accused Carausius of taking the plunder for himself and ordered his execution. In response, Carausius revolted as emperor in Britain as well as parts of northern Gaul. Carausius' revolt seems to have motivated Diocletian to promote Maximian to co-Augustus (286).

Carausius minted coins proclaiming his reign as a new golden age for the Roman Empire. He also sought legitimacy by portraying himself (without their permission) as an associate of the emperors Diocletian (284–305) and Maximian: one of his coins depicted all three rulers with the legend “Carausius and his brothers.” However, Carausius was not recognized as emperor. Diocletian and Maximian did not feel any fraternal loyalty toward Carausius, and tried to unseat him unsuccessfully for several years. A naval campaign launched against Britain in 290 CE ended in disaster when the fleet was destroyed by a storm.

In 293 CE, Maximian’s deputy, the Caesar Constantius, successfully captured Carausius’ stronghold of Boulogne in northern Gaul. Soon afterward Carausius was murdered by Allectus, probably his praetorian prefect. Constantius launched an invasion of Britain in 296 CE in which he defeated and killed Allectus and reincorporated the island into the Roman Empire.

Main sources for the career of Carausius are the *Panegyrici Latini*, which include contemporary orations praising Maximian that relate the events in Britain, and the epitomators, who summarize the history of the Tetrarchy.

Carinus (Emperor) (283–285 CE)

A Roman emperor (283–285 CE), Carinus ruled with his brother Numerian following the death of their father Carus in 283 CE. Carinus campaigned against the Quadi in Germany, and possibly also in Britain. When Numerian was found dead in 284 CE, the imperial power was claimed by Diocletian, commander of the imperial bodyguard. Carinus suppressed a

revolt staged by his praetorian prefect, Iulianus, and then marched to Moesia to face Diocletian in battle in mid-285 CE. Carinus was victorious in the ensuing confrontation at the River Margus, but was killed immediately afterward by one of his soldiers, allegedly because he had slept with the man's wife, enabling his officers and army to go over to Diocletian.

In his civil war with Carinus, Diocletian probably emphasized Carinus' immorality; the *Historia Augusta's* unreliable Life of Carus, Carinus, and Numerian emphasizes Carinus' bad character.

Carrhae, Battle of (53 BCE)

Carrhae (June 9, 53 BCE) was one of Rome's most notorious military defeats, alongside the battles of Cannae (216 BCE), Arausio (105 BCE), the Varian disaster (9 CE), and Adrianople (378 CE).

Marcus Licinius Crassus was over 60 when he undertook the campaign against the Persians. His military experience was limited, going back to the 80s and against Spartacus in 72–71, but he may have wanted a victory to equal those of Pompey and Caesar: only a victory over a major enemy would bring the necessary prestige. In hindsight, Crassus' ambition is depicted (e.g., by Plutarch's *Crassus*) as overreaching and motivated by greed.

Crassus secured a command in Syria to follow his second consulship in 55. It is not clear whether his *provincia* included the right to make war on the Persians. The size of his army—seven legions (probably) and about 4000 cavalry—would suggest it did. There was also instability on Rome's eastern frontier, which the Romans may have wanted to deal with.

Crassus arrived in the spring of 54. He crossed the Euphrates and spent time reconnoitering and establishing garrisons, especially along the river Belikh. He returned to winter in Syria to train his troops and to organize his supply lines by extorting large sums of money and plundering temples (taken as a sign of his greed). In the following spring, Crassus crossed the Euphrates again and traveled along the river. Support promised by the Armenian king Artavasdes failed to materialize, as he had been diverted by a Persian attack. The claim of Abgar (or Ariamnes), an Arab chieftain and guide, that tracks heading southeast from the Euphrates indicated a retreating Persian force, induced Crassus to head away from the Euphrates toward the garrisons along the Belikh.

After a desert crossing, Crassus did not rest his troops but pressed on, not wanting the supposedly retreating Persians to escape. At this point Abgar deserted, but Crassus kept going. The enemy was led by the Surenas, who devised tactics suited to his troops—heavy-armed cavalry and a camel-train to keep his archers supplied with arrows. The forces met near Carrhae on June 9, 53. Hemmed in by the heavy cavalry, the Romans fell to the continuous hail of arrows. Crassus' son Publius, who had brought 1,000 horsemen from Caesar, led a rash cavalry action away from the main battle and was killed.

The Romans headed for Carrhae, but staying there was untenable, so they moved north toward Sinnaca, another garrison. Near there, the Surenas offered a parley to which Crassus reluctantly agreed, but he was taken prisoner and killed.

Despite heavy casualties a number escaped: some to Syria which they capably defended, while around 10,000 prisoners became mercenaries in the Persian army. Some of these gradually worked their way east, one group even ending up settling in western China. The standards lost by Crassus' army were eventually recovered during the principate of Augustus in 20 BCE.

Losers usually receive a bad press: Crassus was no exception. His loss is credited to his greed, but he did actually make adequate military preparations. Nor did he lead his army through a trackless and waterless desert: he had reconnoitred the area the year before, and the snow melt meant that rivers would have had water. Where he can be blamed is his reliance on untrustworthy guides and his failure to learn enough about the tactics and resources of a better opponent.

Carthage (State)

Carthage was founded in 814 BCE as a colony. The inhabitants of the colony came from the city-state of Tyre in Lebanon and were Phoenicians in both language and material culture. In various mythological stories related to early Carthaginian history, the city-state appears to be ruled by a monarchy. However, the existence of this monarchy and its duration from the ninth to sixth centuries BCE cannot be established with any degree of historical accuracy. Rather, the Carthaginian state and its organization is only well documented for its imperial period, which lasted from the sixth to the second centuries BCE. During this period, power in the Carthaginian state was distributed between three offices: the Shofet (Judge), the Rab (General), and the Rab Kohanim (Chief Priest).

The term Shofet denotes a “judge.” At Carthage, however, the office included more responsibilities than judicial affairs. The Shofets served as the head of civil administration for the city-state itself. Thus the Shofet was the most powerful official who permanently resided in Carthage for his term of office. Two Shofets were appointed annually at Carthage. The Shofets (*suffetes* in Latin) were eponymous magistrates: their names were applied to the year in which they served, in the same manner that the Romans denoted years by the names of the consuls who held office. Carthaginian inscriptions attest that certain Carthaginian families were able to earn the position of Shofet for multiple generations. It is not uncommon to encounter a Shofet, whose father, grandfather, and great-grandfather had also served as Shofet.

Every year, the Carthaginians appointed two Generals (Rab, pl. Rabbim) to share military command responsibilities. The office likely developed in the sixth century BCE, during the earliest period of Carthaginian imperialism in North Africa. While on campaign, Carthaginian generals enjoyed total autonomy and possessed powers that are most akin to those held by a king. Carthaginian generals not only decided military strategy and tactics but

also received embassies from foreign states, made treaties, coined money and acted as the chief priest for the army. Most importantly, Carthaginian generals were responsible for the establishment of Carthaginian colonies during military campaigns.

It appears that selection to the office of Rab was to some degree hereditary. The Magonid family of Carthage had numerous members elected to the generalship during the sixth and fifth centuries BCE. In the third century BCE, the Barcid family (including the famous Hannibal) rose to prominence and dominated the office. These family dynasties were essential in providing continuity of leadership for the Carthaginian military during the two periods of its greatest activity.

The Magonids were primarily responsible for Carthaginian actions in Sicily and Sardinia. Mago, who founded the dynasty, and his sons were involved in some of the earliest Carthaginian campaigns in Sicily and Sardinia during the period 550–480 BCE. The last two important Magonid generals known from the sources, Hannibal Mago and Himilco, were responsible for the most successful Carthaginian invasions of Sicily in the late fifth century BCE. Hannibal Mago led initial successful campaigns in 410 and 409 BCE, through which Carthage was able to destroy two important Greek city-states in northern and southern Sicily, Himera and Selinus. His death in 406 BCE transferred power to Himilco. Himilco continued the Carthaginian eastward march across Sicily, and he destroyed numerous Greek city-states in Sicily: Akragas, Gela, and Camarina. After a short interval of peace between 404 and 398 BCE, Himilco resumed his invasion of Sicily and attacked Messina and Catana. By 397/396 BCE, he was so successful that his armies had besieged Syracuse. After a plague decimated the Carthaginian army at Syracuse in 396 BCE, Himilco sued for peace and negotiated the withdrawal of his army from Syracuse along with the maintenance of the majority of Carthaginian conquests in Sicily.

The Chief Priest (Rab Kohanim) was the most important religious official at Carthage. Carthage was a polytheistic society. Some of the most common gods worshiped were Baal Hammon, Tanit, Melqart, Eshmoun, and Ashtart. The priests of each temple were subordinate to the Rab Kohanim who was responsible for the administration of all cults at Carthage. The most widely represented deity in Carthaginian art and iconography is Tanit, a goddess whose cult developed at Carthage in the fifth century BCE. However, the most important god in the Carthaginian

pantheon was Baal Hammon. These two deities were worshiped together at the Carthaginian Tophet, a religious complex and cemetery for the burial of dead infants. Though the Greco-Roman sources believed that the Carthaginians sacrificed infants at the Carthaginian Tophet, archaeological evidence only reveals that the ritual complex served as a crematorium and burial zone for infants. Whether or not these infants were sacrificed remains a matter of active debate.

To administrate its empire, Carthage replicated the office of Shofet at its colonial foundations in North Africa, Sicily and Sardinia. In colonial contexts, the office of Shofet acted as the primary official responsible for local administration. Due to the heavy concentration of Carthaginian colonies in the area of modern Tunisia, the office of Shofet is widely attested in North Africa, while attestations of the office are sparser in Sardinia and Sicily. In Sardinia, the most important Carthaginian colonies were located at Cagliari, Tharros, and Olbia. From these foundations, Carthage was able to develop a series of secondary colonies in Sardinia. In Sicily, the most important Carthaginian colonies were located at Lilybaeum (modern Marsala, Italy) and Selinus (Selinunte, Italy). Both were foundations of the early fourth century BCE. From these two foundations, Carthage secured the necessary ports to supply its colonial armies in Sicily, who remained engaged in nearly constant warfare for 170 years (410–241 BCE).

The presence of legislative assemblies at Carthage remains a matter of conjecture. Though the Greco-Roman sources argue that Carthage possessed both an aristocratic and a people's assembly, no evidence has ever been recovered at Carthage or in Carthaginian inscriptions to confirm the existence of these assemblies. Based on the reconstructions of the Greco-Roman sources, Shofets may have presided over an assembly of aristocrats (a senate) with whom they consulted about matters of administration relevant to the city-state. It is further possible that this assembly of aristocrats was responsible for the election of Shofets from the fifth to the third century BCE. The history of the people's assembly is especially murky at Carthage. In Greco-Roman sources, though the institution may have always existed, the people's assembly only begins to exert power in the third century, when it appears to have assumed the powers once reserved to an aristocratic senate.

The Punic Wars of 264–146 BCE brought about the destruction of the Carthaginian Empire. During the First Punic War, Carthage lost all of its

claims in Sicily and was forced to evacuate its subjects before the transferring control of the island to Rome. After the First Punic War, Carthage's weakened condition allowed Rome to successfully invade and conquer Sardinia, the most important Carthaginian overseas possession. In response to these losses, the Barcid dynasty rose to power in Carthage. The Barcids (Hamilcar and his son Hannibal) attempted to found Carthaginian colonies in the Iberian peninsula during the period 240–220 BCE. The most successful foundation was located at New Carthage (Cartagena, Spain). Carthaginian possessions in Iberia were very short-lived. In the Second Punic War (218–201 BCE), Carthage lost all its colonies in Spain to invading Roman armies. More importantly, Rome followed its victories in the Iberian peninsula with an invasion of the Carthaginian home territory in North Africa. In 202, the Romans and Carthaginians fought the decisive battle of the Second Punic War at Zama. The Roman victory led to the end of the Second Punic War and the final end of the Carthaginian Empire.

Carthage, the city-state, survived another half century until the Third Punic War. A border dispute with its neighbor led the Carthaginians to undertake their first military actions since the Second Punic War. The Romans viewed these actions as a violation of their peace treaty with the Carthaginians. The Romans dictated unrealistic terms, and when Carthage could not meet these terms, invaded North Africa in 149 BCE. Over the next three years, the Romans systematically dismantled Carthaginian supply networks and slowly established a firm siege of the city. By 146 BCE, the Carthaginians were no longer able to resist and the city-state was destroyed by the Romans.

The Romans converted the Carthaginian home territory in North Africa into the province of Africa Proconsularis. Within the province, Carthaginian institutions survived long after the destruction of the city-state. The Carthaginian language, known as Punic, continued to be a commonly used language in the province for the next two centuries. Carthaginian institutions, such as the Shofet, were continued by the Romans to administrate local city-states in the territory. Only in the third century CE do the final vestiges of Carthaginian power finally disappear from the historical record.

Carthage, Siege of (149–146 BCE)

The siege of Carthage is practically coterminous with the Third Punic War because after the Second Punic War, Carthage's territories were greatly reduced. The strategy of the siege emphasized cutting Carthage off from its remaining territory and from relief by land or sea. The city of Carthage was built upon a peninsula that projected into the Gulf of Tunis, protected by a wall between it and the mainland.

In 149, the consuls Gaius Manilius and Censorinus began the siege. Manilius camped his army near Lake Tunis, but had to vacate it because of the unhealthiness of the region. Censorinus blockaded the approach from the sea. After Censorinus returned to Rome to conduct elections, the Carthaginians attacked Manilius' camp. Manilius' forces were saved by the arrival of Scipio Aemilianus. In 148, the consuls Lucius Calpurnius Piso and Lucius Hostilius Mancinus continued to prosecute the siege. Mancinus attacked the Carthaginian suburb of Megara, but was cut off and rescued by Scipio Aemilianus, who had arrived recently in Africa. The efforts of Piso and Mancinus were not successful.

Scipio returned to Rome, where he intended to run for curule aedile. However, the Roman populace called for his consulship and allotment to the African campaign, and by popular acclaim he was made consul even though he was still too young and had not yet held the praetorship. He was also assigned Africa instead of being assigned a province by lot.

Arriving at Carthage, Scipio blockaded Carthage and planned to starve

the city out. He cut off access to the city by land and sea. The Carthaginians built a new channel from the city to their harbor and attempted to sail out, but Scipio's naval forces attacked and defeated them.

In 146, the Romans began to destroy the city, house by house. Reaching the citadel of Byrsa, they stormed it and took the city. Five hundred Roman deserters made a last stand. Scipio sold 50,000 captives and razed the city of Carthage. The nearby African cities that had remained loyal to Carthage were also destroyed. The Romans created a new province, Africa (later Africa Proconsularis).

Carthaginians

Carthage was colonized by Phoenicians from Lebanon in the late ninth century BCE. The colonists spoke a Semitic language, Phoenician. During the first three centuries of its existence (the ninth to seventh centuries BCE), Carthage was a small colonial outpost in North Africa. It acted as a trading post, agricultural center, and fishing port.

In the sixth century BCE, the Carthaginians began to found colonies in North Africa. The earliest Carthaginian colony, Kerkouane, was constructed at the head of a small peninsula 45 miles to the east of Carthage. This peninsula, Cap Bon, would become territorial heartland of Carthage during its imperial period, the sixth to second centuries BCE. From Kerkouane, the Carthaginians founded numerous colonies, forts, garrisons, and villages throughout the entire Cap Bon peninsula. The geography and climate of the Cap Bon were particularly favorable for the cultivation of grain, olives and grapes. By the fourth century BCE, the countryside of the Cap Bon peninsula had been converted into a series of large agricultural estates controlled by the Carthaginian elite. Mago, a Carthaginian writer, produced the first-

known agricultural manual in the western Mediterranean.

Through colonization in North Africa, Carthage acquired dominance over a pre-existing indigenous population. The proliferation of Carthaginian colonies led to creation of hybrid Libyo-Carthaginian culture. Libyo-Carthaginians, in turn, became the manpower basis from which Carthage acquired the necessary soldiers and sailors to sustain its overseas campaigns in Sardinia and Sicily during the fifth to third centuries BCE. Through contact with indigenous populations, Carthaginian language and material culture begin to undergo a series of subtle transitions that differentiate them from other Phoenician populations in the western Mediterranean. The resulting language and material culture are traditionally identified by the term “Punic.”

Punic Carthage was imperial Carthage. During the fourth century, Carthage controlled colonies in North Africa, Sardinia, Sicily, and possibly the Iberian peninsula. The scale of the Carthaginian Empire is best evidenced by two of its engineering achievements: its ports and ships.

The ports of Carthage represent a massive public works project, through which two natural lagoons were converted into monumental harbors. The construction required the removal of ca.120,000 cubic meters of earth for the rectangular harbor and another ca.115,000 cubic meters of earth for the circular harbor. Dry docks, which surround the circular harbor, could store ca. 200 warships during periods of inactivity.

Recovered Carthaginian warships of the third century BCE indicate an industrial arrangement for their construction. The planks that form the outer shell of the ship were prefabricated and labeled with a specific letter or mark. Thus the ship builder was required only to assemble the ship according to the established design. Furthermore, individual workshops fabricated a single plank type, which allowed for consistency in manufacture and by extension consistency in ship construction.

Carthage's defeat in 146 BCE was followed by the destruction of the city-state. However, due to Carthaginian imperialism, Roman conquest did not destroy Punic culture, Punic language or even Carthaginian political systems in North Africa. These would last for centuries after the collapse of the city-state and its empire.

Carus (Emperor) (282–283 CE)

A Roman emperor (282–283 CE), Marcus Aurelius Carus, of Gallic origin, was an army officer who served as praetorian prefect to the emperor Probus. After successfully revolting against and deposing Probus and seizing the throne himself, Carus embarked on a campaign against the Sarmatians in the Balkans. He soon turned his attention toward the Persian Empire, which he invaded together with his youngest son Numerian. His elder son, Carinus, remained in Europe to administer the western provinces. Carus successfully captured the Persian city of Ctesiphon but died in 283 CE after his tent was struck by lightning. Carus is treated briefly by the epitomators Eutropius and Aurelius Victor; the longer Life of Carus, Carinus, and Numerian in the *Historia Augusta* is unreliable.

Cassius, Spurius (d. 483 BCE)

Spurius Cassius Vecellinus was an important political figure in the very early republic. Consul three times, he provides an early example of a demagogue who incited unrest against the Senate.

Cassius first appears as consul in 502 BCE. He celebrated a triumph, though whom he fought is unclear. A year later he was selected by Titus Larcus Flavus, the first dictator, as his second-in-command, becoming the first *magister equitum* or commander of cavalry. In 493, as consul for the second time, Cassius achieved his most recognized political success, negotiating a treaty with the Latin cities, the so-called *foedus Cassianum*. This was a defensive alliance, which included some reciprocal citizenship rights. Finally in 486, in his third consulship, he defeated the Hernici, celebrating a second triumph.

This was the height of his political career: Cassius was accused of attempting to make himself king and was executed the following year after a trial for treason. According to the sources, he proposed populist measures including granting state land to the urban poor and Latin allies. The actions reported are anachronistic, anticipating the Gracchan reforms of the late republic, but, as with Spurius Maelius soon after, the bare fact of attempted revolution is usually accepted. The significance of Spurius Cassius is that he represented for the Romans the earliest example of a demagogue: the archetypal would-be tyrant.

Cassius Chaerea was a tribune in the Praetorian Guard who headed the conspiracy to assassinate Gaius Caesar (Caligula). When he was younger, Chaerea served as a centurion under Germanicus in Lower Germany, where he distinguished himself as a skilled fighter during the mutiny that followed the death of Augustus. As an older man, he served in the Praetorian Guard under emperor Gaius who relentlessly mocked Chaerea for his supposed effeminacy. Enraged by these taunts, he headed the conspiracy to murder Gaius and struck the first blow with his own sword. The emperor Claudius would later execute him for his role in the assassination.

Cassius Dio (ca. 164–235 CE)

Cassius Dio was a Roman consul and historian who is known primarily for his composition of the *Roman History*. Cassius Dio was born ca. 164 CE, as a native of Nicaea in Bithynia. His father, Cassius Apronianus, became a senator not long after Dio's birth, and it is likely that Dio spent a large portion of his boyhood at Rome. During his adult years, Dio was a member of the Senate under nine emperors—Commodus, Pertinax, Didius Julianus, Septimius Severus, Caracalla, Geta, Macrinus, Elagabalus, and Alexander Severus. Dio's own *cursus honorum* is frequently disputed by modern scholars. It is almost certain that he held a praetorship in the year 194. Dio explicitly states in book 73 of the *History* that, upon the accession of Pertinax in 193, he received from the emperor an appointment as praetor for the following year. Given Dio's date of birth, it is also likely that Dio had previously held a quaestorship under Commodus in approximately 189, as well as a tribunate in about 191. During the latter half of his career, Dio likely held two consulships—initially as suffect consul under Septimius Severus around 205 or 206 and subsequently as consul with Alexander ca. 229. Prior to his second consulship, Dio also served as proconsul of Africa

ca. 223 as well as imperial legate of Dalmatia, then as legate of Upper Pannonia ca. 224–228.

Cassius Dio authored several no longer extant works, including a short book on dreams and omens that lead up to the accession of Septimius Severus and a biography of his fellow countryman Arrian, who lived ca. 90–160 CE. Dio's pre-eminent work is the *Roman History*, written in 80 books. Modern scholars debate when Dio composed his history. In book 72 of the history, Dio identifies a period of 22 years in which he both collated material for and composed the *Roman History*. This period almost certainly took place either during the reign of Severus (193–211) or just after the emperor's death, and may have extended up until Dio's own death in 235.

Dio's history begins with legend, including the arrival of Aeneas in Italy and the founding of Rome in 753 BCE and follows with the rise of the Roman Republic and its decline into civil war, continuing with the reign of Augustus and the subsequent emperors until the reign of Alexander Severus ca. 229 CE. Dio's history has an annalistic structure. However, Dio frequently diverges from this structure by introducing observations about historiographical problems associated with Republican or imperial sources or ethnographic and geographical digressions. Moreover, Dio makes extensive use of speeches, which he regularly includes in the imperial portion of his history as both a means of characterizing the key players and signposting the most important events.

Although Dio's text offers one of the most extensive histories of the Roman Republic and empire, there are several problems with using Dio as a primary source. Dio's original text has only survived today in a fragmentary form. Dio's original text is preserved only in books 36–54, substantial fragments of books 55–60 and in a section containing parts of books 79 and 80, from the death of Caracalla to the middle of Elagabalus' reign. There are, however, three main sources from which the missing text can be restored, the earliest being tenth century CE Byzantine scholars' excerpts. These excerpts are of great value for the restoration of Dio's text because they largely preserve Dio's own wording and cover the entire range of Dio's history. During the eleventh century, the monk Xiphilinus of Trapezus composed an epitome of books 36–80. The epitome fills gaps in books 56–60 and comprises the majority of Dio's work, as we know it today, from book 61 onward. Half a century after Xiphilinus, Zonaras composed an epitome from creation to 1118, using Dio for his books 7–9. His epitome is

the most important source for reconstructing the republican period of the *Roman History*.

The second major problem with Dio's work concerns the historian's use of sources. The fragmentary nature of Dio's surviving text has damaged our ability to identify the historian's original sources. Dio only cites two sources explicitly in the *Roman History* – Augustus' biography and Hadrian. Dio, nonetheless, claims to have read "virtually everything written by anyone about [the Romans]" and modern scholars have identified references in the *Roman History* to authors such as Livy, Sallust, Arrian, Pliny the Elder, Cicero, and Septimius Severus.

Despite the ambiguities associated with Dio's use of sources, the *Roman History* remains a valuable resource. Dio's history is one of the few continuous accounts of the empire from Nerva to Commodus as well as the Severan dynasty. The only other primary sources for the period consist of the *Roman History* of Herodian; Aurelius Victor's short history of imperial Rome, *De Caesaribus*; Eutropius' *Breviarium*; the *Epitome de Caesaribus*, of unknown authorship; and the notoriously unreliable *Historia Augusta*, a collection of imperial biographies. Second, even for the period of the early Empire, where alternative sources are abundant, Dio offers a largely unique account of events. Finally, as a senator whose public career encompassed the reigns of Commodus and the Severan emperors, Dio was well placed to record the vicissitudes of Roman political life. Dio himself protests that, after the inception of the empire, accurate information had become increasingly difficult to come by as rulers commonly kept their acts and discussions secret; and their censored accounts, when made public, were looked upon with doubt and suspicion. Yet the historian nonetheless records evocative details of the court rivalries, treason trials and the personalities of the individual rulers under which he served. As a first-hand witness to Commodus' performances in the arena, Dio and his fellow senators observed the emperor behead an ostrich and, brandishing the bird's head, threaten them with the same fate (Dio 73[72].21.1–2). Dio also observed the series of civil wars, coups and assassinations from 193 to 222 with a mordant eye. Prosenatorial in his views, Dio disapproved of the rise of the provincial armies in imperial affairs; and he regarded the Pannonians, whom he governed in the mid-220s, as brutal and uncivilized (Document 25). Most famously, Dio regarded the history of his own time as passing from an "age of gold" under Marcus Aurelius to an "age of iron and rust"

(Dio 72[71].36.4).

Cassius Longinus (ca. 85–42 BCE)

Gaius Cassius Longinus, one of the most famous assassins of Caesar, belonged to an aristocratic family that had produced numerous consuls. Little is known of his early life, apart from a story that he showed dislike of despotism while still at school by quarreling with the son of the dictator Sulla. He studied philosophy and Greek at Rhodes. He was married to Junia Tertia, a daughter of Servilia, and thus a half-sister of Brutus, and they had one son, born about 60.

He served as quaestor under Crassus against the Persians; following the disaster at Carrhae he escaped with remnants of the army and successfully defended Syria against Persian attacks for the next two years. Returning to Rome in 50, just before the civil war between Caesar and Pompey started, he was elected tribune for 49 and took the side of the optimates. Shortly after Caesar invaded Italy, Cassius left for Greece to join Pompey, and was appointed commander of part of the fleet. His most notable success was off Sicily in 48 when he destroyed a large part of Caesar's fleet.

When Cassius heard of Pompey's defeat, he headed for the Hellespont, but was overtaken by Caesar's troops and forced to surrender. Like Brutus, he was pardoned by Caesar, absorbed into his organization and appointed legate in the Alexandrian War. He refused, however, to join the campaign against Cato in Africa, retiring to Rome instead.

Cassius spent the next two years without office, until made praetor peregrinus for 44; the appointment of Brutus, his junior, to the more

prestigious urban praetorship offended him. Alarmed at Caesar's growing domination, Cassius plotted against him and persuaded others to join the cause of removing the tyrant, including Brutus, who came to the conspiracy late but who was nevertheless seen as the leader.

Celebration over the tyrant's removal, however, was short-lived, as popular outrage forced the conspirators to leave Rome. Mark Antony had seized control, and Cicero criticized the assassins for not removing him as well. Cassius had wanted to, apparently, but Brutus vetoed the move. Both Cassius and Brutus soon left Italy to take up commands in Syria and Asia assigned to them by the Senate. When Octavian seized a consulship in 43 and had the assassins declared enemies of the state, he put aside differences with Mark Antony and formed the Second Triumvirate with him and Lepidus, to pursue Brutus and Cassius, who had systematically acquired control of armies and treasuries in the eastern Mediterranean and who were heading toward Italy. The sides fought two battles at Philippi on October 3 and 23, 42; Cassius lost the first to Mark Antony and committed suicide, unaware that Brutus had been victorious against Octavian in his sector of the battle. He was buried in Thasos in Greece, mourned by Brutus as "the last of the Romans."

Cassius was interested in philosophy from an early age, when he studied in Rhodes. Initially he was an adherent of the Academy, but sometime between 48 and 45 he converted to Epicureanism. This school of thought advocated withdrawal from politics, but in Rome many public figures accommodated their careers to their belief in it. It is not clear whether Cassius tried to justify the removal of Caesar on Epicurean grounds. There was a family history of defense of *libertas* (= "freedom"), judging from the images and legends on coins issued by the Cassii, particularly in the 50s, and by Cassius himself, so he may have followed that tradition also.

Casualties

For Roman warfare, we possess no accurate or precise casualty statistics. Though Roman generals and their staff who planned campaigns presumably knew the exact number of their troops to pay and supply them adequately, these exact numbers (attested in military strength documents from the early empire) were not recorded by literary authors. Ancient literary authors preferred round numbers (e.g., 5,000, 10,000, or 80,000) written as words rather than digits. Ancient numbers are particularly prone to being garbled in manuscript transmission (repeated copying of texts by medieval monks). Furthermore, the Roman cultural emphasis on victory meant that they did not list their war dead on most war monuments. The only surviving instance is the altar of Domitianic date (*ILS* 9107), near Adamklissi in Romania, listing over 3,800 Roman soldiers who died during war with the Dacians in the 80s. Nearby, Trajan built his own monument to his victories over the Dacians in 101–102 and 105–106, the *Tropaeum Traiani*, which does not list the dead.

In the republic, the custom of the triumph probably recorded enemy casualties, but little information has come down to us. Commanders were required to report Roman and enemy casualties to the Senate (Livy 2.8.1); according to Valerius Maximus (2.8), a commander needed 5,000 enemy casualties to be awarded a triumph, while according to Appian, *Civil Wars* 2.44, he needed 10,000 enemy casualties to be hailed as *imperator* (during the republic, before *imperator* signified the emperor). These conflicting statements are not supported by extensive other evidence. In the second century BCE, many generals who requested triumphs from the Senate were challenged by political rivals to defend their claims. These “triumphal debates” do not focus on numbers of enemy casualties (Pittenger 2008). In any case, commanders seeking triumphs were probably likely to inflate their numbers.

Aside from great military disasters, Roman losses in battles were

relatively light. Greek soldiers and Hellenistic mercenaries (such as Hannibal used) were comparably trained and equipped. Barbarian enemies from less developed or poorer societies often were not. The ancient authors record huge numbers of slain and captured non-Roman enemies, sometimes on a genocidal scale; allegedly, Julius Caesar's Gallic Wars resulted in the death of one million Gauls and the enslavement of one million Gauls (Pliny the Elder, *Natural History* 7.92). At the battle of Mons Graupius, according to Tacitus, 360 Romans died, or about three percent of 13,000 Roman auxiliary troops; 10,000 Britons died (Tacitus, *Agricola* 37). In the suppression of the Boudiccan revolt (60/61 CE), 400 Romans died, in contrast with 80,000 Britons (Tacitus, *Annals* 14.37). In the Roman suppression of the Bar Kochba revolt (132–135 CE), 580,000 Jews died, according to Cassius Dio (69.14).

Roman casualties from military disasters are subject to the same numerical inflation, but their impact can be estimated from subsequent recruitment policies. After the battle of Cannae (216 BCE), the Roman state instituted extraordinary levies, freeing and enlisting slaves, who were normally excluded from the army. At the battle of Arausio (105 BCE), 80,000 Romans allegedly died; Gaius Marius introduced the recruitment of the propertyless *capite censi* around the same time. Three legions were lost in the Varus disaster of 9 CE, or about 15,000 men; to replace the losses, Augustus enlisted freedmen and freeborn citizen volunteers. After the disastrous battle of Adrianople (378 CE), the emperor Theodosius I (379–395) stepped up the incorporation of barbarian allies, the *foederati*, organized under their own leadership rather than incorporated into Roman auxiliary units as in the earlier empire.

In military disasters, Roman commanders and officers were expected to face death with their men rather than risk the humiliation of capture by the enemy; survival itself might bring humiliation. It is not possible to estimate how many Roman officers routinely died in combat, but literary narratives provide anecdotal evidence that, at least during the Hannibalic War with its staggering Roman defeats at the battles of the Trebia (218 BCE) and Lake Trasimene (217 BCE) and Cannae (216 BCE), Roman nobles died in disproportionate numbers. The ideology of self-sacrifice manifested as scorn for the survivors of these defeats. Thus the Roman Senate repudiated the survivors of Cannae as cowardly, refused to reincorporate them into the army, and exiled them (Livy 22.61.14, 23.25.7–9, 24.18.9, 25.7.3–4). At a later

date, the Senate leader Marcus Aemilius Scaurus refused to admit his son to his presence after the latter survived the Roman defeat at Arausio (105 BCE). The younger Marcus Aemilius Scaurus committed suicide out of shame (Valerius Maximus 5.8.4). As an extreme form of self-sacrifice in battle, a Roman warrior might practice *devotio*, vowing his life to a god in return for victory; however, such practices are usually attributed to the earlier and more legendary republic.

Even if they did not die in battle, Roman fighters gained prestige from displaying the scars of battle wounds. Ideally such wounds were all on the front of the fighter's body, indicating that he had not turned and fled from the enemy. Plutarch's *Roman Questions* ch. 49 (*Moralia* 276c–d) claims that Roman nobles campaigning for office used to wear togas without tunics so as to display battle scars on their upper bodies and attest the *virtus* (courage) they had displayed in combat. The display of battle scars might also be a claim of “new men” such as Cato the Elder and Gaius Marius (Sallust, *Jugurthine War* 85.29), depicting their rivals as effeminate. Battle scars added to the prestige also gained by military decorations and single combats. However, this rhetoric of scars is also attributed to the earlier and mid-republic.

The Roman nobility's personal experience of combat and of combat probably declined in the late Republic, but did not die out. A shift in the depiction of battle wounds and scars occurs in Julius Caesar's *Gallic Wars* and *Civil War*, emphasizing the bravery, deaths in combat, and wounds of his common soldiers, of centurion rank and below, rather than his noble officers. Though not attested in Caesar himself, according to Florus, Plutarch and Appian, before the battle of Pharsalus (48 BCE) Caesar ordered his men to strike at the faces of the young Pompeian nobles so that these men would turn and flee rather than risk scars that would damage their good looks (Florus 2.13; Plutarch, *Pompey* 69; Appian, *Civil Wars* 2.76). However, Roman officers and commanders continued to die in combat, as did Marcus Licinius Crassus at Carrhae (53 BCE), the rebel leader Catiline at the battle of Pistoria (62 BCE), and the consuls Hirtius and Pansa at the battle of Mutina (43 BCE). In civil warfare, a defeated Roman commander and his officers might commit suicide rather than face the humiliation of seeking clemency from the rival leader; Cato the Younger, Brutus, and Cassius chose to kill themselves thus in the civil wars of the late Republic. In the Principate, Roman senatorial officers also participated in and died in combat, for

example, Quinctilius Varus and his officers in the Varian disaster of 9 CE or the commanders in Domitian's Dacian Wars (85–89 CE), so that to speak of the imperial aristocracy as “demilitarized” in comparison with the republic is an exaggeration.

In addition to deaths on the battlefield, modern casualty estimates should include soldiers who died from the complications of their wounds. In Western nineteenth-century warfare, such as the Crimean War or the American Civil War, 17–20 percent of wounded soldiers died from infected wounds. Wounds from bullets and artillery shells were particularly liable to infection. In contrast with bullet and artillery wounds, slash or stab wounds from swords and spears are lower in energy, introduce less dirt into the wound (if the enemy has not deliberately tainted the blades), and result in less tissue damage. Thus Roman sword and spear wounds to the limbs may have been more survivable, as long as the injured man was not crippled and did not succumb to loss of blood (Rosenstein 2004). Military medical personnel attended the battlefield; on Trajan's Column they are depicted binding up wounds. Blade wounds that penetrate the head, thorax or abdominal cavity and lacerate vital organs are much more serious, but these areas of Roman soldiers' bodies were protected by armor.

In peacetime, more Roman soldiers probably died from contagious diseases than in combat or from infected wounds. Living in communal conditions promoted the spread of disease. The Praetorian Guard, recruited from Italian towns and stationed in the city of Rome, were exposed to the megacity's diseases and, as a result, some died untimely (attested by grave epitaphs). The Antonine plague of the 160s–170s CE, possibly measles or smallpox, was brought to the Roman Empire by soldiers returning from the Persian frontier, and decimated the Roman army.

Catalaunian Plains, Battle of the (451 CE)

The battle of the Catalaunian Plains was one of the major battles of the later Roman Empire, in which the western Roman army supported by the Visigoths and other barbarian allies defeated the Hunnic confederation led by Attila the Hun. The battle took place at an unidentified location in northeastern Gaul, probably between modern Châlons-sur-Marne and Troyes, in the summer of 451.

In 450, the new eastern Roman emperor Marcian refused to pay tribute to the Huns. Therefore, Attila decided to raid Italy on the pretext of marrying the imperial princess Honoria, sister of Valentinian III. Honoria allegedly had invited Attila to rescue her from an arranged marriage, offering to marry Attila. To facilitate his invasion, Attila decided to collect followers among the western Franks, Visigoths, Vandals, and *bacaudae* (independent brigands and militia led by lesser aristocracy). The Vandals remained neutral, while the Visigoths decided to side with the western Roman government. Various Frankish groups joined both sides.

Attila crossed the Rhine in April 451, sacking various cities such as Metz and Trier. The Huns and their tributary allies had marched hundreds of

miles from their heartland in central Europe. Attila's forces, which did not have sophisticated logistics, spread widely over northern Gaul as they raided various cities. Eventually they converged on and besieged Orléans in June. The city was a headquarter of the western Roman military, defended by an Alan garrison. However, the timely arrival of Aetius' armies forced Attila to retreat on June 14. Eventually both armies collided a week later.

A full description of the battle can be found in Jordanes (*Getica*, 191–218). Aetius took command of the right flank with the western Roman field army, with the Alans in the center and the Visigoths on the left flank. Attila commanded the center of his forces, supported by Gepids, Rugi, and various Gothic groups who later became the Ostrogoths, on both flanks. The Visigothic king Theoderic I (not the same person as Theoderic the Ostrogothic king of Italy, s.v.) was killed during the first charges, but his son Thorismund took over his command and, aided by Aetius' cavalry, occupied a strategic hill on the battlefield. After a day-long battle, both sides retreated at nightfall without a clear victory. Attila and his Hunnic forces, however, withdrew to central Europe.

It is impossible to estimate how many combatants were involved. Jordanes claims that 160,000 fell on both sides while one western chronicler states that 300,000 people fell. These numbers are severely exaggerated, given that field armies of this era rarely exceeded more than several 10,000 soldiers. Another chronicle describes an incalculable slaughter on both sides. Tactically, the battle was a stalemate. However, Aetius and his allies scored a considerable strategic victory due to the retreat of the Huns. After this setback Attila never regained his past success; his fortuitous death from natural causes caused the Hunnic confederation to collapse. The battle was unusual in ancient European history for the sheer diversity of political groups involved—ranging from the Atlantic to the Black Sea.

Cataphractarii

Equites cataphractarii were the most heavily armored cavalry utilized by the imperial and late Roman armies. The Roman army adopted cataphract units in response to its experiences battling Sarmatian and Persian cataphracts along the Danube and on the eastern frontier. The Sarmatians and Persians had inflicted numerous defeats upon Roman legions, one notable example being the battle of Carrhae in 53 BCE. While the Romans maintained some *cataphractarii* units in the western empire, they primarily served on the eastern frontier. Unlike the cataphracts of their opponents, who represented the wealthy elite, Roman *cataphractarii* were professional soldiers from no particular social stratum.

Cataphractarii were covered from neck to toe in armor, usually scale or mail, and their horses were armored likewise. Their primary weapon was a long lance called the *contus*, though they also carried a sword or mace as a secondary. Some also carried bows or darts. Their heavy armor gave them excellent protection in battle, and their impact in battle can be likened to a modern “tank.”

The use of *cataphractarii* varied greatly from regular Roman cavalry, which traditionally were lightly armed and used more for skirmishing than for offensive onslaughts. *Cataphractarii* excelled at shock charges against an enemy’s flank, though they suffered two key weaknesses from their cumbersome equipment. They had to maintain tight formation, as lone riders could be surrounded and overcome quickly. In addition, horse and rider alike could quickly overheat and tire in pitched combat, leaving them vulnerable.

The first Roman *cataphractarii* were *auxilia* during the reign of emperor Trajan (98–117 CE). Though they remained relatively scarce during the Principate, by the sixth century, *cataphractarii* had become elite units of the Roman army. The unit would become a staple in the eastern Roman Empire, and the future Byzantine army would become famous for its *kataphraktoi*.

Catiline (108–62 BCE)

Catiline (Lucius Sergius Catilina) was one of the late republic's most notorious political agitators, plotting against the Roman state in 63–62 BCE. He was born into an old patrician family, but one not prominent for many generations—their last consulship had been in 380 BCE. Catiline seems to have been motivated to revive his family's reputation by securing a consulship for himself and restoring his finances.

After service in the Social War in 89, we next hear of him on Sulla's side in the civil war (83–82). He benefited from the rewards provided by Sulla, but there are stories of unscrupulous conduct: for example, he is alleged to have beheaded his brother-in-law, Marius Gratidianus, and then asked Sulla to add his name to the proscription lists to legalize the murder. There were accusations of other murders and even incest. In 73, he was tried for adultery with the Vestal Fabia, but leading senators secured his acquittal. Such stories probably resulted from later hostile propaganda, promoted by opponents such as Cicero.

After a praetorship in 68, Catiline was governor of Africa for two years. On his return in 66, he tried to run for supplementary consular elections, held because the originally successful candidates had been found guilty of electoral corruption. Around the same time African provincials came to Rome complaining of Catiline's misconduct while governor, so his candidature was disallowed. Tried for misconduct the following year, Catiline was acquitted, again helped by distinguished senators, though bribery was suspected. Cicero actually considered defending him in court, even though he commented privately that his guilt was clear.

In 65 came rumors of the so-called First Catilinarian Conspiracy. Supposedly, Catiline conspired with Gnaeus Piso and the two displaced consular candidates to kill the new consuls on the day they entered office, along with some senators. The sources, written after the event, when it was

known how Catiline turned out, give differing accounts, laying the blame on various individuals, including Crassus and Caesar. Cicero, at least later, asserted that Catiline was the ringleader. It is thus not clear who participated, or whether such a “conspiracy” even existed. The whole thing was probably fabricated from the vague mutterings of some disgruntled political players.

Catiline still hoped to obtain the consulship legitimately. He ran for the elections in 64 on a joint ticket with Gaius Antonius Hybrida, both possibly financed by Crassus, but Catiline lost to Cicero and Antonius. Though a “new man,” Cicero was preferred by the conservatives, who may have been concerned about Catiline’s powerful backer, while Cicero himself ran a successful scare campaign.

Catiline was prosecuted again later that year under a special court investigating those who had profited from the Sullan proscriptions. Catiline was acquitted yet again, possibly through bribery supplied by Crassus, or perhaps through the influence of the court president, Caesar.

Catiline tried a third time to secure a consulship in 63. However, he had now lost much of his political support, while his policy of cancelling debts, ostensibly to help the urban plebs, but more likely to benefit spendthrift nobles like himself, alienated the conservatives. The elections were conducted by Cicero as consul, theatrically wearing a breastplate beneath his toga to suggest he needed to protect himself. Catiline lost again and now turned to more desperate measures to secure the office he thought that he as a patrician he was entitled to.

He collected together a conspiratorial gang of ex-senators and equestrians, whose ambitions, like his, had been thwarted or who sought restoration of their senatorial status and lost political power; men such as Lentulus Sura, consul in 71, who had been removed from the Senate by the censors, Autronius who had lost the consulship of 65, and Cassius Longinus who had failed at the consular elections in 64. With his policy of debt relief, Catiline appealed to the poor both in the city and in the countryside, including large numbers of Sulla’s veterans, who had failed to make their land allotments productive.

Catiline sent Gaius Manlius, a Sullan ex-centurion, to collect an army in Etruria, where many of Sulla’s veterans were; others were sent to foment trouble in other parts of Italy. Meanwhile, Catiline continued preparing the conspiracy in Rome—or so Cicero claimed. The plans included arson and

murder of senators, after which the conspirators would leave to link up with Catiline and Manlius' army, return to the city, and take control. Cicero was kept informed of these plans by Fulvia, the mistress of Quintus Curius, one of the conspirators. For some months Cicero tried to warn the Senate, but failed to convince them. Foiling an attempt on his own life on the morning of November 7, 63, he called a Senate meeting the following day and denounced Catiline, who was present. That night Catiline abandoned Rome and joined Manlius in Etruria to proceed with his plans for armed insurrection.

Some associates left in Rome continued the conspiracy there. They negotiated with envoys from the Allobroges who happened to be in the city, hoping to gain their support. They provided the envoys with letters, but in a trap prearranged with Cicero the letters were seized, giving him finally the evidence needed to arrest five leading conspirators. Cicero had the incriminating letters read to the Senate the next day, and after a long debate the conspirators were condemned to death without a trial, despite a strong speech by Caesar against the death penalty. Cicero had them executed in prison immediately.

The news of the executions was a major setback to Catiline. On hearing it, many deserted his army, reducing it to just 3,000 men. The consul Antonius was sent against this small, badly equipped army; despite moving around north Italy to avoid a confrontation, Catiline was eventually caught between Antonius' army and that of Metellus Celer in the north and forced to fight. He chose to engage Antonius' army, commanded by Petreius, near Pistoria (Pistoia). In his account, Sallust says that Catiline fought bravely in the battle: when the corpses were viewed, all of Catiline's soldiers were found with frontal wounds, while Catiline's body was found far in advance of his own front line.

After Catiline's death, many of the poor still regarded him with respect and not as a renegade. Even Cicero admitted later (Cicero, *Pro Caelio* 12–14) that he himself had once nearly been taken in by Catiline and that he was a strange mixture of the greatest virtues and the worst vices.

Cato the Elder (234–149/8 BCE)

Cato the Elder (Marcus Porcius Cato Maior) was a general and politician born in Tusculum in 234 to an affluent equestrian family. He was a *novus homo* (new man) who, with the backing of the patrician Lucius Valerius Flaccus, climbed swiftly up the *cursus honorum* (ladder of offices) to become consul in 195 and censor in 184. He is perhaps better known as a political personality with immense oratorical skills and a vast literary output. His treatise on agriculture is extant, but only fragments of his other works and orations survive.

As a soldier, he served successfully in southern Italy, in the Second Punic War, particularly at the Siege of Tarentum (mod. Tarento) in 209, and then two years later at the decisive battle of Metaurus (mod. River Metauro, north Italy) defeating Hannibal's brother Hasdrubal. Ever wary of Carthage, he coined the phrase: *Carthago delenda est* (Carthage must be destroyed).

In the year of his consulship, Cato was assigned to Nearer Spain where his tactical and ruthless martial skills enabled him and his forces to reduce much of the area to subjection. He won a decisive battle at Emporiae (mod. Ampurias) and exploited the region's minerals. His successes were rewarded with a Roman triumph. In 191, as a military tribune, he was instrumental in the defeat of Antiochus III at Thermopylae. Toward the end of his career, Cato urged Rome to the Third Punic War (149–146 BCE).

Cato lived to the ripe old age of 85 and was given a biography by Plutarch of Chaeronea. Better remembered as an accomplished statesman, Cato was also an exemplary and respected soldier.

Cato the Younger (95–46 BCE)

Cato the Younger (Marcus Porcius Cato Minor) (also called Cato Uticensis) was a politician and statesman born in Rome in 95. He was the great-grandson of Marcus Porcius Cato Maior and noted for emulating his ancestor. Little is known of his early life but his uncle, Marcus Livius Drusus, raised him. Cato the Younger gave intellectual support to the optimate (conservative) faction in the late republic. His ideology was based on Stoic philosophy and he demanded respect for Roman traditions.

Very early on in his political career, Cato became leader of the *optimates* (“best men” or oligarchic faction) in 63 and was vehemently opposed to Caesar, clashing with him over the execution of the followers of Catiline. Indeed, Cato tried to incriminate Caesar in that conspiracy. For this, Cato was shifted aside to Cyprus in 59 to administer its annexation. His antagonism to Caesar intensified and he, perhaps reluctantly, followed Pompey to Dyrrhachium (mod. Durres, Albania) in 48, which he held for him until Pompey was defeated at Pharsalus in August of that year. Cato then left for Africa with Quintus Caecilius Metellus Scipio to continue the Pompeian struggle and took command at Utica. But, when Scipio was defeated at the battle of Thapsus (in mod. Tunisia) in 46, Cato committed suicide rather than accept Caesar’s pardon.

Like his great grandfather before him, Cato was given a biography by Plutarch of Chaeronea, which finishes with the famous scene of his death. Perhaps not as adept a soldier as Cato Maior, Cato the Younger is best remembered for his principled hostility to Caesar and his rigorous support of the traditional republic.

Cavalry (Imperial)

The development and use of cavalry in the Roman military systems during the imperial period is complex. While there is advancement in the cavalry branch, development was slow and reactive through this period. It was influenced by peoples from outside the empire who had much more familiarity with horses than did the Romans; some of their practices diffused through the empire from extended contact or may have been deliberately adopted by the Romans.

During the first two centuries CE of the empire, Roman cavalry continued to be raised and utilized in the same manner as during the late republic. Most cavalry recruited from citizens was attached in small squadrons (*alae*) to individual infantry legions to give those legions the ability to function independently. The men who became cavalry commanders were Roman citizens from the wealthy equestrian order, sons of rich merchants and large landholders. By the late first century CE, a typical cavalry commander had served as *praefectus cohortis* (commander of an infantry cohort) and *tribunus militum* (legionary tribune) before becoming a *praefectus alae*. The lower ranking officers (decurions) and soldiers within cavalry units, if citizens, were recruited from below the equestrian order, typically from rural Italians or provincials. The larger

independent cavalry units were predominately raised from non-Roman allies with a strong horse-riding tradition. These units were allowed to name their own chiefs as low and midlevel officers of the unit, but Roman citizens were usually placed in overall command of the unit. It was not unheard of, however, for trusted chieftains to be granted command, especially outside the borders of the empire. Over time, however, the ethnic identities of imperial cavalry unit members may not have stayed the same as the tendency became to recruit locally.

The Roman cavalry began to change as the Roman army began to engage more and more with the horse-riding peoples of present day central and eastern Europe and the Persians in the Middle East. These peoples introduced new horse technologies and cavalry tactics to the Romans that the Romans would slowly adopt over the next few centuries. These new types of cavalry included light cavalry such as horse archers as well as heavy cavalry such as cataphracts. While the Romans never raised indigenous units of either type, they did adapt to using allied troops that were proficient in both forms as well as hiring mercenaries to fill their need for both, especially in the eastern imperial region.

Major changes in the imperial cavalry system began in the mid-third century CE under the emperor Gallienus (253–268). Gallienus created a mobile defense and strike force composed mostly of cavalry. This force was comprised of medium and heavy cavalry and located at Milan, a central location capable of responding to threats from the border region or from rivals to the imperial throne in the western provinces of Gaul.

The next advancement in Roman cavalry was under Diocletian (284–305) and accompanied the reorganization of the Roman administrative system. Reorganizing the Roman governmental structure supported a larger military institution. This allowed Diocletian to raise more cavalry units and to increase the size of the ones already in existence. It also allowed him to create specialized cavalry units for the first time, including imperial guard cavalries. Once created, these units would become a permanent part of the Roman military system. It is unclear what policy Diocletian took toward the central cavalry force.

Monument of cavalryman. The tombstone of Flavius Bassus, a first-century CE horseman of the ala Noricorum depicts a Roman cavalryman riding down a barbarian. This motif is one of the most common images on Roman military tombstones. *CIL* XIII 8308. Located in the Romano-Germanic Museum, Köln, Germany. (CM Dixon/Print Collector/Getty Images)

Constantine (306–337) placed even more emphasis on cavalry than infantry in the organization of the Roman army. Under Constantine, the need to rapidly respond to threats, both foreign and domestic, motivated the change to a more mobile system instead of the slower moving infantry troops of the past. With the need for more and better trained cavalry, the later Roman army emphasized the development of cavalry equipment and training of cavalry troops. Both Zosimus (2.55, on Constantine's reorganization of the army) and Vegetius regard the fourth- and fifth-century emphasis on cavalry as detrimental to the Roman army, since infantry legions had formed the backbone of the traditional Roman army. Cavalry would continue to dominate the Roman military until the fall of the western empire in 476, and it stayed the core of the eastern empire forces until its fall to the Muslims in 1453.

Roman cavalry during the Principate, both indigenous and allied, was predominately light cavalry. Light cavalymen rode small, fast horses, wore little to no armor, and were armed with a spear (*contus*). While mounted archers were common throughout the imperial period, horse archers never became a standard of the Roman cavalry force. The primary role of Roman light cavalry was to scout for the main force, provide couriers and convey communications, and assist in foraging. During battle, they would be used to guard the flanks of the main infantry force, attack the flanks and rear of the enemy, and pursue a fleeing enemy to prevent them from regrouping. This began to change during the latter years of the first millennium CE as the Romans encountered more peoples better versed in the use of horses.

Heavy cavalry became a standard part of the Roman military system in the latter half of the third century CE. Called cataphractarii or *clibanarii*, these horsemen wore heavy metal armor from head to foot and were armed with shields, swords, and heavy spears. Elite forces were raised as imperial bodyguards. Although heavy cavalry of this type existed as far back as Alexander the Great, the Romans regarded them as less useful since they were ineffective against formed infantry units. With the advent of the Sassanid Persian Empire, however, the combination of improvements in cavalry capabilities coupled with a reduction in infantry capabilities made heavy cavalry much more effective. With their improved production, this style of heavy cavalry would remain a mainstay for the Romans.

Roman cavalry was never truly the equal of its opponents. The Romans continued to rely on allied cavalry and mercenaries for the majority of their horsemen throughout the empire period and never developed an indigenous cavalry force of note. The Persian cavalry (Arsacid and Sassanid) east of the Roman Empire was always a threat and able to fight the Romans as equals. The migratory groups which raided the empire in the later period (fourth and fifth centuries CE) were much better horsemen than the Romans and continually bested the Roman cavalry. The best example of this was the Huns under Attila.

Cavalry (Republic)

A balanced premodern army has three parts: foot troops (infantry), horse troops (cavalry), and large crew-serviced weapons (artillery). The Roman army is no different. It is well known for its legions of infantry and for its superbly engineered artillery, relying on torsion-powered devices such as catapults. Less attention is paid to the cavalry branch of the Roman military, however. This is largely due to the nature of Roman combat and the economic restrictions involved in raising large numbers of cavalry troopers.

The geography of the Italian peninsula does not lend itself to the raising and training of large numbers of horses. Because of this, horses in the Roman Republican era were very expensive. Most animal power was provided by other, nonmilitary animals such as mules and oxen. This hampered the ability of the Romans to develop a cavalry army on par with their infantry forces. Early Romans also never developed horse-based technologies of later premodern eras. The Romans never used stirrups. They also did not shoe their horses, instead relying on a temporary covering for the hoof when needed called a *hipposandal*. The lack of advanced equitation technology hampered the growth and development of the Roman cavalry arm.

The early Roman military was composed of citizens. According to ancient custom, each citizen was required to provide service to the city in times of war according to his ability. Attributed to King Servius Tullius (578–535 BCE), the Servian constitution as described by Livy 1.42–43 represents a somewhat later period in the fifth century BCE. The citizens were

divided into classes by wealth: nobles, first, second, third, fourth, and fifth. The nobles, the wealthiest class of citizens, were responsible for forming the cavalry arm of the military. Originally, these nobles formed six centuries (or approximately 600 men) of cavalry. This represented the aristocratic core of the cavalry, dating to the monarchic period. Twelve more centuries were later added. These were drawn from the social class known as *equites*; men wealthy enough to provide the equipment necessary to be cavalry but not of noble families. All cavalymen provided their own arms and armor, but were awarded a horse by the state for the duration of their service. Because of this they were called *equites equo publico* (horsemen using communally provided horses). They also received special consideration in terms of service. They were paid three times the daily rate of an infantryman, and were only required to serve 10 campaigns instead of the infantry's 16.

The cavalry section of the Republican Roman military was always small and it provided a limited service in actual combat. It was used to protect the flanks of the infantry while on the march. The army also used the cavalry as scouts, as skirmishers in small confrontations (performed by light infantry called *velites*), to maintain communications, and to forage or gather supplies from the local inhabitants for the main bulk of troops. During a battle, the cavalry was formed into two wings (called *alae*) on the sides of the main infantry body to cover the flanks of the main body or, if needed, attack the flanks of the enemy. The main goal of the Roman cavalry during battle was to neutralize any enemy cavalry if possible, and attack the enemy from the sides and rear, breaking up enemy formations and causing the enemy soldiers to panic.

Republican Roman cavalry were equipped much like their infantry counterparts. Each man was required to provide his own armor which was either chainmail or scale, a helmet, greaves (lower leg guards), a sword, spear, and shield. The cavalry arms and shield were all slightly different from the infantry versions. The spear (*hasta*) was a thrusting spear between four and six feet long with a heavy barbed point. The sword (*spatha*) was longer than the infantry *gladius*, had a heavier blade which would crush armor, and a rounded tip to prevent the cavalryman from injuring himself or his horse. The cavalry shield was round for easier use on horseback and only covered the trooper from shoulder to waist.

The tactics most commonly used by Roman cavalry was that utilized by most heavy cavalry units: the massed charge. This worked well against the

flanks and rears of enemy formations as these areas were very weakly defended. It also worked well against other European cavalry units that tended to fight in massed groups since the Roman cavalry was usually more heavily armed and armored than their opponents. The Roman cavalry was less effective when faced with light cavalry units. These types of units (such as the Numidian cavalry used by Hannibal) did not fight in dense formations. They also tended to be faster than the Roman cavalry since their horses carried less weight (light cavalymen wore lighter or even no armor). However, in general Roman cavalry was considered to be very good, although it was decidedly ineffective against elephants (encountered in the wars with Pyrrhus and Hannibal) as horses proved to be terrified of them.

Roman Republican cavalry was at a decided disadvantage, as was most cavalry of the day, when charging the front of an infantry unit in dense formation. Horses will not normally charge a solid object such as a shield wall. If the enemy formation does not break up (usually caused by the men running away due to fear), the cavalry most likely stopped its attack with little to no effect. Such unsuccessful attacks can tire the horses and put the cavalry at a serious disadvantage when called upon to perform other actions during the same battle.

As the Roman army increased in size with the expansion of the republic, the numbers of cavalry units also increased. Since the cavalry was recruited from the aristocracy, which also supplied the officers for the infantry and the army in general, a shortage of men available for service in the cavalry caused the Romans to change service requirements. As the divisions between patrician and plebeian began to weaken in the fifth century BCE, the cavalry was opened to the first class of plebeians, which had been restricted to the infantry to this point. These plebeian cavalymen (called *equites equo privato* because they provided their own horse instead of receiving one from the state) were not given the same privileges as the noble cavalry (their pay and terms of service remained equal to that of the infantry). When this proved to still be insufficient, the Roman government began to shift the responsibility of raising cavalry from the Roman citizen population to non-Roman conquered and allied peoples. By the Second Punic War (218–201 BCE), the majority of the republican-era cavalry had become *equites equo privato*. By the time of Caesar's campaigns in Gaul, the Roman cavalry was composed almost entirely of non-Romans, usually from tribes, such as the *Belgae* in northern Europe (in current Belgium), which had a history and

culture of horsemen.

Over this same period, the order of *equites* or equestrian order differentiated and diverged from the archaic Roman cavalry, becoming a relatively large group of well-to-do landowners and businessmen who intermarried with the senatorial order and who might have little to do with cavalry service.

Celtiberians

Between the tenth and sixth centuries BCE, Celts crossed the Pyrenees into Spain and settled and adopted the native Iberian way of life. They brought with them language, religious traditions and customs of warfare and amalgamated them with the Iberians' more developed urbanized systems. This fusion resulted in the, often misused, term "Celtiberian" which Graeco-Roman historians used to describe the tribes that inhabited the north-eastern-central region of Spain.

The Celtiberians controlled their boundaries, which were centered on hill-forts known as *oppida*. The tribes included: the Titti, the Belli, the Lusones, the Berones, and perhaps the most powerful of them, the Arevaci. The construction of their forts and their weapons, particularly their double-edged sword (later to be used by the Romans), suggests a warlike culture.

Each tribe was headed by a chieftain who exercised supreme martial, political, and religious control. In times of war, alliances were established against familiar opponents with designated war leaders chosen for gallantry in conflicts. Indeed, the Celtiberians had a reputation for being the finest mercenary troops in western Europe and were employed because of their hit-and-run tactics, surprise attacks, night raids and guerilla strategies. The Carthaginian armies often used their services, particularly in the Second Punic War (218–201 BCE) and they formed part of Hannibal's invasion army of Italy (218).

When the Romans expelled the Carthaginians from Spain in 206 and began the process of pacification, the greatest defiance came from the Celtiberians. Known as the Celtiberian or Numantine Wars, they lasted from 153 to 133. The first of these involved the Lusones who revolted after their territory had been reduced. It lasted until 179 BCE when the consul Quintus Fulvius Flaccus was dispatched to curb it. The most memorable resistance came when the Romans attempted to capture the chief Celtiberian stronghold of Numantia (143–133). They failed to subdue it on numerous occasions due to the tenacity of the natives, and Scipio Aemilianus only suppressed it through starvation in 133.

By the first century BCE, Celtiberian resistance had begun to decline. It is only during the Sertorian War (80–71), which formed part of the Marian-Sullan conflict, that further opposition to Roman domination is attested. Indeed, Celtiberian tribes formed alliances between both camps. Sertorius, who had won the respect of the Arevaci, utilized them against Rome and neighboring Spanish tribes who were hostile to him. Nevertheless, many of their towns had been destroyed by the end of the war, which is generally considered to mark the cessation of the Celtiberian threat. By the end of the first century BCE the Romanization of Spain had begun and Celtiberian independence had ceased.

The Celtiberians can be seen as perhaps the most superior bellicose culture among the Celts of Spain. They forcefully defended their territories and people against the Roman conquest and were fundamental in protracting the war in Spain for close to 200 years.

Censors and Census

The Roman census was a thorough evaluation of each adult male Roman citizen's property and lifestyle. According to Roman tradition, the kings, and then the consuls performed the census. In 443 BCE, the new specialized office of censor was created to relieve the consuls of this burden. By the middle republic, two censors were elected every five years for a term of 18 months, and the office became the pinnacle of a successful public career, held subsequent to the consulship. Censors inquired into men's livelihood and wealth, which determined the position of each male citizen in the *comitia centuriata* voting assembly (notionally a military assembly), and in the legions. At least by the era of the Punic Wars, the census classes ceased to map directly onto military organization, except for the minimum property requirement for legionary service.

The Roman censors' famed scrutiny of public and private morals struck some outside observers as excessive and invasive. If both censors agreed that an individual led an immoral life, the censors placed a literal black mark beside that person's name on the list of all citizens they compiled. Immorality might feature improper sexual behavior, but more damning was

financial extravagance, which diminished a citizen's property qualification, disarranging the timocratic organization of the state.

The censors enrolled new citizens into one of the traditional 35 voting tribes, and managed the Senate's membership. They also supervised Rome's budget, rented out public land, and took bids on major state contracts (most famously, for tax farming in Roman provinces). Censors therefore had a major impact on Roman public life. The office and its responsibilities fell into disuse amid the disorders of the late republic, but the emperors partially revived and performed the censors' duties.

Smaller-scale censuses occurred in the Roman imperial provinces, sometimes controversially (notably Judaea in 6 CE), and typically for the purpose of determining optimal taxation arrangements.

The republican census figures themselves, recorded by literary authors, have sustained extended modern scholarly debate upon their interpretation and the significance for mid- and late republican manpower and demography. Not enough is known about how the republican censors administered the census. The only province from which documentary census records survive in detail is imperial Roman Egypt.

Centuria, Century. See Legion, Organization of

Centurion (Imperial)

Imperial centurions were the immediate superior officers of the rank and file soldiers, and were responsible for the command of centuries in battle, where they fought close to the front. They enjoyed considerable prospects of promotion, and their careers ranged widely over the empire. Centurions were also the Roman officers with whom the civilian population was probably most familiar.

The main responsibility of the centurion was the supervision of the men under his command. Centurions were the most immediate authority figures in the daily lives of the soldiers. As the primary enforcers of military discipline, it is not surprising that some centurions aroused the enmity of the troops. The mutineers of 14 CE were particularly violent against centurions who, they believed, were unnecessarily harsh in maintaining discipline. The Pannonian mutineers executed a centurion who bore the nickname *cedo alteram* on account of his habit of calling for another stick when he had broken the first on a soldier's back (Tacitus, *Annals* 1.23). The German legions attempted to give every centurion 60 lashes, one for each of their number in a legion (Tacitus, *Annals* 1.32).

Monument of centurion. Marcus Caelius died in the Battle of the Teutoburg Forest, one of Rome's worst military disasters (9 CE). Caelius holds a short staff, a Roman centurion's badge of office, also used to punish recalcitrant soldiers. *CIL* XIII 8648 = *ILS* 2244, located in the Rheinisches-Landesmuseum, Bonn, Germany. (Alfredo Dagli Orti/The Art Archive/Corbis)

The authority and leadership of the centurions extended onto the battlefield. Since the surviving evidence suggests that, at a tactical level, individual cohorts lacked an overall commander, it is likely that the centuries were commanded by their centurions as individual combat units. The prevailing opinion of modern scholars is that centurions fought in the front rank during battle (Goldsworthy 1996:182). This assumption is made on the basis of the high mortality rate of centurions in combat which suggests that the centurions were present in the very forefront of the action. But there may be other reasons for the high mortality rate of centurions. An individual fighting in the front rank of the army was incapable of any command function, literally fighting for his life and unable to give orders.

For him to exercise control of the century, the centurion would need to separate himself from the fighting while remaining close enough to observe what was happening and make on the spot command decisions.

Assuming that cohorts were usually deployed in three ranks, centurions may have stood in the second rank and their high casualty rate can be explained by their consequent role in battle. It is plausible that high numbers of centurions were killed during moments of crisis on the battlefield, when they tried to physically hold the army together. If they survived, centurions might be handsomely rewarded for courage. A funerary epitaph for a *primus pilus* records that he received 75,000 sesterces and a promotion from Caracalla for his bravery in battle against the Carpi (ILS 7178). This indicates the importance of prowess in battle for the centurionate as a whole as a means of obtaining rewards and promotions.

Promotion into the legionary centurionate involved a substantial pay increase. After Augustus' military reforms, centurions in cohorts II–X received a salary of 13,500 sesterces. Centurions in the first cohort earned 27,000 sesterces and a *primus pilus* earned 54,000 sesterces. Membership of the *primi ordines* also guaranteed a far better standard of accommodation than that enjoyed by other centurions. The accommodation provided for the centurions of the first cohort in most legionary forts was double the size of the housing used by the other centurions and often included a courtyard. Unlike the rank and file before the Severan period, it seems likely that centurions were able to legally marry.

The advantages of a career as a legionary centurion are attested by the number of equestrians who gained commissions directly into the centurionate rather than pursuing a military career within their own order. A number of equestrian officers even transferred into the centurionate after beginning an equestrian military career path.

The geographical origins of legionary centurions varied over the imperial period. During the first century CE, there was a clear distinction between the centurions of the western and eastern legions, in particular between the Greek speaking east, Egypt, and Africa and elsewhere in the empire. Centurions from legions based in the western provinces who were involved in campaigns in the east invariably returned to their original legions on the cessation of hostilities. From the reign of Trajan onward, the transfer of centurions between legions in the east and west was facilitated and the geographical separation ceased to exist.

From the early second century CE onward, the centurionate across the empire became a remarkably heterogeneous body. This diversity was fostered by the variety of routes by which men entered the centurionate. Italians were present in small numbers in both the legions and the centurionate and there is no evidence to suggest that they were ever deliberately excluded from the army. However, the better pay and privileges available to members of the Praetorian Guard presumably tempted most Italian recruits to seek a post in the Rome cohorts. If their career progressed satisfactorily, such men could then be transferred into the legionary centurionate. Equestrians commissioned as centurions came from a variety of Italian and provincial backgrounds. It is only to be expected that the majority of centurions who began their military careers in the ranks would share the provincial background of their men, particularly as recruitment became more localized. However, the prevalence of multiple centurionate careers ensured that, although a centurion may have shared a common background with the soldiers of the legion in which he was first promoted, he could be transferred through a number of legions in different provinces.

As an illustration of the social gulf between the Roman senatorial aristocracy and centurions, Pliny the Younger relates that the wife of a (senatorial) *tribunus laticlavus* “disgraced herself and her family” by an affair with a centurion (*Letters* 6.31.4–6). To senatorial aristocrats, centurions (those who rose from the ranks) were lowly. From the perspective of common soldiers and of imperial society below the elite, centurions were men of considerable importance and social standing. This is displayed by the centurion’s words in Matthew 8:9: “For I myself am a man under authority, with soldiers under me. I tell this one, ‘Go,’ and he goes; and that one, ‘Come,’ and he comes. I say to my servant, ‘Do this,’ and he does it.”

For many of the average inhabitants of the empire, the figure of the centurion represented the Roman imperial administration which governed their lives. The Icenian revolt in Britain was, in part, provoked by the ruthless depredations of centurions (Tacitus, *Annals* 14.31). Certain regions of Roman Britain were placed directly under the control of a *centurio regionarius* (RIB 152). Papyri from Roman Egypt show that this district centurion acted as a local deputy of the imperial administration, and even as a police inspector, receiving and at least forwarding and possibly investigating petitions that reported crimes.

Centurion (Republic)

During the Roman Republic, centurions were the class of officers who commanded individual subunits of a legion. They provided both small unit leadership and communication between the legionaries and the senior officer class above them, the military tribunes. In the early and middle republic, centurions were ranked according to the century and maniple that they commanded, and in turn to the seniority of that maniple in the Roman line—the *triarii* were senior to the *principes* that were senior to the *hastati*. Each maniple was made up of two centuries, and each century had two officers attached to it: the centurion who commanded from the front, and the second-in-command called the *optio* who stayed near the rear to discourage the legionaries from fleeing. The highest ranking centurion in the legion was thus the "first spear" (*primus pilus*) centurion of the first century of the *triarii*, which was always stationed on the far right of the fighting line. The *primus pilus* of each legion was a man of considerable experience, and was a member of the commander's *consilium*, or war council.

In the late republic, the standard fighting unit of the army became the cohort, made up of six centuries, which represented three maniples of the old army organization with the addition of a portion of the light-armed infantry, the *velites*. The new rankings of the centurions, which continued to be used into the empire, reflect this origin. Each cohort had six centurions,

whose ranking differed from the centurions and *optiones* of the maniples, which were now known as *prior* and *posterior*. The senior centurion in overall command of the cohort was called the *pilus prior*; however, requiring the interpretation of inscriptions, the precise order of the ranks below this position is controversial. The options are (1) that the *pilus prior* was followed in order of seniority by the *princeps prior*, the *hastatus prior*, the *pilus posterior*, the *princeps posterior*, and lastly the *hastatus posterior*, or (2) that the order was *pilus prior*, *pilus posterior*, *princeps prior*, *princeps posterior*, *hastatus prior*, *hastatus posterior*. As before, the first cohort ranked higher than the second, and so the six centurions of the first cohort were the most senior. They were collectively known as the *primi ordines*, or “first ranks,” and they were all members of the council of war. The *primus pilus* of the first cohort of each legion was placed in charge of the legionary eagle introduced in the early first century by Gaius Marius. This standard was of great significance and its loss could lead to severe punishment of both the centurion and his men.

The normal duties of a centurion were training recruits, distributing tasks, and drilling soldiers. When a Roman army was in the field, the centurions supervised most day-to-day activities, such as entrenchment and stockading during the construction of camps. Often it was an experienced centurion who had been sent to choose the appropriate site. The *primus pilus* was responsible for making sure that a trumpet signaled the change of the watch. It was the job of the centurions to disseminate orders and messages from the commander and tribunes down through the ranks. The senior centurions also accompanied their commander when discussing terms with the enemy and were responsible for giving good advice about tactics and strategy in war councils. In battle, the centurion was not only required to direct his soldiers but also to be an example for them, often leading from the front.

In the early and middle republic before the amalgamation of the three lines into the cohort, the centurion was armed with the same equipment as his legionaries, throwing spears if commanding *hastati* or *principes*, and a thrusting spear if *triarii*. In the very early period, he carried a Greek style sword made for slashing, and in later eras the ubiquitous *gladius*, a thrusting sword which originated in Spain. A centurion was distinguished by wearing his *gladius* on the left side of his belt; legionaries carried their swords on the right side. The *gladii* carried by centurions were longer than

those of the legionaries. Centurions are depicted with small hoplite type shields until the first century BCE when they adopted the rectangular shield known as the *scutum*. Perhaps the most famous and distinctive sign of a centurion's rank was his transverse crest, a crest set crosswise over the top of the helmet. This provided a visual cue for the legionaries to recognize him in battle. The symbol of a centurion's authority was the vine-staff, with which he could inflict corporal punishment on citizen soldiers.

In early periods, centurions could be elected, appointed by the Senate, or promoted from the ranks for military bravery, but by the late republic promotion from the ranks was the commonest means of becoming a centurion. During the third and second centuries BCE, the centurion was the very image of the stalwart, skilled, veteran soldier. Polybius describes the type of man necessary for such a job as less showy than steady, and less inclined to adventure than to steely determination: the ideal centurion would die in defense of his post. By the first century BCE, the image of centurions had evolved into bold and competitive leaders, such as Caesar's famous Vorenus and Pullo from the Gallic Wars, who competed constantly to outdo each other in valor. In the late republic, the mortality rate of centurions was extraordinarily high, encouraged as they were to conspicuous acts of courage, such as being first over the wall of an enemy camp, or pushing first into the thick of battle. Caesar often portrays centurions as experienced soldiers, who can organize themselves in battle formation without orders from above.

Cerialis, Petilius (Active 60s–70s CE)

Quintus Petilius Cerialis Cassius Rufus was a Roman general of the late first century CE who is best known for his suppression of the Gallic Revolt of 70 CE. He escaped the destruction of the Legio IX Hispana during the British revolt of 60/61 CE. In 70, he was assigned the governorship of Lower Germany to put down the Gallic Revolt, completing the suppression by the end of 70. He governed Britain in 71–73/4, suppressing the revolt of the Brigantes (a tribe of northern Britain) and holding the consulship *in absentia* in 74. The main source for Cerialis is Tacitus' *Histories* and *Agricola*.

Introduction by Barbara M. Levick. London/New York: Routledge.

Christianity in the Later Roman Army

The military context of the story of Constantine I's (306–337) conversion in 312 CE introduced Christian elements to the Roman army. Most important was the *labarum*, the new Christian battle standard, topped with the *Chi-Rho* symbol. Christians viewed the *labarum* as a powerful object in its own right, protecting its bearers and able to harm and defeat enemies (particularly pagan enemies). Other features of Roman military religion were also Christianized, but ordinary soldiers seem to have been little affected for decades after Constantine's conversion. Christian theologians, for their part, had to assimilate secular military service into their worldview.

Constantine himself had a tabernacle-tent carried with his army, like Moses in the desert; other Christian practices, attributed to him, developed in the army as Christian and imperial identities came into alignment. Leave was given on Sundays for church (or a safely ambiguous monotheistic prayer for non-Christian troops). The military loyalty oath (*sacramentum*) is

attested in a Christian form by Vegetius, and by the fifth century military chaplains traveled with the armies. Evidence for permanent chapels in military bases also appears around this time. The sixth century army was completely Christian in its rites, as can be seen from Maurice's *Strategikon*, down to the Latin warcry *Deus nobiscum!* (God with us!).

Roman state religious cult had long helped consolidate military identity, and it was natural for the Christian emperors to foster their religion in the armed forces. Nonetheless, traditional religious elements did not suddenly disappear from the army in 312, and it is difficult to discern the religious convictions of ordinary soldiers. There had been some Christians in Roman armies since the late second century, though their numbers cannot be determined. Prominent commands were still held by pagans in the fifth century, and Christianization among the soldiery was slow. Christianity was a religion of the cities, while the majority of recruits were from the rural northern and western frontiers. The civil wars of the late empire do not seem to have had religious motivations, and the same soldiers served emperors of different creeds apparently without trouble. When Emperor Julian (361–363) had reverted to paganism, his soldiers were happy to feast at his grand pagan sacrifices at Antioch (Ammianus 22.12.6), but after his death went on to serve Christian emperors again. It is notable that no clear Christian symbols appear in the shield designs recorded in the *Notitia Dignitatum*, although the *Chi-Rho* appears on shields on coinage and in Justinian's Ravenna mosaic.

Objections from theologians and moralists—most notably Tertullian—outlined the disjunction between Christian and army life (the latter idolatrous and violent), but there was no unified doctrine on the subject, and Christians served in the legions despite their objections. Martyrologies report numerous Christian soldiers making a stand against serving, but many more must not have: The Tetrarchic persecutions began by purging the armies of Christians. These persecutions, in which soldiers were often the agents, must have, at least temporarily, made military service more unpopular with Christians.

Constantine's position as champion of the Church meant objections to Christian military service were undercut. Already in 314 the Synod of Arles accepted it. Although major Christian thinkers of the late Empire retained an ambiguous and uncomfortable relationship with warfare, earlier pacifistic currents now encountered more opposition. Ambrose and

Augustine in particular produced ethics and models of justified Christian warfare, based largely in traditional Roman ideas. Augustine even reversed the traditional military metaphor of spiritual warfare to encourage Boniface to prefer the army to the monastery (*Ep.*189). Even Basil, who rejected bloodshed, drew distinction explicitly between killing in war and homicide; the former found much easier atonement. Accommodation between Church and empire worked, but left the dilemma of Christian warfare largely unresolved, and it would continue to exercise church thinkers.

Christians, Persecution of

The Roman repression of the early Christians is probably the best-known Roman suppression of religion. Christians were not the only religious group Rome opposed. Bacchic cults were repressed in 186 BCE, for example, and around 300 CE Diocletian, perhaps worried over that faith's Persian origins, persecuted Manichaeism. Nor was Christian martyrdom the only model of heroic death resulting from bravely witnessing truth to power: Socrates and later Stoic philosophers died for their beliefs, as did pious Jewish traditionalists in the era of the Maccabees (160s BCE). Nevertheless,

Christianity's uncomfortable encounter with Roman power provides insight into the mentality of Christians and Romans alike.

Following Jesus of Nazareth's execution by crucifixion in 30 or 33 CE, the religious movement based on his memory would be unlawful until the conversion of Constantine in the fourth century. Ordinary Christians could normally avoid uncomfortable encounters with Roman authority. Indeed, since Christianity began as a sect of Judaism, it was not a clear target for legal repression until Romans understood basic differences between the strange, new cult versus its established parent religion. But during the first century, Judaism was itself factious and turbulent; conflicts surrounding figures like John the Baptist and Jesus, as presented in Christian sources, jibe with Flavius Josephus' detailed description of the tumultuous period. Christians stirred up opposition within traditional Jewish circles, and according to the Acts of the Apostles, the first Christian martyr, Stephen, was killed by an outraged mob of pious Jews. Aggressive proselytizing missionaries such as the apostle Paul, who preached abandonment of Jewish traditions, aggravated further discord in synagogues and houses of prayer (for instance, Acts 18; Jewish villains in later texts are fictitious topoi).

Christian missionaries fared little better among gentiles (non-Jews). Conversions to a faith that preached pacifism, separation from the world, and inversion of many social norms proved disruptive, as the novel religion divided families and seemingly undermined the traditional fabric of community religion. The growth of asceticism (renouncing bodily pleasures), especially from the second century on, led some women to reject marriage, sex, and other facets of ordinary life; this caused further social disruption in mainstream society, which prescribed women's roles as wives and mothers. Most people who heard about Christianity rejected it as an unseemly superstition that appealed to women, slaves, and social outcasts, centered on a marginal provincial subject who died as a criminal. (Indeed, Christian art avoided depicting the cross until crucifixion was no longer practiced.)

As the New Testament was taking shape in the first century, the authors of these texts took it for granted that Christian believers might face harassment, beatings, imprisonment, and possibly death. At the same time, these early Christians were already trying to carve a safer place for themselves in the Roman world by stressing their obedience to secular authority.

Many historians consider the first known incident of specific persecution to have taken place in Rome under Nero, just after the great fire of 64. Nero exploited the Christians as scapegoats because of their unpopularity, killing a multitude with theatrical mockery to distract and entertain the populace (Tacitus, *Annals* 15.44). Few details are known about the spread of Christianity after this time, but it is clear that they were becoming well known as a difficult fringe minority. Circa 112, Pliny the Younger, then governor of Bithynia in Asia Minor, sought advice from emperor Trajan on dealing with accused Christians brought before him (Plin. *Ep.* 10.96–97). Here Trajan approved of the governor's forcing Christians to recant their faith or die, but emphasized that they should not be proactively hunted out and also rejected anonymous accusations. These early sources are important for establishing a number of valuable facts.

First, although Christians were unfairly suspected of crimes and debauchery in their clandestine meetings, in fact, merely *being* Christian was illegal and provided sufficient grounds for the death penalty. To the Romans, their sheer stubbornness in refusing to pay religious respect to the gods and the Roman emperor merited execution. Roman officials generally just wanted Christians to rejoin the mainstream community, and at least take part in outward expressions of loyalty to gods and emperor when called upon to do so. Indeed, polytheists feared that the presence of Christians in their communities would cause divine wrath and punishment, and this fear seems to have prompted many of the sporadic persecutions during Christianity's first two centuries. Finally, emperor Trajan's letter to Pliny is often cited as proof that Roman authorities did not engage in "witch hunts" of Christians. This was not always the case: for instance, in 177 CE, Christians in Lyon and Vienne (neighboring cities in southern Gaul) were zealously hunted out and arrested.

A new aggressive phase of top-down, empire-wide persecutions of Christianity began when the Roman Empire was practically collapsing from economic, military, and political emergencies of the third century crisis. Late in 249 the emperor Decius (249–251) commanded everyone to sacrifice to the gods, with special written certification that they had done so. He apparently wanted divine favor and a display of religious unity; attacking Christians was not necessarily his main goal, but Decius must have known his orders would cause them problems. Decius' eventual successor Valerian (253–260) began a more ambitious persecution in the last years of the

decade, banning Christian meetings and targeting Christian leaders. These emperors' edicts were largely enforced—to the extent they were enforced—by soldiers attached to the various provincial governors. Again, most ordinary Christians could avoid trouble, and enforcement of the persecution edicts was extremely uneven. Nevertheless, state pressure was serious enough to disrupt Christian leadership and inflict serious tension within the Christian communities.

After Valerian's fall in 260, Christians had respite from state persecution. Diocletian came to power in 284 as an ambitious reformer who also sought to restabilize the Roman state on traditional religious grounds (as best he understood them). In 299, he expelled Christians from the Roman army. Early in 303, a mysterious fire in an imperial palace seems to have prompted extreme action on Diocletian's part. Christians were removed from the imperial service and other honorable professions, and clergy were systematically arrested. Churches, holy books, and other Christian property were confiscated, looted, or burned. Initially there was an effort to avoid actual bloodshed, until rumors of Christian resistance stiffened Roman resolve. There was another order for universal sacrifice to the gods, which generated a number of martyrdoms, but again actual manhunts targeted Christian leadership. Official follow-through was lax in many areas, including much of western Europe (where Constantine's father ruled as a deputy emperor or "Caesar"). Yet the overall severity of this "Great Persecution" was evident in Rome, North Africa, and many eastern areas.

Constantine's victory in the Tetrarchic civil war, and conversion to Christianity in 312 put an end to the Great Persecution in the western empire. Despite the so-called Edict of Milan, Christians in the eastern Roman Empire would not be safe until Constantine won the entire empire in 324. With one exception, subsequent rulers of Rome's empire were all Christians, and by the end of the fourth century Christianity was the state religion. Constantine's conversion did not actually end imperial persecution of Christians, unfortunately, only now the persecutors were fellow Christians aligned with state authority, and the victims were Christians deemed heretical or schismatic (see Heresies, Persecution of). The last pagan emperor, Julian the Apostate, was ironically the last of Constantine's relatives to rule (361–363). Julian pursued some anti-Christian policies, such as barring Christians from teaching, but he mainly undermined the Church by refusing to referee conflicts between bickering Christians, thus letting

them tear each other apart in dissension.

After the dust settled from the persecutions, memories of martyrs became contested territory. Some Gnostic Christians rejected the necessity of martyrdom during persecutions, while at the other extreme were Christians (e.g., north African Donatists) who rigorously avoided contact with those who had betrayed the faith. Mainstream Christianity found a middle way of honoring martyrs between these extremes, and these shifting interpretations shaped the highly imperfect source record (martyr accounts, Lactantius, and the church chronicler Eusebius). From a Roman perspective, the persecutions were obviously unsuccessful, but they reveal an important new level of ambition on the part of a government that was increasingly inclined to interfere in the lives of its subjects.

Cicero (106–43 BCE)

Marcus Tullius Cicero was a Roman senator, politician, and orator famous

for his forensic speeches and philosophical writings. Cicero is most often associated with the *optimates* or oligarchic politicians, although he was never fully accepted by them. Much is known of Cicero's life through his philosophical works, his political career, and an extensive collection of personal letters. He was born on January 3, 106 BCE and died on December 7, 43, a victim of the triumviral proscriptions.

The son of a well-to-do equestrian, Cicero began his career as a *novus homo*, "new man," meaning that none of his family had previously been senators. After distinguishing himself as a legal advocate and studying rhetoric and philosophy in Athens and Rhodes, Cicero ran for the quaestorship (75 BCE), enabling him to enter the Senate. In 70, Cicero attained his greatest fame so far as an orator by prosecuting Gaius Verres, the corrupt governor of Sicily, for extortion. In 66, Cicero supported the *Lex Manilia* empowering Pompey with a special command in Asia Minor, extending over several provinces, to campaign against Mithridates VI of Pontus. Cicero himself was elected praetor in 66.

Cicero was elected consul for 63, defeating Catiline. Catiline then allegedly spearheaded a plot to overthrow the Roman government, garnering support from all social classes, including some senators. Cicero was informed of the plot and secured summary authority over the crisis by the Senate's quick passing of a *senatus consultum ultimum*, "ultimate decree." Cicero moved quickly to apprehend those implicated in the plot, forestalling the full implementation of the Catilinarian Conspiracy. The Senate then debated the fate of the five captured conspirators. Despite Caesar's urging for clemency, Cato the Younger persuaded the Senate to vote in favor of a quick execution for the prisoners without a trial. Cicero approved Cato's sentence and executed it immediately. Cicero's action in apprehending the Catilinarian Conspiracy earned him significant public support and admiration, securing his place as the most well-regarded orator in Rome. He received the unprecedented title *Pater Patriae*, "Father of His Country," equating him with Romulus, the mythical founder of Rome. However, it is notable that accounts of the conspiracy (e.g., Sallust's *Bellum Catilinae*) are based heavily on Cicero's own *Catilinarian Orations*. Because Cicero was the chief opponent of the plot and received credit for its defeat, Cicero's account is probably biased, if not outright propagandized.

Bust of Marcus Tullius Cicero (106–43 BCE), the Roman statesman, orator, and philosopher. The portrait dates from the mid-first century BCE, though the bust support is modern. Located in the Capitoline Museums, Rome, Italy. (Araldo de Luca/Corbis)

Cicero, although sometimes accused of questionable political tactics for his own gain, nonetheless earned a reputation for probity. In 61 BCE Publius Clodius Pulcher, the rabble-rousing politician, faced trial for violating the secret female nocturnal ritual of the *Bona Dea*, the “Good Goddess” festival, by infiltrating them in women’s clothing. Cicero’s testimony shattered Clodius’ alibi, and although Clodius bribed his judges to acquit him, Cicero and Clodius became fierce political enemies. Cicero demonstrated this adherence to principle further in 60, when Crassus, Pompey, and Caesar invited him to a political alliance that became known as the First Triumvirate. Cicero declined the invitation. The next year (58), Clodius was

elected tribune of the plebs, presenting significant risks for Cicero, since Clodius could use the special powers of the tribunate to prosecute him. Caesar offered Cicero a position as one of his legates in Gaul, protecting Cicero from prosecution as well as physically removing him from the danger of remaining at Rome. Cicero (who did not have a military temperament) again declined. While these decisions did not make Cicero an outright enemy of Caesar, Caesar declined to aid Cicero in the future.

As tribune of the plebs, Clodius passed a law exiling any politician who executed citizens without trial. This law was a transparent attack on Cicero, who fled the city before its enactment. Clodius then passed a law officially exiling Cicero. In August 57, at the urging of Pompey and with significant popular support, a measure was passed to recall Cicero from exile. However, Cicero was expected to offer no resistance to the First Triumvirs' consolidation and expansion of their own power.

In 51, Cicero received governorship of the province of Cilicia, part of Rome's eastern frontier, at a time when Roman leadership feared invasion. Cicero did not take part in the eventual defeat of Persian forces, but repressed supposedly disloyal Cilician tribes and besieged and captured the city of Pindenissum. Such "small wars" were typical of Roman generals. Cicero set himself apart from many Roman governors by not taking financial advantage of his province, instead attempting to win the loyalty of the locals through restraint and beneficent practices. For his military efforts, Cicero petitioned the Senate for a triumph but failed to receive one, although he was given the title *imperator* for his reduction of Pindenissum.

In 49, Cicero grew alarmed at the escalating conflict between Caesar and Pompey, eventually judging that Caesar's aspirations were outside the moral and constitutional principles of Rome. While Cicero did not necessarily have personal sympathies or bonds with the optimates, he sided with them in the Caesarian-Pompeian Civil War mostly out of personal devotion to Pompey. Cicero fled Rome upon Caesar's invasion of Italy, traveling with Pompey's forces until Caesar secured victory. Cicero returned to Rome in 48 and received a full pardon from Caesar the next year.

In 44, Caesar's assassination prompted many senators and the public to look to Cicero for leadership, although he had not been involved in the plot. Cicero rallied the Senate in opposition to Mark Antony, then consul, who had established himself as the executor of Caesar's will. Octavian, Caesar's

adopted heir, soon arrived in Rome and Cicero attempted to coopt him in the cause against Antony. In a series of speeches titled the *Philippics*, Cicero attacked Antony in favor of Octavian. After Cicero urged the Senate to declare Antony a public enemy, Antony allied with Octavian and Marcus Aemilius Lepidus, forming the Second Triumvirate. The Second Triumvirs set about proscribing their enemies. Despite Octavian's reluctance, at Antony's insistence Cicero was placed on the list of the proscribed.

Although the public largely supported Cicero and was reluctant to report on his whereabouts, Antony's agents eventually captured and immediately executed Cicero as he attempted to flee to Macedonia on December 7, 43. Antony ordered Cicero's hands and head nailed to the Rostra, the public speakers' platform. Cassius Dio records that Antony's wife Fulvia pulled Cicero's famous tongue out of his severed head to publicly stab it repeatedly with a hairpin.

Cicero enjoyed a favorable reputation as a learned man of great philosophical import. As a politician, his reputation is more mixed. Despite trumpeting idealistic principles, he was often compromised as he attempted to remain at peace with his political peers. However, despite his distaste for violence, Cicero could not escape the conflict that surrounded him in the turbulent times of the late Roman Republic.

Cilicia

The southern coast of Asia Minor east of Lycia-Pamphylia and running toward the coast of Syria was known as Cilicia. The western part of Cilicia, or “Rough” Cilicia (Cilicia Tracheia), was mountainous and harbored bandits and pirates. The eastern part, “Smooth” or “Plains” Cilicia (Cilicia Pedias), was flatter and more fertile. Cilicia nominally was part of the Hellenistic Pergamene kingdom, bequeathed to Rome by Attalus of Pergamum in 133 BCE. The Romans needed to establish control over Cilicia to secure the Cilician Gates, the pass through the Taurus Mountains that led eastward to Syria.

Early in the last century of the Republic, the Romans made Cilicia Pedias into a province to campaign against the pirates who used the Cilician coast as a base, its many small harbors offering pirates refuge from pursuit (Appian, *Mith.* 92). The boundary between piracy and low-intensity resistance is vague. Pompey’s campaign against piracy in 67 BCE eliminated the Cilician pirates and enlarged the province. The mountain tribes of Tracheia continued to resist Roman rule. Cicero governed Cilicia in 51–50 BCE and campaigned against these tribes. In the late first century BCE, the Romans were content to establish client rulers in Cilicia Tracheia, but in the imperial period all of Cilicia was incorporated. The capital of Cilicia was Tarsus, the birthplace of St. Paul. Cilicia became Christianized early.

Cilicia Tracheia continued to be a source of bandits and “warlike peoples” into late antiquity. Such “warlike peoples” were recruited into Roman auxiliary forces and later *foederati*. The Byzantine emperor Zeno (474–491) hailed from Isauria, a region of the Taurus Mountains bordering on Cilicia.

Cinna (Cornelius Cinna, Lucius) (ca. 130–84 BCE)

Lucius Cornelius Cinna was a military and political figure of the late Roman Republic, closely associated with the Marian faction. Evidence for his early life is speculative, but he was born ca. 130 BCE to a patrician family and is notable for fighting in the Social War (91–87) and then the Marian-Sullan conflict (88–82) against Sulla and his followers. Cinna served as a legate in the Social War and fought against the Marsi (a central Italian people) in 89. He was elected consul four times between 87 and 84.

In 88 BCE, Sulla had marched on Rome with an army and had exiled and driven out many prominent Romans, such as Marius himself and Publius Sulpicius Rufus, who still had support there. In the treacherous arena of Roman politics at this time, Cinna's first job as consul was to remove Sulla, who had reluctantly supported him to his election. Cinna attempted to prosecute Sulla, but the nature of the charge is unknown and rather than face it, Sulla departed to fight Mithridates VI of Pontus. More importantly Cinna worked to have the Italian tribes, promised citizenship after the Social War, gained their right to that status. With Sulla temporarily out of the way, Cinna argued for their privileges. However, this was vetoed by the tribunes and in the ensuing violence in the Forum, Cinna was unlawfully removed as consul and forced out of Rome by his colleague and Sullan supporter, Gnaeus Octavius. He regrouped in the same year with Gnaeus Papirius Carbo, Quintus Sertorius and Marius to march on Rome in an attempt to seize it back. Unable to breach the City's defenses, the Cinno-Marian armies strategically positioned themselves around Rome, cut off supplies and starved it into submission. After some opposition, the Senate had no choice but to reinstate Cinna as consul.

Cinna was reelected again in 86 with Marius, but on the latter's death

that year Lucius Valerius Flaccus was appointed suffect consul with him. Historians know this period of Cinna's consulship as the *Dominatio Cinnae* in which an attempt was made to reestablish the finances drained by the Social War as well as strengthening the citizenship of Italian groups.

However, Cinna's major enemy remained Sulla and he sent Flaccus to fight Mithridates, which Sulla saw as a threat. With Flaccus soon removed in a doublecross instigated by the pro-Marian, Gaius Flavius Fimbria, Sulla negotiated a peace with Mithridates and prepared to return to Italy informing the Senate that he would punish those who caused suffering. Cinna engineered his reelection again in 85 and 84 with Carbo, due to this looming threat. He geared himself up for the fight but, unfortunately, Cinna would not be killed in battle. In the subsequent preparations, Cinna was murdered in the spring of 84 by his own troops who took offence to his rigorous standards and their refusal to go to Illyricum (mod. Albania, Croatia, and Bosnia).

Cinna's life is not well documented in the surviving evidence. But, he was important militarily and politically in the turmoil of the late Roman Republic, especially in the clash between Marius and Sulla. He lived in a world not of his own making, where supporters and enemies' advancement to the top was achieved by solicited alliances, violence and/or manipulation. His goal was no different and he perhaps used Marius in his own individual advancement. He was a pivotal character in the demise of the Roman Republic.

Cisalpine Gaul

The region of “Gaul this side of the Alps” in Italy is bounded by the Alps to the north, the Apennines and the Rubicon River to the south. The region was settled in the fourth century BCE by Celtic tribes, including the Senones, who sacked Rome in 390. When the Insubres of Cisalpine Gaul threatened to invade Italy, the Romans countered in 284, taking Mediolanum (Milan) and establishing colonies. The Boii and Insubres allied with Hannibal in the Second Punic War. In 81, Cisalpine Gaul became a Roman province and in 49, at the limits of his *imperium*, Julius Caesar crossed the Rubicon, launching Rome into civil war. Cisalpine Gaul was incorporated into Italy in 42. Cisalpine Gaul is distinct from Transalpine Gaul (Gaul across the Alps), the southernmost part of Gaul, later the province Gallia Narbonensis, and in general from continental Gaul (the area of modern France).

Cives Sine Suffragio

Cives sine suffragio were “citizens without the vote,” referring to an inferior grade of Roman citizenship, but generally connoting Italian allies enjoying good relations with Rome. They possessed all rights of a full citizen,

including *conubium* (the right to marry Roman citizens) and *commercium* (the right to trade with Romans), except for the right to vote in the assemblies in Rome. As Italian cities came under Roman control, their members could be granted this status, but they were not enrolled in the Roman tribes and thus could not vote. They provided an important source of Roman military manpower, and formed close ties with Rome. This distinction, which may have been rooted in geographical distance of some allies from Rome (making voting impractical), played a role in the Social War (91–87 BCE), since almost all these citizens sided with Rome. However, the concept of *civis sine suffragio* is somewhat disputed.

Civil Conflict (Late Republic)

The late Republic (133–31 BCE) showed a marked increase in civil conflict, or episodes of public violence short of civil war. Some of these episodes were spontaneous riots, while others were urged on by popular leaders. In other incidents, individuals were assassinated. The Roman state resorted to violence in repressing such episodes or their threat, enacting the *senatus consultum ultimum* that suspended the normal civil rights of Roman citizens. It is possible that these episodes of civil conflict eroded the spirit of cooperation that had marked the middle Republic and promoted further violence and civil warfare.

The first, and most famous, episode of civil conflict was the tribunate and death of Tiberius Sempronius Gracchus (133 BCE). Tiberius’ legislation for land redistribution to landless Roman citizens had a solidly traditional motive: to increase the recruitment of citizen soldiers by enabling them to meet the property qualification for legionary service. However, his program antagonized the wealthy (both citizens and Italians). Tiberius Gracchus also

resorted to unorthodox tactics, deposing his fellow tribune Marcus Octavius by a vote of the popular assembly and claiming the estate of King Attalus III of Pergamum, who had just died, to fund the land redistribution program. These methods caused Tiberius' opponents to accuse him of seeking *regnum* (monarchy, tyranny). Tiberius then ran for tribune for a second time, also uncustomary. In the assembly, a spontaneous riot broke out between Tiberius' supporters and his enemies, including many senators, who followed the lead of Scipio Nasica in attacking the Gracchans. Tiberius Gracchus and his followers were beaten to death with broken furniture and whatever was at hand. The death of Tiberius Gracchus was a shock to the Romans, since within the *pomerium* (sacred boundary) of the city of Rome, military activity and the carrying of weapons were forbidden.

Tiberius Gracchus' brother Gaius (tribune 123 and 122 BCE) introduced more wide-ranging legislation, including land redistribution, the repression of elite corruption, jury panels of equestrians for trying senators for extortion, and extension of Roman citizenship to the Italian allies, all policies that many of the Roman oligarchy opposed. Gaius ran for a third tribunate for 121, but lost. In 121, the Senate supported tribunes who proposed undoing some of Gaius' policies; at the popular assembly, spontaneous violence broke out between Gracchan supporters and the anti-Gracchans. The consul Lucius Opimius' attendant was killed in the riot, motivating Opimius to enact a new decree of the Senate, the *senatus consultum ultimum* or "Last Decree," which authorized the consuls or other executive magistrates to "see to it that the state came to no harm" (Cicero, *In Catilinam* 1.4, *Philippics* 8.14). The SCU enabled the magistrates to use whatever degree of violence needed to restore the public safety. In this case, the anti-Gracchans equipped a de facto army and hunted down and killed the Gracchans. When his capture was imminent, Gaius committed suicide by ordering his slave to kill him (Appian, *Civil Wars* 1.28; Plutarch, *C. Gracchus* 17). The Gracchans were treated as public enemies; their corpses were unburied and desecrated, being thrown into the Tiber. Gaius' head was cut off by anti-Gracchans who hoped to claim a reward. This brutal episode further eroded the social fabric of the Roman Republic.

Nonetheless, civil conflict did not break out again for a generation. In 100, Gaius Marius (consul in 107 and 104–100) allied with the tribune of the plebs Lucius Appuleius Saturninus, who promised land distributions for Marius' veterans and also proposed the extension of the Roman citizenship

to Italian soldiers. Saturninus imposed a clause in the bill that required all magistrates and senators to swear to uphold it; this was unwelcome to most of them, and Marius added an escape clause, “insofar as the law is valid,” to the bill. The senators and magistrates swore to uphold the bill, except for Metellus Numidicus, who refused and went into exile.

So far there had been no public violence, but feelings ran high. Saturninus ran for a successive tribunate; at the assembly, the supporters of Saturninus and his ally Glaucia beat to death a rival tribune, Lucius Memmius, and captured the Capitoline. The Senate declared the *senatus consultum ultimum* against Saturninus and Glaucia. Marius and his army reasserted order, arresting Saturninus and Glaucia and their supporters and locking them inside the Senate House as a makeshift prison. The enemies of Saturninus and Glaucia climbed onto the roof of the Senate House, removed the tiles, and stoned to death Saturninus and his followers with the tiles (Appian, *Civil Wars* 1.32).

The tribune Marcus Livius Drusus the Younger also met a violent end. Proposing the grant of citizenship to all the Italians, he met with opposition from the Senate. He was stabbed to death in a gathering inside his own house; the assassin was not identified. His death touched off the revolt of the Italian allies, the so-called Social War (91–87 BCE). The Social War was only resolved when the Roman authorities adopted the tactic of granting the citizenship to those allies who came over to their side. The Roman state then was faced with how to assimilate these new citizens. Since voting in the centuriate assembly was by property class, the wealthiest first, enrolling the new citizens *en masse* in a low census class would defuse their political influence. The tribune of the plebs Sulpicius Rufus instead proposed distributing them in geographic tribes in the popular assembly, which would give more influence to the Italians. To this proposal, Sulpicius added the rider that Marius should receive command of the Mithridatic war in Asia Minor.

Unrest broke out in the assembly between the followers of Sulpicius and Marius and their opponents. Sulla, consul in 88 and an enemy of Marius, declared an *iustitium* or suspension of public business; in the ensuing riot, Sulla fled Rome and escaped to join his army at Nola. Sulpicius’ legislation passed. Sulla then took the unprecedented measure of marching on Rome with his army, launching a short-lived civil war and thus breaching the sacred boundary of Rome. He captured the city; Marius and his supporters

fled into exile, but Sulpicius was killed. Sulla secured legislation transferring the Mithridatic command to himself, and departed with his army for the eastern Mediterranean.

The Marians then retook Rome. Marius himself, now over seventy years old, and his ally Lucius Cornelius Cinna claimed the consulship of 86, launching violent reprisals against the supporters of Sulla. Marius himself fell sick and died, but Cinna, his ally Carbo, and Marius' son continued the reprisals. When he returned with his army from Asia, Sulla marched on the city of Rome a second time, defeating the Marians at the battle of the Colline Gate (82), and made himself dictator (82–81 BCE). Sulla proceeded to proscribe his enemies, publishing lists that set prices on their heads. The Sullan proscriptions were the bloodiest period of civil conflict that the inhabitants of Rome had experienced, and permanently branded Sulla with the reputation of a tyrant. In fact, Sulla's measures as dictator "to pass laws and reform the Republic" were beneficial to the Senate, increasing its powers and discouraging the power and influence of the tribunes and the assemblies. Sulla abdicated in 81 (or 79) and died from natural causes a year or two later.

The next outbreak (or threat) of civil conflict was the Catilinarian Conspiracy of 63 BCE. It is difficult to estimate the seriousness of the Catilinarian Conspiracy, since the main sources, Cicero's *Catilinarian Orations*, exaggerate it and inflate Cicero's role (as consul in 63) in suppressing the conspiracy; Sallust's *Bellum Catilinae* is based on Cicero, though it downplays his role somewhat. Cicero persuaded the Senate to pass a *senatus consultum ultimum* against Catiline and the Catilinarians, and arrested some of the Catilinarians. The Senate voted to put the Catilinarians to death; Catiline himself escaped to Tuscany, where he joined a small army of supporters. Catiline's army was defeated in open battle near Pistoria early in the following year.

Subsequently, the tribune Publius Clodius Pulcher and his rival Titus Annius Milo gathered gangs of violent followers, recruited from the urban lower strata and organized through *collegia* (neighborhood or occupational associations). As tribune, Clodius passed a law exiling anyone who put to death Roman citizens without trial, which targeted Cicero's execution of the Catilinarians. Cicero fled into exile; the Clodians pulled down his house. Pompey's influence enabled Cicero to return from exile a short time later.

However, Milo's and Clodius' gangs so often threatened urban violence

that the consular elections for 54–53 were disturbed. The tribunes Lucilius Hirrus and Pompeius Rufus suggested that Pompey should become dictator (Appian, *Civil Wars* 2.21–3; Plutarch, *Cato Minor* 45). Instead Pompey was elected sole consul for 52. Pompey's actual alliance with the rabble-rousing tribunes, though alleged, seems unlikely. Pompey however benefited from the disturbances, for he was the most powerful figure in Roman politics, retaining his army contrary to Republican custom. Though Caesar was occupied in the years 58–50 with conquering Gaul, his successes meant that he was clearly headed for rivalry with Pompey. It can be argued that the increase in urban violence at Rome helped to kindle the late Republic's major civil wars, the Caesarian-Pompeian Civil War (49–45 BCE) and the triumviral civil war (44–31 BCE), and also a new series of proscriptions in 43 BCE.

Civil Rights

The Roman concept of civil rights was status based, distinguishing citizens from noncitizens and free persons from slaves. Noncitizens and slaves were liable to harsher punishment. During the empire, civil rights, though still based on these distinctions, increasingly differentiated those of privileged status (*honestiores*) from those of unprivileged status (*humiliores*). The

humiliores were liable to more severe punishment and exacerbated death penalties. The Christianization of the empire did not have a great effect upon this scaling of punishment.

Roman citizens had the right of *provocatio ad populum* or appeal to the Roman people, deriving from the verb *provocare* (to cry out). *Provocatio* applied to Roman citizens who were not in military service, and granted the right to a fair trial by the people against the arbitrary judgment or use of force by a magistrate. Citizens could also appeal to the tribunes of the plebs, who could provide aid (*auxilium*) against or veto the decisions of the magistrates. Noncitizens and slaves did not have these rights.

In the Classical Republic, the civil rights of Roman citizens protected them from execution. Exile was the most severe capital punishment, involving loss of Roman status (*capitis deminutio*). Noncitizens were liable to summary judgment by Roman governors in the provinces. At all times, slaves, lacking rights, were subject to extremely harsh punishment and exacerbated death penalties, such as crucifixion, as a punishment for running away or rebellion.

Citizen rights were eroded by the civil conflicts and wars of the late Republic. The *senatus consultum ultimum* (SCU), first used against Gaius Gracchus and his followers in 121 BCE, authorized the magistrates to take any action deemed necessary for the public safety, including extrajudicial executions. As consul in 63, Cicero arrested some of the Catilinarian conspirators; though Cicero sought a measure of legality by having the Senate debate on and vote on their fate, he was authorized to execute them by the SCU. Subsequently, Cicero's enemy Clodius Pulcher, a radical tribune of the plebs, passed a law making it illegal to execute Roman citizens without a public trial, forcing Cicero into exile. The influence of Pompey set aside this law and reinstated Cicero.

The rights of citizens eroded further when they were targeted as *hostes publici* (public enemies) in the proscriptions under Sulla (82–81 BCE) and the triumvirs Octavian, Mark Antony, and Lepidus (43–42). Public enemies could be killed by anyone seeking the rewards listed in the proscription lists. The civil wars erased the former distinction between *domi* (“home,” where citizens had the right of *provocatio*) and *militiae* (where they did not); those defeated in civil war were at the victor's mercy.

During the imperial period, additional distinctions of social status developed, separating the “more honorable” (*honestiores*) from the “more

lowly” (*humiliores*). Since the surviving legal writings were redacted much later (see “Codex Justinianus”), the development and precise definitions of these categories are debated by modern scholars. The *honestiores/humiliores* distinction replaced that of Roman citizen and noncitizen after Caracalla granted the Roman citizenship to all inhabitants of the empire in 212 CE.

The *honestiores* certainly included the imperial family, senators, equestrians, and decurions (town councilors), and probably veterans. Members of these groups were usually (except in cases of treason or sedition) exempt from the death penalty, undergoing exile instead. In cases of treason or sedition, convicted *honestiores* underwent a more honorable form of execution, for example, forced suicide or decapitation by the sword. The *honestiores* were also exempt from corporal punishment such as being beaten with rods. In contrast, the *humiliores* were liable to corporal punishment, sentence to hard labor in mines or quarries, torture (used to extract evidence), and exacerbated death penalties, including crucifixion, being thrown to wild beasts in the arena, or being burned alive. As a check to these brutal punishments, emperors and provincial governors could display *clementia* (mercy), and some jurists gave opinions restraining the cruelty of owners toward slaves. However, the conversion of Constantine I (306–337) to Christianity, and the Christianization of the empire, had little effect on severe penalties and exacerbated death penalties other than the banning of crucifixion.

Civil War (Marius-Sulla). See Marian-Sullan Conflict

Civil War (Pertinax-Septimius Severus) (193–197 CE)

The Roman emperor Commodus (180–192) was strangled to death in his bath on New Year's Eve, 192 CE. The City Prefect, Pertinax, perhaps had a hand in the conspiracy. Late that night the Praetorian Guard reluctantly acclaimed him emperor. Pertinax' reserved and conservative demeanor was unpopular with the praetorians. His attempts to reform and discipline the Guard added to his unpopularity. Two attempted coups to replace Pertinax as emperor failed. Yet on March 28, several hundred soldiers entered his palace and killed Pertinax after a reign of less than three months.

There was no clear successor to the throne after Pertinax' assassination. The City Prefect, Sulpicianus, attempted to buy the loyalty of the praetorians, offering a 20,000 sesterces reward to each soldier. However, Didius Julianus outbid him with an amount of 25,000 sesterces per soldier. Although the Guard proclaimed Julianus emperor, he was disliked in Rome, and his power did not extend far outside of central Italy. Much as in the civil war of 69 CE, the strong Roman generals outside of Italy did not recognize the new emperor and looked to make themselves *imperator*. Septimius Severus secured the support of Clodius Albinus in Britain by declaring him his Caesar, he styled himself as the avenger of Pertinax, and he marched his army from Pannonia and pushed toward Rome. All of Julianus' attempts to avert destruction failed, and the praetorians deserted him. He was murdered after an even shorter reign than Pertinax.

Severus became emperor June 1. He replaced the soldiers in the Praetorian Guard with his own men, executed those responsible for

Pertinax' murder, and had him deified. Severus' attention quickly turned to Pescennius Niger who had been hailed emperor in Syria. Niger had gained control of most of the eastern portion of the Roman Empire. He made Byzantium his headquarters and defeated part of Severus' army at Perinthus. Yet Severus soon arrived in the east and defeated Niger's forces near Nicaea. By early 194, Niger was retreating toward Antioch, and Severus gained the loyalty of most of Asia Minor, Egypt, and the Near East. Severus' general, Anullinus, caught up with Niger near Issus, where Alexander the Great had defeated Darius III. Niger's army was outflanked, surrounded, and decimated; he lost 20,000 men. Niger escaped the battle and fled to Antioch. He then attempted to flee to Persia. However, he was captured on the outskirts of the city and killed. By May, most of the remaining supporters of Niger had surrendered, and Severus was sole Augustus.

Only one potential rival remained to Severus' rule, Albinus in Britain. An assassination attempt against Albinus failed, and he was stripped of his rank of Caesar. Albinus immediately declared himself Augustus at the end of 195, prepared for war, and crossed into Gaul. He gained the support of much of the Gallic forces and made Lugdunum his headquarters, but he failed to gain the support of the Rhine legions. Severus reached Gaul with his army early in 197, and the two forces, equaling 150,000 men, clashed outside of Lugdunum on 19 February. Albinus had some success in the battle, routing Severus' left wing. Yet the timely charge of Severus' cavalry put the Albanians to flight. Lugdunum was sacked, and Albinus committed suicide. Severus had his body mutilated as a warning to any other potential rivals. He then purged the Senate of potential threats, executing 29 men. Severus became the unquestioned ruler of the Roman Empire.

Civil Warfare

In Roman literary tradition, *the* civil war (*Bellum Civile*) was the Caesarian-Pompeian civil war (49–45 BCE), popularized by various literary narratives dramatizing the conflict. Other major civil wars included the Social War and Marian-Sullan conflict (91–87, 88–82 BCE), the "triumviral" wars of 44–31 BCE; the War of Four Emperors (69 CE); the civil war of the later Severans (217–222 CE); the Tetrarchic civil war (306–313); the war of the sons of Constantine (337–340); and the revolt of Eugenius (392–394). The Catilinarian Conspiracy is not usually considered a civil war, though Catiline and his supporters took the field and were defeated in battle. Various usurpations, though violent and involving the army, also should probably not be regarded as civil wars. After the triumviral period, the longest period of civil warfare was the third century crisis (by convention, 235–284) with intermittent wars between the various claimants to the purple, most notably the revolt against Gallienus (268), Aurelian's "reconquest" of the empire (270–275), and Diocletian's war against Carinus (284–285). The recurrent civil wars of the fifth century CE led eventually to the disintegration of the western empire.

A number of revolts are not regarded as civil wars: the Campanian Revolt (214 BCE); the British revolt of 60–61 CE; the Jewish War (66–70 CE); the Gallic Revolt of 70 CE; and the Bar Kochba Revolt (132–135). In these cases, the rebels were regarded by the Romans as non-Roman (native) opponents.

Victory in a civil war might or might involve reprisals against the opposing side. The Marian-Sullan conflict was marked by such reprisals, as was the first stage of the triumviral wars (43–42 BCE). The reprisals included the proscription of vanquished enemy aristocrats, who were exiled on pain of death and with a price on their heads, sought by bounty hunters. In later civil wars, some victorious emperors preferred not to exact reprisals.

In contrast with civil wars in modern nations, where the opposing sides may support differing ideological regimes, the allegiances in Roman civil

wars appear to be based on personal loyalties. After the victory of one side, the desire for vengeance might motivate the vanquished to resist. If they accepted the victors' clemency, they could be easily assimilated into the new regime. The closest to an "ideological" civil war appears to be the conflict of Octavian and Antony, where Octavian and his supporters made Antony appear to be "Greek" or even "Egyptian." Roman soldiers in civil wars were thus probably not ideologically motivated; service in civil wars resulted in the redistribution of money on a large scale as troops received pay and bounties.

Rewriting of the historical narrative after one side achieved victory in a civil war was common. The opponents in armed conflicts who belong to the same nation, people, or ethnicity tend to characterize their own faction as legitimate and the opposing side as illegitimate. Victory in civil warfare often results in renaming or recharacterization of the conflict not as a revolt but as a war of liberation or the defeat of an unjust opponent or regime.

Thus, Roman victors of civil wars tended to denigrate their opponents as unjustified. After Octavian (the future emperor Augustus) defeated Mark Antony, a tradition consolidated that depicted Mark Antony as deluded and irrational, besotted by his love for Cleopatra into betraying Rome. This narrative was based on Octavian's propaganda against Antony. In his *Res Gestae*, a biographical inscription commemorating his deeds, Augustus characterized another opponent in the civil wars, Sextus Pompeius (the son of Pompey the Great) and his followers, as "pirates."

In the civil war of 69 CE, won by Vespasian (emperor 69–79), the pro-Flavian tradition depicted especially Vitellius, Vespasian's immediate predecessor, as lazy and incompetent, preferring to feast on his country estate rather than command his army. Later, Septimius Severus (emperor 193–211) fought and defeated his opponents Pescennius Niger and his former ally Clodius Albinus in an aggressive civil war; the historical tradition, favorable to the Severans, presents Albinus as deranged.

The possibility of civil war affected Roman concepts of "grand strategy," if such a term is not an anachronism. Emperors often chose to deal with an internal threat (revolt or civil war) first, and with external threats second; if emperors became preoccupied with an external threat, they risked revolt or usurpation within the empire. Scholars have counted as many as 49 separate civil wars during the later Roman Empire, from 235 to 476 (16 during the third century crisis) (Drinkwater and Lee 2015). To deal with wars on two or

more fronts, the later Roman emperors, beginning with Gallienus (260–268) reorganized the Roman army into central field cavalry forces that could move more rapidly to face threats, and more stationary frontier troops. Another response to the threat of war on multiple fronts was multiple co-emperors, whether unrelated peers or family members. Nonetheless, the many civil wars of the later Roman Empire, when added to increased external pressure, undoubtedly contributed to the weakening of the empire and the collapse of the western empire.

Civil Wars (I) (49–45 BCE), Causes

The immediate cause of the Caesarian-Pompeian civil war was Caesar’s crossing the Rubicon River, the boundary with Cisalpine Gaul and Italy, with his army. By crossing this boundary without laying down his *imperium* (right to command) and disbanding his army he committed an act of war. Longer term causes include the decreasing influence of the Roman Senate and the increasing willingness of Roman politicians to use popular support and military commands as bases for their power.

By the late 60s, Caesar, Pompey, and Crassus formed the First Triumvirate with the goal of controlling Roman politics. The collaboration

was successful, particularly for Caesar, who won the consulship of 59 BCE and continued to the governorship of the Gallic provinces. However, by the end of the 50s, Crassus had died at Carrhae in 53, the Triumvirate had collapsed, and Pompey's support for Caesar was wavering. In addition, political opposition to Caesar had polarized Roman politics, particularly over Caesar's intended candidacy for the consulship of 49. Caesar's opponents were eager for him return to Rome as a private citizen so that they could indict him for the actions of his consulship of 59, particularly his rejection of the religious omens declared by his consular colleague. Caesar, on the other hand, preferred to be allowed to run for office *in absentia*, although such an exception required special permission. Caesar's enemies persuaded the Senate to declare Caesar a public enemy, leaving him with no option but civil war, a gamble that he must have believed that he and his highly experienced legions (and the wealth plundered from Gaul) could win.

Civil Wars (I) (49–45 BCE), Course

The civil war between Caesar, Pompey, and the Pompeians, beginning with Caesar's crossing of the Rubicon in January 49 BCE and ending with the battle of Munda in spring 45, is one of Rome's most famous civil wars, and resulted in Caesar's autocratic rule as dictator, though his clemency toward his peers resulted in his assassination in 44.

While Caesar waged war in Gaul, his enemies at Rome militated against him (see Causes, below). In January 49 BCE, the Senate declared Caesar a public enemy. Caesar's allies fled to Caesar, who persuaded his army to avenge this insult, as well as illegal actions taken against his allies. In response, on January 10, 49 Caesar led his army across the Rubicon River, the boundary between Cisalpine Gaul and Italy. This was an act of war. Caesar's swift advance through Italy indicates he had planned for this possibility.

Caesar's route took him along the east coast of Italy, along a route that denied the Pompeians opportunities to recruit Pompeian veterans. Except for two legions of doubtful loyalty, the Pompeians had only inexperienced soldiers, a real disadvantage in battle against Caesar's veterans. Pompey therefore persuaded his colleagues to move southeast of Rome, leaving the route open to further recruiting while avoiding battle. Although this strategy was prudent, it struck Pompey's colleagues as cowardly.

The first major confrontation between Caesar and the Pompeians was at Corfinium, where the Pompeian Domitius was recruiting soldiers. Although Pompey, knowing that Domitius' forces could not match Caesar's, strongly encouraged him to move south with the rest of the Pompeians, Domitius chose to stay. His troops mutinied and sided with Caesar. Domitius was released and returned to Pompey, demonstrating Caesar's policy of *clementia* (clemency) toward his enemies.

Caesar and his army entered Rome with no resistance. After collecting funds from the treasury, he quickly marched north again to nearer and further Spain, provinces governed by Pompey *in absentia*. Caesar planned to deprive Pompey of access to the two veteran legions stationed there. He defeated the Pompeians, led by Gaius Afranius and Marcus Petreius, in the battle or more properly the campaign of Ilerda (August 49). By first outmaneuvering Pompey's legates and then encouraging fraternization between his and Pompey's soldiers, Caesar won control of these legions,

which he immediately disbanded. Caesar emphasizes the relative bloodlessness of this campaign.

Subsequently, both Caesar and Pompey moved their forces east, where Pompey anticipated support from his many allies there. Having landed first at Dyrrhachium, he outmaneuvered Caesar to claim the better camp for his army. Caesar's attempted circumvallation of Pompey's camp failed, with the result that his own army was cut off from resupply. Despite serious food shortages, Caesar's army managed to break through Pompey's forces. Both armies headed inland and met in early August 48 BCE near Pharsalus, a town in Thessaly. The battle of Pharsalus was the most famous battle of the civil war. Despite Pompey's superior numbers, the Pompeians were newly recruited, and their only real advantage was cavalry. Caesar's tactics and experienced soldiers won a decisive victory. Still, Caesar fought continued Pompeian resistance over the next three years.

After Pharsalus, Pompey fled to Egypt, where he was assassinated because the Ptolemaic king Ptolemy XIII had secretly decided to back Caesar instead. Caesar followed Pompey to Egypt and became embroiled in the "Alexandrine War," a local dynastic struggle. Caesar sided with Cleopatra, Ptolemy XIII's older sister and wife. Caesar brokered a short-lived agreement between the two, but due to his closeness to Cleopatra, was attacked by Ptolemy's army. Caesar was soon victorious. Installing Cleopatra VII as ruling queen, he gained control of the enormous financial resources Egypt could provide.

During this period, the surviving Pompeians regrouped and allied with Juba of Numidia. In Asia Minor, Pharnaces, son of Mithridates VI of Pontus, overran Asia Minor, taking territory held by Rome and its allies. On the way to face Pharnaces, Caesar settled matters in the Near East. After unsuccessful negotiations at Zela, a town in northern Asia Minor, Caesar fought and quickly won a decisive battle in August 47. He sent the news back to Rome with the famously short message, "I came, I saw, I conquered."

By October, Caesar returned to Rome, where he prepared for the coming campaign against the remaining Pompeians in Africa. During this period, all nine Caesarian legions garrisoned in Campania mutinied due to Caesar's failure to provide promised bonuses as well as pay and supplies. According to most sources, Caesar was able to end the mutiny by addressing his soldiers as *Quirites*, a traditional Latin term for citizens, signifying that he was discharging them from the army. The soldiers begged to be reinstated.

The truth is more complicated: promised pay and bonuses had failed to materialize. In the end, most likely four of the nine legions were disbanded, and five new legions were recruited to fill out needed numbers.

The “African War” was brief. Due to his new legions’ lack of experience, Caesar’s progress against the combined forces of Scipio and Juba was inconsistent. After retraining his troops and successfully blockading Thapsus, a fortified town held by Pompeians, Caesar was finally able to bring the other side to formal battle in April 46. Caesar’s victory was decisive, but his army’s frustration with the war manifested: his veterans attacked their own officers. These soldiers blamed the officer corps, and by extension the upper strata of Roman society, for this civil war.

While many Pompeian leaders surrendered after the defeat, several, including Labienus and two of Pompey’s sons, Gnaeus and Sextus, fled to Spain. Metellus Scipio died in a naval battle. At Utica, Cato the Younger, the moral leader of the opposition and commander of five legions, committed suicide rather than surrender to receive Caesar’s humiliating *clementia*.

Caesar returned to Rome close to the end of July 46 BCE, but soon proceeded to Spain to oversee the fighting that had arisen there between the remaining Pompeians and the few Caesarian legions. This was the so-called Spanish War. Despite successfully denying Caesar’s army winter quarters, the Pompeian commanders were soon soundly defeated in the battle of Munda (March 45), east of the modern Spanish city Cádiz. By the end of mopping-up operations, of the Pompeian commanders only Sextus Pompeius survived. He would later lead resistance against Caesar’s adopted son Octavian.

Civil Wars (I) (49–45 BCE), Consequences

Caesar was victorious in the Caesarian-Pompeian Civil War, and became virtually an autocrat, with increasing, unprecedented powers. His *clementia* toward his enemies resulted in a disaffected group of Roman aristocrats who eventually conspired against and assassinated him on the Ides of March, 15 March 44 BCE.

In April 45, after receiving news of the victory at Munda, the Senate granted Caesar numerous unprecedented honors, including the right to dedicate statues portraying him as a god. In October, Caesar celebrated a triumph for the Spanish war. Though technically this triumph was over a foreign enemy of Rome, it was understood as being over other Romans.

Caesar used his unparalleled influence to control that candidates could run for office, thus truncating any opportunity for advancement without his favor. His consolidation of his political power was paralleled by his monarchic and divine affectations. In a famous incident at the Lupercalia of February 44 BCE, he refused a crown offered to him by Mark Antony. While Caesar never actually claimed the title of king, in that month he became dictator for life.

By this point a definite conspiracy formed against Caesar. Its membership, drawn primarily from the Roman political elite, included several former supporters. The conspirators' major complaint was Caesar's destruction of the political freedom of their class. In their view, when Caesar made himself dictator for life, he established himself as a tyrant, thus overturning the tradition of collegial rule. Meanwhile Caesar planned for a major Roman campaign against the Arsacid Persian Empire (Iran).

The conspirators decided on the Senate meeting in Pompey's Theater on March 15 for the assassination. As Caesar entered the theater, Mark Antony was drawn away by a mutual friend. After Caesar sat, the conspirators

crowded around him as if they were going to ask him favors, and then stabbed him to death.

The news of Caesar's death incited rioting throughout Rome. This response allowed Mark Antony to broker a compromise with his enemies: Caesar's official acts would remain valid and the Liberators would not be prosecuted. For a brief time, this forced coalition would stand, but it was never meant to address the far more serious systemic problems in Roman government. As it turned out, the next decade and a half resulted in further civil war and the ascendancy to sole power of Octavian, Caesar's great-nephew and heir, the future emperor Augustus.

Caesar's actions by the end of 45 BCE strongly suggest that he was moving away from the traditional political organization of the Roman Republic. The authority Caesar was granted gradually removed limitations on Roman chief magistrates' extent and length of power, both ways that the political structure of the Republic controlled individual ambition.

Ultimately Caesar's loyal soldiers formed the base of his political support. His wealth also allowed him to dominate areas of influence outside formal politics, through patronage and popularity with the Roman public. He spent heavily on spectacles, as well as an extensive building program, both traditional methods of raising personal prestige while demonstrating respect for the state and state religion. Caesar also recruited the Italian elite into politics, promoting some of them into the Senate. The attention he gave these groups further alienated his senatorial colleagues.

Caesar can be seen as continuing a trend of the late Roman Republic toward greater power accumulated by one man. Once he had defeated his political enemies, he took steps that would outline the framework of early imperial power: the near-monopoly of military command, the redefinition of traditional Roman offices to legitimate personal power, the introduction of ruler cult, and new values, such as *clementia*. He failed for several reasons. Too many members of senatorial families opposed the changes Caesar had initiated, and the honors Caesar was willing to accept suggested there was no limit to his ambition.

This transition to single-man rule would not be simple. By late 44 BCE, when Octavian marched his legions against Rome, no participant was strong enough either to reestablish the institutions of the Roman Republic or to put in place another form of government. In late 42 BCE, those capable of commanding the largest armies, Mark Antony, Lepidus (*magister*

equitum when Caesar was assassinated), and Octavian joined together to govern the state. They defeated the Liberators decisively at Philippi and soon began to struggle among themselves for superiority. By 30 BCE, Octavian had eliminated all potential rivals. His command of the Roman army made it impossible to oppose him. Yet in his construction of power, Octavian followed the broad outlines Caesar had provided, though he would mask it far more ably with titles and forms familiar from the traditional Republic. Future emperors also found that their careers and reputations might depend on how they treated the Senate.

Ample evidence has survived for this period. Caesar's *Civil War* (*Bellum Civile*) is unfinished, and while it shares many of the same qualities of style as his *Gallic Wars*, is generally less trustworthy. It is politically motivated, at points distorts chronology, and ends shortly after his victory at Pharsalus. Other sources, such as the letters of Cicero, are often more reliable. Accounts of later portions of the war in Africa, Egypt, and Spain were written by Caesar's subordinates. They are of varying quality but unparalleled sources for these campaigns. The period of the civil war between Caesar and Pompey is also covered extensively in later sources: Appian's *Civil Wars*, Plutarch's *Lives* (*Caesar*, *Pompey*, *Cicero*, and others), and Suetonius' *Divus Iulius*. Idealization and dramatization mark these sources, in particular a poetic epic based on the civil war, Lucan's *Pharsalia*.

Civil Wars (II) (44–31 BCE), Causes

Although Caesar's assassins, often called the Liberators, wished to restore traditional government, long-term trends made this impossible. No other alternative was clear, as senatorial tradition was still too powerful to overcome, and no single man at that point could match Caesar's influence. In addition, the use of military force to attempt to resolve senatorial conflicts made further violence inevitable. Octavian would only be able to restore peace and stability to Rome by defeating his opponents' armies, as well as emphasizing his military control and popularity to prevent others from usurping power.

By assassinating Caesar, the Liberators hoped to restore the Republic by ridding it of a tyrant. However, they had little success in winning over the crowd to their side, making their ambitions impossible to achieve. Antony, however, as Caesar's closest ally, far more effectively won its support. A compromise was secured, that Caesar's *acta* would remain valid, and that the Liberators would not be prosecuted.

What nobody counted on was the impact of Octavian, Caesar's heir. His youth and background made him easy to underestimate. But Octavian immediately demonstrated remarkable political facility. By emphasizing his connection to Caesar, Octavian won great popular and military support. It also allowed him to exploit the desire for revenge. Throughout the triumviral wars, he emphasized his duty to avenge Caesar's death, drawing upon the loyalty of Caesar's veterans. Octavian later built a Temple of Mars Ultor (Mars the Avenger) in the name of the deified Julius Caesar.

Civil Wars (II) (44–31 BCE), Course

The assassination of Caesar on March 15, 44 BCE unleashed another period of civil warfare between Caesar's heir Octavian and Caesar's assassins, then between Octavian and his former ally Mark Antony, lasting until 31 BCE. This period is known as the "triumviral wars" from the establishment of the Second Triumvirate in 43.

After Caesar's death, the inhabitants of Rome rioted, and Brutus and Cassius, far from being welcomed as "liberators," were forced to flee for their own safety. Antony, Caesar's trusted supporter, encouraged this riot, exploiting opposition to Brutus and Cassius. By the end of 44, Antony's position weakened due to growing rivalry with Octavian and growing opposition to Antony at Rome, encouraged by Cicero's invectives against Antony, the *Philippics*. However, Antony's army, influence, and his magistracy protected him.

Brutus and Cassius both remained outside Italy and were made propraetors of Crete and Cyrene, respectively. Antony claimed the governorship of Cisalpine and Transalpine Gaul, but the governor he was to succeed, Decimus Brutus, refused to yield. Antony besieged Brutus at Mutina in north Italy. To confront Antony, the Senate awarded Octavian formal command of the legions he already led. Octavian and the new consuls, Hirtius and Pansa, fought and defeated Antony at Mutina (March/April 43). Hirtius and Pansa were killed, and Antony was declared a public enemy.

During his absence, relations between the Senate and Octavian began to

sour, with Octavian ultimately claiming the consulship after a successful march on Rome (August 43). Octavian was 19 years old, in clear violation of the traditional *cursus honorum*. In addition, Octavian ensured Antony was no longer a public enemy. Though the two would always be rivals, at this point alliance benefitted them both.

Lepidus, Caesar's *magister equitum*, joined the alliance. Unlike the first so-called triumvirate, the Second Triumvirate was formally constituted. Their powers were overwhelming: they could pass laws and try citizens without due process. Top priority was dividing territory among the three. Antony, the most powerful, took Cisalpine and Transalpine Gaul, while Lepidus received Narbonese Gaul and Spain, where he already had troops stationed. Octavian received Sardinia, Sicily, and Africa. This was less than it appeared: these provinces were actually controlled by Sextus Pompeius.

The triumvirate also needed troops and money to pay them, and like Sulla, chose proscriptions. These had a dual purpose: eliminating enemies while claiming their property. Those proscribed had no legal recourse; many were forced to flee or be killed. Notably, Cicero was proscribed in retaliation for his opposition to Antony. Proscriptions, however, did not raise enough funds and so the triumvirs gave 40 Italian towns over to their armies to plunder.

In early 42, Octavian and Antony moved east to oppose Brutus and Cassius. Lepidus remained in Italy. The triumvirs and Liberators both had massive armies, 20 or so legions on each side. There were two decisive battles three weeks apart, both near the strategically located city Philippi. In the First Battle of Philippi (October 3, 42), Brutus routed Octavian, while Antony defeated Cassius, who committed suicide before the battle ended. In the Second Battle of Philippi (October 23), Antony's victory was undeniable and Brutus likewise committed suicide.

With Brutus and Cassius gone, triumviral rivalries rose to the surface. Antony remained the most influential. In addition to his earlier provinces, Antony took Spain as well as the eastern provinces. Lepidus took Sardinia, and Octavian was tasked with raising more money and troops in Italy. Antony's visit to the eastern Mediterranean of course included Rome's ally Egypt, where he began his famous romance with Cleopatra. But by the middle of 40, he returned to Italy in response to the open hostilities between his wife, brother, and Octavian.

The triumviral land confiscations in Italy caused considerable hardship,

compounded by Sextus Pompeius' naval blockade, and made Octavian very unpopular. Lucius Antonius, consul for 41, and Fulvia took advantage of this opportunity. War broke out in the middle of 41, with Octavian eventually besieging their forces in Perugia. By spring 40, the town was plundered, with many civilian casualties. But Octavian's soldiers treated Antony's mercifully, and Lucius Antonius and Fulvia departed unharmed. Lucius Antonius died soon afterward, while illness claimed Fulvia soon after she returned to Antony in Greece.

Despite victory at Perugia, Octavian had won a reputation for ruthlessness in the proscriptions, alienating potential supporters. Sextus Pompeius' growing strength made him a tempting ally. Octavian forged a marriage tie through Scribonia, the sister of Sextus Pompeius' father-in-law. Though this marriage lasted no more than a year, it produced Octavian's only child, Julia.

In the Treaty of Brundisium (September 40), Antony and Octavian renegotiated the triumvirate, significantly without Lepidus, who had become much less important after he took no side at Perugia. The new terms reassigned the Gallic provinces (which Octavian already occupied) and Illyricum to Octavian. Antony's authority in the eastern Mediterranean was strengthened and included provisions for the invasion of the Arsacid Persian Empire. Octavian and Antony strengthened this agreement by marrying the newly widowed Antony to Octavian's sister, Octavia.

Continuing difficulties from Sextus Pompeius' blockade of Italy reduced public enthusiasm for this agreement. Octavian and Antony met again at Misenum in summer 39 to grant Pompeius control of Sardinia, Sicily, and the Peloponnese, capped with the promise of a priesthood and future consulship. But the terms also undermined continued support for Sextus Pompeius: Romans who had fled to him were permitted to return to Italy, while his veterans were given benefits equivalent to those of the triumvirs' soldiers.

Relations between Octavian, Antony, and Sextus Pompeius soon grew unstable. Pirates continued to interfere with shipping traffic to Italy. Antony delayed handing over the Peloponnese. And Octavian divorced Scribonia, choosing a new wife, Livia, who had strong connections to several powerful families of the aristocracy, especially the Claudii. Antony left Italy in 39 as the most powerful of the dynasts.

In 37, Antony and Octavian negotiated the Pact of Tarentum, Antony

agreeing to loan Octavian ships to counter Sextus Pompeius, who had stepped up his “piracy” against Octavian, and Octavian agreeing to give Antony soldiers for his Persian expedition. Octavian’s and Antony’s combined naval force defeated Sextus Pompeius at the battle of Naulochus in 36, removing the last of the Pompeians.

Octavian exploited Antony’s absence, painting Antony as a man debauched by eastern luxury. This was especially persuasive in 36 after Antony fathered a third child with Cleopatra and formally recognized his paternity of their twins. Antony appeared committed to Cleopatra rather than Roman tradition.

By this point, Antony’s Persian campaign had finally begun, but soon foundered. The Persians destroyed his baggage train, and the Armenians withdrew their heavy cavalry, which was essential for Roman success. Returning from Syria, Antony’s army suffered numerous casualties from disease and hunger. Antony remained in the eastern Mediterranean to manage affairs there.

Octavia soon brought fresh troops for Antony. This was ofcourse awkward, but any perceived slight toward Octavia could weaken ties with Octavian. Soon another scandal arose, the so-called Donations of Alexandria (34) where Antony crowned Cleopatra and their children, proclaiming Cleopatra ruler of Egypt and their children kings and queens. Octavian portrayed Antony as behaving in an un-Roman manner, disavowing his Roman family and espousing Hellenistic-style monarchy.

The final conflict broke out in 33, when the triumvirate expired and after Antony’s divorce of Octavia. Octavian gained support through his publication of Antony’s alleged will, which declared Caesarion, Caesar’s son by Cleopatra, Caesar’s true heir. Octavian caused all of Italy to swear an oath of loyalty to himself, giving him an overwhelming moral advantage.

Antony wintered his forces on the west coast of Greece. Agrippa, Octavian’s admiral, chose to attack early in the fighting season of 31 and forced Antony’s forces toward Actium. By September, Antony decided that his only chance was to break through Agrippa’s forces and return east. Although Antony and Cleopatra escaped with the Egyptian fleet and returned to Alexandria, Agrippa and Octavian captured most of their fleet in a decisive victory, the battle of Actium (September 2, 31). By midsummer of 30, Octavian arrived in Egypt. Antony’s navy surrendered without a fight, and his army folded quickly. Antony and Cleopatra both committed

suicide, Antony because he thought Cleopatra already had done so, and Cleopatra to avoid being paraded as a captive in Octavian's triumph.

Civil Wars (II) (44–31 BCE), Consequences

The consequences of the triumviral wars were nothing less than the establishment of the empire (Principate). By Actium, it was obvious that the traditional structure of the Republic was broken. But Octavian recognized that despite his popularity, he was still vulnerable to aristocratic ill will. In the coming decades, Octavian combined and modified traditional institutions to permit him to retain overall control while permitting the aristocracy to maintain sufficient prestige. In the “First Settlement” of 27 BCE, Octavian ostensibly gave up his powers, claiming to restore the governance of the Republic. However, the Senate conferred on him extended proconsular *imperium*, enabling him to override the governors of provinces with legions. Previous commanders had had extraordinary *imperium*, giving a precedent. Octavian presented himself as the leading citizen,

primus inter pares or simply *princeps*, “first among equals” rather than a dictator or an autocrat. His resignation of his powers in 27 was answered by the Senate with a number of honors, particularly the title *Augustus*, “revered,” a term with significant religious connotations. Henceforth from 27 BCE, Octavian is conventionally termed Augustus.

In fact, Augustus’ power depended on the Roman army, which he reorganized to discourage potential future rivals among the senators. Soldiers swore their oaths to him, and he personally paid their salaries, preventing senators from using the army to follow in his footsteps. As Sulla and Caesar had before him, Augustus also incorporated many Italian *eques* in the Senate, both to replenish the Senate and to build loyalty among a long-ignored class. These new senators received traditional prestige, but owed their primary loyalty to Augustus.

However, the extensive network of connections senators possessed was too important to weaken by much. The system this fueled, patronage, was a fundamental way many state activities such as public works were funded. So Octavian positioned himself and his family as the best representative of traditional values, deploying them to support existing institutions as well as entirely new structures. His promotion and funding of numerous projects and spectacles encouraged other aristocrats to follow his example. However, no other Roman could match his wealth, which gave him considerable advantages, while also allowing him to display the traditional value of modesty by his refusal to outdo others by too much.

Augustus’ solution to the problems of late Republican government managed to incorporate the practical realities of power in that period, namely, control of the military and popular appeal, while satisfying the aristocracy’s desire to retain prestige. For this reason, therefore, elections and other aspects of Roman government continued, although without any of the traditional freedoms the Liberators had hoped to restore. Successful candidates were those Augustus indicated he supported.

Stability, however, was delicate, and required adjustment at a number of points, most notably in the “Second Settlement” of 23 BCE. To satisfy both the aristocracy, resentful due to Augustus’ monopolization of the consulship, and the people, eager to keep Augustus in a visible official role, he took for himself *tribunicia potestas*, “tribunician power,” which granted the rights though not the office of a tribune of the people. He was also granted the same rank as the two regularly elected consuls of that year, and made all

other governorships formally inferior to his.

The system Augustus created was largely continued by his successors. There were significant weaknesses to Augustus' solution, particularly the matter of succession. Preparing family members for rule was understandable in Rome's patriarchal society, but went against Roman tradition. Time would demonstrate that emperors who did not have significant experience in government were ineffective. But on the whole Augustus' solution was remarkably long-lived.

Civil Wars (House of Constantine) (Fourth Century CE)

Constantine the Great (306–337 CE) had three surviving sons, Constantine II (emperor 337–340), Constantius II (r. 337–361), and Constans (r. 337–350). All three had been elevated to the rank of Caesar before Constantine's death, Constantine II in 317; Constantius II in 324; and Constans in 333. Constantine also elevated a nephew, Delmatius, to Caesar in 333. Constantine designated all three sons as Augusti (co-emperors) on his

deathbed in 337, with the hope that they would rule the empire together, Constantius II being assigned to the eastern frontier, Constantine II to the western provinces (Gaul, Spain, and Britain), and Constans to the Balkans, Italy, and Africa. Delmatius may have been intended to be a fourth Augustus. However, after their father's death Constantine's sons (in particular Constantius II) took immediate action to eliminate the collateral branch of the family to which Delmatius belonged, killing him and all the other collateral relatives except Gallus and Julian.

In 340, Constantine II invaded northern Italy, hoping to seize it from Constans, but was defeated and slain by Constans near Aquileia. Constans thus claimed to rule all the western empire, but became unpopular with his subjects and was overthrown by the usurper Magnentius in 350. Constantius II was occupied with waging war against the Persians and did not take part in his brothers' civil war. He was obliged, however, to fight the usurper Magnentius and defeated Magnentius at the battle of Mursa in 351.

Constantius II thus reigned alone from 350 to 361; however, he needed a co-emperor or Caesar in the western empire and so designated first his cousin Gallus (Caesar 351–354), then Gallus' brother Julian (Caesar 355–361). Victorious in war against the Germans in Gaul, Julian was acclaimed as Augustus by his soldiers and was prepared to begin civil war with Constantius II. Fortunately for Julian, Constantius died from disease in 361.

Civil-Military Relations

During the early Republic, Roman society developed a strong military

tradition of the citizen-soldier who volunteered for Rome's many wars. Roman expansion in the age of the Punic Wars inflicted stress on recruitment and service patterns, as did the civil wars of the late Republic. Something of the ethos of the citizen-soldier remained, and most Italians of the first century BCE had some experience of war. After Octavian (later Augustus) ended the wars by securing victory at Actium in 31 BCE, he began fundamentally changing Roman military service as part of his efforts to restabilize Roman society as a whole. By the end of his reign in 14 CE, service in the Roman army was a fulltime, specialized career with a state salary. The army consumed at least half of the state's budget. Soldiers became seen as a separate class during the imperial period, but no one should imagine them all sequestered in legionary forts on distant frontiers far from any civilian populations. Instead, civil-military relations were a vibrant, if problematic, factor in Roman imperial society.

New military bases, whether on the frontier or in the empire's interior, tended to attract considerable civilian commercial activity in the form of shops, taverns, brothels, and other services. Often these developed into permanent towns (*canabae*) adjacent to the camp. Augustus did not allow soldiers to be married (a policy which lasted until 197 CE), but many started families with local women anyway. The documentary sources show the constant worry over supplying the army from civilian resources, and the mere presence of units of soldiers, who were regularly paid in cash, brought economic development, urbanization, and a population boost to many areas. From Britain to Egypt, the army had a major social and economic impact on areas where it was stationed.

Overall, the post-Augustan army was a peace-time force during the 200 or so years of the *pax Romana* ("Roman peace"), in which most soldiers never saw combat. Rome derived active benefit from the soldiers by putting them to work in other capacities, such as policing, administration, and construction. Soldiers were increasingly seconded from their main units to man security outposts or serve a year on a governor's staff. Some out-posted soldiers received vows of thanks from civilian communities they had served in temporary policing roles. Other soldiers found themselves building roads, carrying messages, processing prisoners (including Christians amid occasional outbreaks of persecution), overseeing civilian watchtower guards, or administering mines. The Roman government had remarkably little bureaucracy during the early empire, so the state turned to the soldiery

when it needed skilled professionals to collect certain types of taxes, or staff administrative posts (*stationes*) throughout the empire.

Many—maybe most—soldiers would at some point during their careers be detached from their military units for some kind of temporary noncombat work. Some soldiers looked forward to a change of scenery, and most apparently did this service without major problems, but spreading soldiers out in this way undermined the army's combat effectiveness. Hadrian (117–138) specifically acknowledged this problem in his speech to the troops at Lambaesis, and his predecessor Trajan (98–117) had pushed back against governor Pliny the Younger's proclivity to use his staff soldiers for tasks such as guarding prisons, supporting a grain procurement mission, and providing security among civilians in vulnerable areas in his province (Bithynia-Pontus, today northern Turkey). Despite Trajan's reluctance in these cases, it is clear that soldiers were increasingly circulating throughout the provinces in the second and third centuries, which intensified contact between soldiers and civilians—often at the expense of the latter.

The frequency of detached service by soldiers opened the way for abuse of civilians, which is thoroughly attested in every type of source. Jurists condemned the rapacity of soldiers. Papyri and third-century inscriptions document how common it was for violent soldiers to rob civilians of donkeys and other valuables, fraudulently claiming they were needed for an official requisition. Novels and other literary sources practically depict soldiers as bandits, and bandits like soldiers. Christian texts express disaffection, especially toward low-ranking soldiers, and Jewish rabbis thought the mere proximity of a military patrol rendered the area impure. People had a realistic fear that soldiers would rape civilian women and boys.

Seeking legal redress against soldiers seems to have been extremely difficult. *Satire Sixteen* of the late second-century poet Juvenal describes the terrors of meeting a soldier on the streets of Rome; if you try to press charges after he beats you up, this poem claims, you will encounter a rigged process where the jury consists of his fellow soldiers. Every class of civilian seems to have feared and loathed soldiers. Responsible emperors and governors invested energy into curbing soldiers' corruption and abuse, but the problem remained.

Late antiquity brought changes. When he took Rome in 312, Constantine disbanded the enormous military-police complement that had grown up in

Rome (previously as many as 20,000 praetorians, urban cohorts, and *vigiles* had policed the million-inhabitant metropolis). Soldiers could still be found in major cities to serve the emperors' interests, but the heyday of military policing was over. So was the classic pattern of abuse. In terms of state service and administration, the distinction between civilian and military blurred in many ways as bureaucracy grew. Whereas in the early empire all legions were notionally mobile, now frontier forces (*limitanei*) settled into permanent stations; with the marriage ban lifted in 197 and the decline of old distinctions, these soldiers could integrate more easily with surrounding civilian communities.

Civis Romanus

Citizenship for the Romans consisted of a set of rights and obligations, which, unlike Greek citizenship, became divorced from physical residence, allowing Roman citizens to inhabit large areas of Italy and beyond. The basic obligations of citizenship in the Republican period were military service (*militia*) and the payment of a property tax to fund military operations (*tributum*). Citizens were liable to the census, which determined their military and tax obligations. After 167 BCE, Roman citizens no longer

had to pay this tax. They were still liable to other taxes, including the *vicesima hereditatium* introduced by Augustus (27 BCE–14 CE), which funded military pensions.

Roman citizen rights include the right to vote in elections (*suffragium*), the right to run for office (*ius honorum*), the right to engage in commercial activities under Roman law (*commercium*), and the right to marry to produce citizen offspring (*conubium*). The latter two were shared with Latins, but the right to vote in elections was confined to Roman citizens and in practice to those who lived in and near Rome. By the late Republic, due to the growing expense of canvassing for votes and providing promised amenities, running for office became the privilege of wealthy citizens.

The character of the Roman citizenship drifted with time, as seen from the change in tax obligation above. As Roman citizens settled outside Italy, their full political participation declined, since they were unlikely to travel to Rome to vote in elections. This long-term shift, as well as the promotion of Italians and provincial Roman citizens into the Senate, was a major demographic factor in the transition to the Principate. People accepted imperial rule because they no longer had a strong familial tradition of participation in traditional Republican politics.

The Republican *dilectus* (levy) also went into abeyance. The Roman army relied more and more upon volunteers, usually provincial Roman citizens, who joined the legions, and noncitizens induced to enlist in the *auxilia* by the grant of citizenship upon discharge. Recruiting became increasingly regional, near the frontiers. Citizenship thus became less and less a trait of the political participant, and more and more a reward that the Romans offered to provincials, including urban elite individuals as well as soldiers. Citizenship granted privileges in Roman law, including greater access to legal representation; noncitizens were liable to summary judgment (*cognitio extra ordinem*) by the governors. In 212 CE, the Emperor Caracalla (211–217) granted the Roman citizenship to all inhabitants of the empire except surrendered aliens (*dediticii*).

Claudius I (Emperor) (41–54 CE)

Born in 10 BCE, Claudius I (reigned 41–54), a nephew of the emperor Tiberius (14–37) and uncle of Gaius (Caligula, 37–41), achieved the conquest of Britain and the addition of other provinces to the Roman Empire. Despite his contemporaries' poor opinion of him, Claudius contributed to the rationalization of Roman imperial administration and the promotion of provincials. His reign demonstrates the symbolic role of the emperor as commander-in-chief and displays the conflict between emperor, imperial functionaries, and Senate that persisted into the third century CE.

Claudius was a scion of the Julio-Claudian imperial house; as the son of Drusus the brother of Tiberius, he was also the brother of Germanicus (d. 19 CE), who was the father of Gaius (Caligula). For these reasons, and not for his previous public distinction, the Praetorian Guard elevated Claudius as emperor upon Caligula's murder. Claudius had held few public offices or duties because of his ill health. He was disabled, probably by cerebral palsy. Though the condition did not affect his intellect, the Roman elite prized the art of oratory, which emphasized harmony in speaking, walking, and gesturing; Claudius' limp and stammer made him inadequate in these respects. Claudius occupied his earlier years writing histories of the Carthaginians and Etruscans. After his accession, Claudius rewarded the praetorians with 15,000 sesterces per man, an unprecedented sum.

Relief of Claudius subduing Britannia. The emperor Claudius (41–54 CE) is shown in heroic guise, overpowering the female personification of Britain, conquered by Claudius' generals in 43. The Romans frequently depicted conquest in such gendered terms. From the Sebasteion (temple of the imperial cult) at Aphrodisias, Turkey. (Paul Street/Alamy Stock Photo)

Claudius needed to build up his prestige with military conquest. In 42, the governor of Dalmatia, Camillus Scribonianus, revolted; Scribonianus quickly lost the support of his army and was murdered. Nonetheless, the traditional (if symbolic) role of commander-in-chief would bolster Claudius' image as emperor.

Most important was his invasion of Britain in 43 CE. Julius Caesar had

invaded Britain twice in 55 and 54, but achieved no lasting conquest beyond the establishment of client kings. Although British chieftains had earlier visited Rome to pledge their friendship, Britain still seemed extremely remote, located beyond Ocean, the great river thought to encircle the world. Claudius hoped to surpass Julius Caesar's achievements and link himself to a founder-figure of the Julian dynasty by conquering Britain permanently. In the early Principate, emperors did not fight in combat or even often take the field in person; their roles as commanders-in-chief were symbolic. The Britain campaign was commanded by Aulus Plautius; the future emperor Vespasian commanded a legion. Claudius took a more active role than usual, even traveling to Britain himself to enter the town of Camulodunum (Colchester) as a victor. Suetonius (*Claudius* 17) minimizes the campaign, and Tacitus, *Agricola* 13 emphasizes the role of Vespasian, but Cassius Dio depicts Claudius as a commander (60.21.4). Given Claudius' physical disability, Dio (abbreviated by the Byzantine author Xiphilinus) is probably attributing to Claudius the deeds of his subordinates, though it is likely Claudius received the surrender of the Britons at Camulodunum.

After celebrating his triumph over Britain at Rome in 44 CE (the first emperor to triumph in his own right since Augustus' triple triumph in 29 BCE), Claudius commemorated his invasion of Britain with the construction of a victory arch, depicted on coin issues from 46 to 50 even before it had been completed. Another arch was constructed at Gesoriacum (Boulogne), from where the troops had embarked for Britain. Claudius' son, born in 41, took the name Britannicus ("Conqueror of Britain"), and Claudius extended Rome's *pomerium*, in recognition that he had expanded the empire. Displaying the heroic stature which Claudius claimed, one of the reliefs from the Sebasteion at Aphrodisias depicts Claudius as a heroic figure subduing a personification of the province of Britannia.

Claudius' annexation of Lycia (part of Asia Minor) in 43 CE is less well known, but a series of recently discovered inscriptions show that he was celebrated there as bringing peace to a restless region. His governor Quintus Veranius oversaw an extensive road-building program that played a crucial part in the process of pacification and reorganization. This was celebrated in an impressive monument set up by the Lycians in Claudius' honor at Patara in 45/46 CE, overlooking the quayside of the ancient harbor, whose inscription gave details of the distances between at least 50 locations across Lycia.

Claudius also annexed Thrace and Noricum in 46 CE, and military operations were ongoing in Germany. Since conflict between Jews and

Greeks had arisen in Caligula's reign, Claudius imposed peace upon the Jews of Alexandria in a surviving document. The wider conflict of the Jews of Judaea with their Roman rulers continued to grow, resulting in the outbreak of the Jewish War (66–70) late in the reign of Nero. Claudius also suppressed a revolt in Mauretania. By the end of his reign, Claudius had been acclaimed *imperator* an unprecedented 27 times, showing how his image as successful military commander remained a key component in his grip on power.

Unfortunately, Claudius' conflict with the Senate was less fortunate for his reputation. He promoted his imperial freedmen as secretaries. These men's roles, in charge of imperial correspondence and finances, were very powerful and influential. Modern scholars regard Claudius as contributing to the creation of a rationalized imperial bureaucracy. However, the Senate resented the freedmen secretaries. Aristocratic sources (such as Suetonius' biography of Claudius; Tacitus' *Annals*) depict Claudius as under the thumb of his freedmen and of his wives, successively Valeria Messalina (put to death with her lover Gaius Silius for alleged conspiracy) and Agrippina the Younger, his own niece and mother of Nero. Modern historians have made extensive efforts to rehabilitate Claudius' reputation as a capable ruler.

Claudius II Gothicus (Emperor) (268–270 CE)

A Roman emperor (268–270 CE), Marcus Aurelius Claudius, was a tribune in

268 CE when he participated in the plot to murder the emperor Gallienus. Subsequently proclaimed emperor himself, he embarked on a campaign against the Alamanni in north Italy. When the empire was threatened by a Gothic invasion, Claudius took to the field again, winning a significant victory at Naissus in 269 CE, and earning the title Gothicus. He died of the plague in September 270 CE and was commemorated with a golden statue on the Capitoline hill and a shield in the Senate House. Constantine the Great (306–337) claimed that his father Constantius I was descended from Claudius II Gothicus, but there is probably no basis for this claim.

Claudius is mentioned briefly in the epitomes of Eutropius and Aurelius Victor (mid-fourth century CE). The Life of Claudius in the *Historia Augusta* is longer but highly idealized and unreliable.

Clementia

Clementia, “mercy,” became an important imperial virtue, contrasting with the Republic. In the Republic, commanders were expected to spare the enemy who formally surrendered into the power of the Romans (*deditio in fidem*). To massacre or enslave those who had surrendered *in fidem* was considered reprehensible. However, mercy or clemency became a positive virtue in the context of the late Republican civil wars and proscriptions. Julius Caesar advocated clemency toward the Catilinarian conspirators in 63 BCE and emphasized his clemency toward the Pompeians in the civil war of 49–45 BCE, not taking reprisals on his opponents. More cynically, Cicero called Caesar’s clemency “a new way of conquering” (*nova ratio vincendi*, *Letters to Atticus* 9.7C). Caesar’s opponents saw his clemency as an assertion of power over them and rejected it. Spectacularly, Cato the

Younger committed suicide rather than receive Caesar's clemency. The so-called Liberators who assassinated Caesar also repudiated the clemency he had shown toward them.

The cruelty of the triumviral proscriptions (43–42 BCE) led Augustus to emphasize his clemency, as a transformation from Octavian who had treated pleas for mercy with cold contempt. Antony and Cleopatra chose to commit suicide rather than receive *clementia*; Cleopatra allegedly said “I will not be triumphed over” (in Greek, *ou thriambeusomai*). The bad reputation of the treason trials in the early empire meant that *clementia* became one of the stock imperial virtues, best known from Seneca the Younger's *De ira* and *De clementia*, advocating *clementia* as a monarchical virtue to the young emperor Nero (54–68 CE). However, in this very period the punishments meted out to lower class subjects became more severe.

Cleopatra (69–30 BCE)

Cleopatra VII (r. 51–30 BCE) was the last reigning member of the Ptolemaic dynasty of Macedonian Greeks, who ruled Egypt from 305 to 30 BCE. She is famous for her connections to Julius Caesar and Mark Antony and her attempt to preserve the independence of Egypt from the Roman Empire. Thus she played an important role in the last stage of the civil war that brought Octavian to power as ruler of the Roman world.

Born in 69 BCE, Cleopatra was the daughter of Ptolemy XII Auletes (r.

80–58, 55–51 BCE) and an unknown Greek minor noblewoman. When Ptolemy XII died, Cleopatra married her younger brother, Ptolemy XIII (sibling marriage was a traditional Pharaonic and Ptolemaic custom), but his ministers soon overthrew her and briefly imprisoned her. She escaped, probably after suffering torture. When the defeated Pompey fled to Egypt, expecting the already deceased Ptolemy XII to protect him, the Ptolemaic general Achillas persuaded Ptolemy XIII to murder Pompey, because he was too dangerous to keep alive (Caesar, *Civil War* 3.104). When Caesar arrived in Egypt in pursuit of Pompey, he learned of Pompey's murder and the civil war between Ptolemy and Cleopatra.

Caesar ordered Ptolemy XIII and Cleopatra to submit to Roman arbitration according to the alliance with Ptolemy XII. However, Pothinus, another minister of Ptolemy XIII, refused and encouraged Achillas to attack Caesar. Caesar thereupon executed Pothinus and seized Ptolemy XIII. Cleopatra's younger sister Arsinoë then joined another general, Ganymede, and proclaimed herself queen of Egypt. Ganymede killed Achillas, and later Caesar killed Ganymede.

Cleopatra won Caesar over with her charm (according to legend, she was smuggled to him in a carpet or large sack). Ptolemy XIII died in the fighting ([Caesar], *Bell. Alex.* 31), and Arsinoë was captured (later, Arsinoë was executed at Cleopatra's request). Caesar recognized Cleopatra as queen of Egypt and made her marry her younger brother Ptolemy XIV. Caesar then departed Egypt. After his departure, Cleopatra gave birth to a boy whom she claimed was the son of Caesar, Caesarion (later Ptolemy XV). Modern scholars have speculated that Caesarion was the product of rape during her brief captivity, rather than Caesar's illegitimate son.

Despite the notorious Ptolemaic dynastic conflict, Cleopatra appears to have been a highly effective monarch of Egypt, ruling for the good of her subjects. She was a highly intelligent and well-educated woman who impressed those she met with her charm and wit, rather than with her beauty, the latter being emphasized by later, more remote sources. If Cleopatra had an affair with Caesar, as the sources concur, it was calculated to establish a favorable relationship with Rome. For his part, Caesar secured Egypt as a client monarchy providing wealth and grain for the city of Rome.

In 44, Cleopatra joined Caesar in Rome, a matter of chagrin for Cicero. Cleopatra hastily departed right after Caesar's assassination and never returned. In 42, Mark Antony ordered Cleopatra to appear in Tarsus to

apologize for assisting Brutus and Cassius before Philippi. However, Cleopatra charmed Antony with her wit (and also seduced him with a display of Egypt's wealth). Antony began an affair that lasted over a decade and fathered three children with Cleopatra. However, Antony agreed to marry Octavian's sister Octavia in the Treaty of Brundisium and never formalized his relationship with Cleopatra with marriage.

Thus, Antony appears to have attempted to play both sides—Roman commander and triumvir, and Hellenistic monarch. He gained by doing so; Cleopatra helped fund his unsuccessful invasion of Persia. In the ceremony termed the “Donations of Alexandria” in 34 BCE, Antony held a quasitriumph at Alexandria and he and Cleopatra appeared on lofty thrones, garbed as “Dionysus” and the “New Isis,” respectively. Antony proclaimed Cleopatra “Queen of Kings,” and her son Caesarion “King of Kings”; their mutual children Alexander Helios, Cleopatra Selene, and Ptolemy Philadelphus were granted the eastern empire east of the Euphrates, Cyrene, and the eastern empire west of the Euphrates respectively. The “Donations” hurt Antony's reputation at Rome. The prevailing view at Rome was that Antony's conduct was arrogant and un-Roman; many of these areas were provinces governed by Romans and not his to give away.

Octavian exploited Antony's un-Roman behavior (and his slighting of Octavia) to justify a civil war against Antony; in Octavianic propaganda, the war was depicted as a foreign war against the Egyptian queen, depicting Antony as having lost his Roman identity from infatuation with Cleopatra. War was declared in 32 BCE. In August 31 BCE, Cleopatra persuaded Antony to risk a naval battle, over the advice of his more experienced commanders, who urged him to wait or fight on land. During the battle, Cleopatra and the fleet with the treasure sailed off to Egypt, but most of Antony's fleet was destroyed or surrendered to Octavian.

Octavian's forces closed in on Egypt. Unable to resist for long, Antony committed suicide on September 1, 30 BCE, and Cleopatra surrendered to Octavian, hoping to remain a client monarch. Later realizing that she would be displayed in Caesar's triumph, she committed suicide. Plutarch says there are multiple versions of her death, but the most common is that an asp (a poisonous snake) was smuggled in on a plate of figs, the snake delivering a fatal bite. Many scholars have found this implausible and have suggested that Cleopatra took poison by the normal route or that Octavian had her

assassinated, though his attempts to revive her argue against the latter. Octavian allowed Antony and Cleopatra to be buried with traditional Egyptian and Ptolemaic pomp. He had an effigy of Cleopatra paraded in his triumph in 29 BCE.

Client.* See *Patronage

Client Monarchs

Client monarchs were rulers who had become friends and allies of the Roman people (in Latin *reges socii et amici populi Romani*). As Roman power expanded throughout the Mediterranean, the Romans came into contact with many small kingdoms. These kingdoms persisted into the early empire, as a crucial, functional piece of Roman governance. Client kings maintained kingdoms on the borders of the empire, or regions that were deemed too difficult for the Romans to rule. Under the Flavian (69–96 CE) and early second century CE emperors (98–138 CE), a policy of annexation ended this governing arrangement. Client peoples reemerged as significant in the later empire.

Client peoples might have other forms of government, such as elected magistrates (the Aedui in pre-Roman Gaul) or an oligarchy of nobles. Even in such cases, the Romans preferred to deal with the client peoples' elites as "friends and allies of the Roman people."

The memory of the sixth century BCE Roman kings framed the Roman

relationship to client kings. Due to the legend of the proud, haughty Tarquins, and the overthrow of the monarchy by Lucius Junius Brutus, the Romans prided themselves on not being subjugated to a king. Therefore, Romans disdained kings and their subjects. So powerful was this ideology that Roman emperors, 500 years later, deliberately avoided the term king, *rex*, because of its implications and used *princeps*, or first citizen instead.

Actual Roman relationships with kings were inevitably driven by Roman foreign policy. During the First Punic War, Rome found an ally in King Hiero II of Syracuse. During the Second Punic War, they used the Numidian chieftain Masinissa to weaken the Numidian kings who were allied to Carthage. Masinissa's kingdom grew, at the expense of a much weakened Carthage, eventually leading to the Third Punic War and the destruction of Carthage.

In the second-century BCE Mediterranean, Rome faced off against two powerful kingdoms, the Antigonids of Macedonia and the Seleucids of the greater Near East; both Hellenistic successor states to the empire of Alexander the Great. Against these enemies, Rome led a coalition of lesser states and kingdoms, including the client monarchies of Pergamum, Judaea, Bithynia, Cappadocia, Galatia, Pontus, and Ptolemaic Egypt. These kings provided the Romans with allied troops, logistical support, naval power, and tribute. In return, Rome helped them maintain their independence and awarded them with territory acquired at the expense of the Antigonids and the Seleucids.

The Romans had certain expectations for these kings. They had to follow Roman foreign policy and not make war without Roman permission. They provided regular gifts to the Roman people, and they were clients of powerful Roman aristocrats. They were required to provide military support to Roman magistrates. For example, when Cicero was governor of Cilicia in 51–50 BCE, he called in King Deiotarus of Galatia's forces to help him.

Roman expansion in the Mediterranean, following the collapse of the Antigonids and Seleucids, led to the creation of provinces under Roman rule. Many of these provinces expanded at the expense of the client kingdoms. The kingdom of Pergamum, following the death of Attalus III in 133 BCE, was deeded to the Romans in his will, creating the province of Asia. The great eastern command of Pompey from 66 to 61 BCE brought more client kings under direct Roman supervision.

From this period on, the client kings became pawns in the Roman civil

wars. Juba I of Numidia fought with Cato the Younger and Metellus Scipio against the forces of Caesar in North Africa. The famous King Herod of Judaea acquired his power from the Roman Senate in 40 BCE. To aid her lover Mark Antony, Cleopatra provided him with troops to fight Octavian. Throughout these civil wars, the client kings served as supporters of the most immediate power.

Following the victory of Augustus at Actium in 31 BCE, the Roman Empire was reorganized. Much territory in the empire was placed under the government of client kings. In the Near East, client kingdoms were numerous, with Judaea, Nabataea, Commagene, Galatia, and Armenia under the rule of client monarchs. Egypt passed under Roman rule following Actium and was governed by an equestrian prefect who answered directly to the emperor. These client kingdoms were integrated into a broader system of Roman rule. The governors of imperial provinces (garrisoned with legions) exercised oversight over the nearby client kingdoms.

Client monarchs in the imperial period were far more integrated into the imperial system. Succession was not automatic; the heirs of a deceased client king had to travel to Rome to be confirmed by the emperor. Client kings also engaged in euergetism, providing benefactions to cities throughout the empire. Herod of Judaea was particularly notorious for this, but he also served as the patron and defender of Jewish communities throughout the Roman Empire. Kings also made their allegiance to the Roman imperial family well known. Herod founded the city of Caesarea on the coast of Judaea, with a temple of Roma and of Augustus. Many client kings ruled over sparsely settled areas, often on the periphery of the Roman Empire, that would be difficult for the Romans to govern, such as Trachonitis or Batanea, mountainous regions full of bandits in southern Syria. Kings also trained their troops in Roman style; such troops might be incorporated into the Roman army. For example, the army of King Deiotarus of Galatia persisted long after his kingdom was annexed, becoming the Legio XXII Deiotariana.

By the Flavian period, many of these kings had been removed from power. Galatia and Judaea had been absorbed into the empire and turned into normal provinces. Commagene had also been annexed by the Romans because of the intrigues of its rulers in 72. In 106, during the rule of Trajan, Nabataea was annexed. By the Antonine period, kings were far less crucial

to the Roman imperial system; emperors preferred direct governance by Roman governors. Institutionally, this led to standardized Roman rule, ending royal privileges and creating a more coherent Roman imperial structure.

The late fourth and fifth centuries CE saw a reversion to alliances with client peoples and their leaders, such as the Visigoths, Burgundians, and Huns. Rather than being kept beyond its borders, these peoples were allowed to settle within the empire, eventually leading to the fragmentation of the western empire.

Clodius Albinus (Usurper) (d. 197 CE)

Roman emperor (195–197 CE). Decimus Clodius Septimius Albinus, governor of Britain, was one of four senators who claimed the imperial power following the murder of Pertinax in 193 CE. One of his rivals, Septimius Severus, offered Albinus the junior post of Caesar, which he accepted. But after Severus defeated another claimant, Pescennius Niger, he had Albinus declared a public enemy. Albinus' forces in Gaul were initially successful in holding back Severus' troops, though he suffered losses at the hands of a local Gallic militia. However, Severus won the day at the battle of Lugdunum (Lyons) in February 197 CE. Albinus was killed and his supporters executed.

Cassius Dio's *Roman History* and Herodian's *History of Rome* (from 180 to 238) narrate the civil war. The *Historia Augusta's* Life of Clodius Albinus is highly unreliable.

Clodius Pulcher (d. 52 BCE)

A *popularis* or “people’s man” who sought betterment for the urban plebs of Rome, Publius Clodius Pulcher is best known for his unscrupulous and violent political methods, exploiting the office of tribune of the plebs in the chaotic conditions of the late Republic. Clodius was born in 92 BCE to a notable patrician family. Clodius was rumored to have had an incestuous relationship with one of his sisters, who was married to Lucius Licinius Lucullus. Clodius served with Lucullus in the Mithridatic Wars and sparked a mutiny among Lucullus’ soldiers.

In 61 BCE, Clodius caused a scandal during the *Bona Dea* or “Good Goddess” festival. Julius Caesar’s wife, Pompeia, hosted the festival, a religious rite exclusive to women. During the ceremony Clodius dressed as a woman to gain entrance to the premises and supposedly entertain an affair with Pompeia. He was caught by an attendant and quickly placed on trial. Cicero bore witness against him, while Caesar, who had divorced his wife over the incident, chose not to testify. Clodius was acquitted of the charge, largely due to support from the people, possible bribery and threats of mob violence.

In 59 BCE, with the aid of Caesar, Clodius transferred to plebeian status to become eligible for the office of tribune of the plebs. As tribune in 58, he instituted a number of popular reforms, most notably free grain distribution and reinstitution of *collegia*, “associations.” Clodius drove Cicero out of Rome by enacting a law punishing anyone who sought to execute Roman citizens without a trial. This law targeted Cicero, who, during the Catilinarian conspiracy, had ordered the summary execution of some of the conspirators.

Clodius attacked his former ally Pompey, challenging the arrangements Pompey had made while on campaign in the eastern Mediterranean.

Pompey was assisted against Clodius by Titus Annius Milo. Both Milo and Clodius incited large gangs of followers against each other. These gangs turned violent, wounding and killing many. Clodius then attained the aedileship for 56 BCE. He continued to viciously attack Milo.

In 52 BCE, Milo's and Clodius' gangs engaged in a riot during which Clodius was killed. This caused an uproar among the people. His body was taken to the rostrum and displayed, throwing the populace into a frenzy. His body was carried to the Senate House, where it was placed on a makeshift pyre and the entire building was burned down. Milo was later prosecuted for the murder.

Clodius is sometimes regarded as a pawn of larger figures such as Caesar; however, recent historiography has seen Clodius as a far more independent agent. He seems to have genuinely sought reforms favoring the people of Rome, in addition to his own political advancement, primarily through use and threat of violence.

Codex Justinianus

The Codex Justinianus, or Code of Justinian, is a part of the massive project undertaken by the emperor Justinian (527–565) to comprehensively publish and regularize the body of Roman law. Carried out by a team of Justinian's legal advisers, the result was what has become known as the Corpus Juris Civilis or Civil Law which consists of Justinian's Code, the Digest, the Institutes, and the later Novels.

By the sixth century an enormous body of Roman law, dating back as far as the Roman Republic, complicated Roman jurisprudence. Despite earlier codifications such as the Theodosian Code of the fifth century, problems persisted. Nearly a century of additional legislation had accreted since the earlier codes had collected imperial enactments, or constitutions, from the reign of Hadrian through Theodosius II. The first edition of the Code of Justinian appeared in 529 CE and was revised in 534 CE. The Code harmonized and updated the earlier works and included more recent legislation.

However, Justinian's project went well beyond that of his predecessors. Tribonian, the *quaestor sacri palatii*, or senior law minister, also chaired a commission which compiled and edited the writings of the earlier important jurists of Roman law from the first through the fourth centuries into the Digest. These jurisconsults had legal standing and could be cited in court, but at over 1,500 books of opinions by various authors confusion often prevailed. Tribonian and his colleagues condensed this mass of material into a mere 50 books that Justinian promulgated in 533 CE. Henceforth, the redacted opinions of the jurists in the Digest were to have the force of imperial enactments in their own right, but no new independent legal commentaries were to be permitted. The emperor himself was to be the sole maker and interpreter of the laws. Concurrent with the Digest, Justinian also promulgated a new textbook, the Institutes, which was to be the cornerstone of the first year of legal education.

Justinian had planned to promulgate his Novels, or new enactments that post dated his Code, in an official collection. This plan ultimately did not come to fruition, but they have come down to us in unofficial compilations.

Although the Code, Digest, and Institutes were written in Latin, the traditional language of the Roman administration, the Novels were generally composed in Greek, the language of the eastern empire.

Despite the seemingly traditional nature of much of the material contained in the Code and the Digest, a degree of caution is warranted. The process by which earlier legal materials were brought into conformity with one another sometimes went beyond simple excerpting and epitomizing. On occasion, Justinian's men engaged in outright alteration, known as interpolation, although the extent of such interpolation is a matter of some debate.

In addition, the degree to which the codification supported the ideology of Justinian's regime should be taken into account. Even the pagan legislation that was included now received a Christian gloss through references to the divine providence in various constitutions as well as the prologue of the Digest. Likewise the person of the emperor received special reference as the source of all legislation. First year law students were now to be known as *Justiniani novi*, "new Justinians," and in a novel of 537 the emperor could even go so far as to refer to himself as *nomos empsychos*, "incarnate law."

The influence of the Corpus Iuris Civilis on modern European civil law has been immense, especially in continental Europe.

Codex Theodosianus

The Codex Theodosianus or the Theodosian Code is a collection of over 2500 imperial constitutions from the reign of Constantine I to Theodosius II (313–437). The code is written in Latin and is arranged under 16 titles according

to topic, and the constitutions are in chronological order. This is not a complete record of all the constitutions from the empire in this time period, since the commissioners were unable to find all these constitutions. Justinian's later collection, the Digest, contains many constitutions that were not in the Theodosian Code.

The Code served as a major legal codification project, supplementing earlier collections from the time of Diocletian, the *Codex Gregorianus* and the *Codex Hermogenianus*. The three were intended to be a comprehensive guide to Roman law. This codification served an important function, since Roman law had grown extensively during the empire. Since the emperor's decisions had the force of law, there were two main ways in which laws were created, first by rescripts, imperial responses to specific requests, which sometimes served as legal precedent, but were often merely restricted to the case in question. The second source of law was imperial laws or constitutions, positive prescriptive laws issued by the emperor. A major purpose of the Theodosian Code was to resolve some of the inconsistencies between these different forms of law, though ultimately they only ended up collecting imperial constitutions. The Theodosian Code aspired to be comprehensive in its treatment of Roman law, but this was only accomplished by the fifth century legal code of the emperor Justinian, the Digest.

The Theodosian Code was begun in 429 at the behest of Emperor Theodosius II. An editorial panel of nine collected and abridged laws extensively, excluding irrelevant material. An early version was finished in 435, but it underwent several years of editing and redaction under another editorial panel of 16. The completed Theodosian Code was published in 438. Theodosius II ratified the Theodosian Code in February 438; it was carried to Rome soon after and ratified by the Roman Senate as the law of the empire. The ratification process emphasized the essential unity of the divided Roman Empire.

The Theodosian Code is an intentionally Christian work, collecting only the constitutions of Christian emperors, since it begins with Constantine and omits the constitutions of the pagan emperor Julian. Book 16, in particular, deals with transformed religious nature of the Roman Empire, declaring that the religion of the empire was Orthodox Christianity and banning heresy. It also confirmed the legal status of Jews and Judaism as a separate, noncitizen group living under Roman rule. The Theodosian Cod

had a long afterlife among the barbarian successor states to the Roman Empire. A crucial textual witness for the Code comes from fifth and sixth century barbarian and Roman jurists, who collected and abridged the law code for use in the new kingdoms.

Cohorts (Auxiliary). *See* ***Auxilia***

Cohorts (Legionary)

Introduced early in the second century BCE, the cohort became the main tactical unit of the Roman legion from the late second century BCE. The transition from maniples to cohorts is attributed to Gaius Marius (ca. 107 BCE). Legionary cohorts are distinct from praetorian cohorts and auxiliary cohorts, which were different in size and tactical function; the use of *cohors* (pl. *cohortes*) for all these units is an example of the Roman tendency to adapt the same term to different institutions. The term “cohort” may also be used without reference to a particular division of the army, referring to a group of several hundred soldiers.

Legionary cohorts were not introduced by Marius. They were used on an ad hoc basis, for example, in the Roman wars in Spain, in the early and middle second century BCE, where cohorts gave the Romans a greater advantage than maniples. Cohorts had advantages over maniples; being larger, cohorts were better able to resist shock and more able to operate independently. The cohort reform abandoned the division of the manipular legion into age classes, the youngest *hastati*, the mature *principes*, and the older *triarii*, with different equipment and tactical roles. In the cohortal

legion, all infantry soldiers were equipped and fought in the same way.

Detail from the Column of Trajan. From the late second century BCE onward, Roman legions were organized into subunits termed cohorts. In the Empire, units of the Praetorian Guard and auxiliary infantry were also termed cohorts. Located in the Forum of Trajan, Rome, Italy. (fotokris/iStockphoto.com)

One legion had 10 cohorts; each cohort was made up of six centuries of 80 men each, giving a total of 480 men per cohort. At some time in the second half of the first century CE, the first cohort was expanded to 800 men, and organized into five centuries, rather than six. The first cohort was the most prestigious of the cohorts, as were its centurions.

Coins

The Roman monetary system initially relied on bronze bullion (*aes rude*) but in the late fourth century BCE Rome began to cast heavy bronze coins (*aes grave*) and bars (*aes signatum*). By around 300 BCE the Romans had adopted Greek-style silver coinage and they soon came to use lighter and more convenient fiduciary bronze coins.

"Ides of March" silver denarius. The obverse (heads) depicts a profile of Marcus Junius Brutus, one of Julius Caesar's assassins; the reverse (tails) depicts two daggers, a cap of liberty, and the legend EID MAR, referring to Caesar's assassination on March 15, 44 BCE. Located in the British Museum, London, United Kingdom. (The Trustees of the British Museum/Art Resource, NY)

The financial strains of the Second Punic War led to the creation around 211 BCE of the *denarius* system which (with some modifications) would remain in operation from the mid-Republic to the third century CE. The system consisted of the silver *denarius*, the gold *aureus* (worth 25 *denarii*), and the bronze *as* (initially worth a 10th of a *denarius*, but a 16th after ca. 141 BCE), as well as a variety of fractions such as the silver *sestertius* (a

quarter of a *denarius*) and the bronze *triens* (a third of an *as*).

Under the Republic the *denarius* dominated production but the *aureus* became increasingly common from the latter half of the first century BCE. Production was closely related to the military payroll, likely to have been the largest item in the state budget. Even a single *denarius*, worth more than a day's wages until well into the empire, was a substantial sum of money for the average soldier. Day-to-day transactions probably involved bronze coins or credit. The *denarius*, *as*, and even the rarely minted *sestertius* might serve as a unit of account for keeping financial records.

The zone of circulation of the *denarius* system gradually spread throughout the growing empire but many communities continued to mint their own coins and the Romans themselves perpetuated some local issues in certain cases. Debasement in the first and second centuries CE eventually led to the failure of the *denarius* system in the third century. The emperors Diocletian (284–305) and Constantine (306–337) managed to establish a new monetary system in the fourth century.

In addition to its economic functions, Roman coinage played an important role in communicating political messages, since millions of coins were produced and they circulated widely in the Mediterranean basin and beyond. Under the Republic, the *tresviri monetales* or moneyers produced the bulk of the coinage. Relatively minor magistrates, they tended to advertise the accomplishments of their ancestors on the coins. During the civil wars that plagued the Republic in the first century BCE, Roman coinage came to play a prominent role in propaganda. The most famous example is the “Ides of March” *denarius* that Marcus Junius Brutus produced with Lucius Plaetorius Cestianus in 43–42 BCE. The obverse of these coins features a bust of Brutus and the names of the issuing authorities while the reverse has a dagger on either side of a *pileus* (a hat symbolizing freedom) above the legend *EID MAR* (the Ides of March). The coins, probably struck to pay Brutus' army, reminded their recipients of Brutus' leadership in the assassination of Caesar on March 15, 44 BCE, liberating Rome from Caesar's dictatorship.

Under the empire Roman coinage promoted the interests and accomplishments of the emperors. Octavian, the future emperor Augustus, issued coins in 28 BCE with a crocodile and the legend *AEGVPTO CAPTA* to advertise his conquest of Egypt. Vespasian used coinage to remind his subjects of his conquest of Judaea and establish the dynastic claims of his

sons Titus and Domitian. To reward or encourage the loyalty of their troops, emperors would sometimes distribute donatives (*donativa*), large cash gifts, on important occasions.

Colline Gate, Battle of the (82 BCE)

The battle of the Colline Gate was an important battle in the Marian-Sullan Conflict. Sulla was anxious to defeat Mithridates VI of Pontus, against whom he had been campaigning since 88 BCE, so that he could return and avenge himself on the regime of Cinna and Carbo which had controlled Rome in his absence. He landed at Brundisium in 83 and marched north, joined by a number of conservative aristocrats.

In the spring of 82, while some of these aristocratic supporters campaigned in northern Italy, Sulla himself operated in central Italy. Many Italians were placated by his announcement that he would not interfere with their recent enfranchisement, but some, particularly the Samnites, remained hostile.

While Sulla was besieging the younger Marius in Praeneste, a large force of Samnites and Lucanians attacked the city of Rome. Sending cavalry ahead to harass them, Sulla made a forced march and caught up with this group at the Colline Gate, where they were besieging the city, around noon

on November 1.

Rather than wait, Sulla decided to give battle that afternoon. He commanded the center and left, while Crassus led the right. In the engagement Sulla's troops were pushed back, saved from serious losses by the onset of darkness. Crassus meanwhile not only held the right but broke the enemy's left, driving them in a rout as far as Antemnae, just north of Rome.

The turning of the enemy's flank gave Sulla the victory—and control of the city of Rome. Sulla inflicted a terrible revenge on the Samnites with a mass execution of 8,000 Samnite prisoners: their cries could be heard from outside a meeting of the Senate he had convened. "Some of the criminals are receiving correction on my orders," he ominously warned.

Column of Marcus Aurelius

The Column of Marcus Aurelius, begun during the reign of Marcus' son Commodus (180–192 CE) and finished in 193, is a victory column located in Rome which commemorates the Marcomannic Wars (166–180). Standing 40 meters (140 Roman feet, including the lost base), the column is carved with scenes from the Marcomannic Wars. Notable scenes include an early Germanic assembly and two battle miracles, as well as exceptionally brutal combat scenes between Roman and German forces. There is also an interior stairway, leading to a statue of St. Peter (presumably replacing a lost statue of Marcus Aurelius).

The narrative relief carvings are less intricate than those upon the column of Trajan. However, they are larger and in higher relief with

contrasting shadows increasing visibility. One of the most notable scenes depicts the Rain Miracle, where a bearded god stretches his arms over the drenched soldiers. In contrast with the column of Trajan, this monument shows infantry and cavalry fighting together as combined forces, possibly reflecting a shift in Roman tactics. Unfortunately, the column of Marcus has been damaged by acid rain, causing the reliefs to deteriorate.

The column of Marcus Aurelius is often confused with the lost Column of Antoninus Pius, which was located nearby. Indeed, Marcus adopted the name of his predecessor, and the Column of Marcus was also known as the Column of Antoninus. The monument is located in Rome's Piazza Colonna, along the Via del Corso (Via Lata), halfway between the Palatine and the mausoleum of Augustus. Previously, this area had been a cemetery (like the Via Appia), and Marcus was cremated here.

The column was restored by Domenico Fontana during the reign of Pope Sixtus V (1585–1590). In 1896, scholars concluded that the column can be read chronologically, spiraling from top to bottom. However, subsequent analysts have suggested that the scenes might be arranged thematically, and perhaps vertically (not spiraling).

Column of Trajan

Located at Rome in the Forum of Trajan, Trajan's Column was dedicated in 113 CE and finished in the reign of Hadrian (117–138). The most remarkable feature of Trajan's Column is the elaborate spiral narrative relief carving wound around the column, depicting the Dacian Wars (101–106 CE). The

Column was probably designed and built by Apollodorus of Damascus, Trajan's chief architect.

The central column is about 100 Roman feet (29.6 meters) tall and 12 feet in diameter, standing atop a podium carved with images of Dacian arms and armor. Trajan's Column is hollow inside, the base containing a chamber housing Trajan's ashes after his death, and the column containing a spiral staircase of 185 steps leading to the top. The column was originally topped with a statue of Trajan.

The central column is covered with a spiral narrative relief of Trajan's Dacian Wars, 200 meters long, depicting 155 separate scenes. The scenes and figures are carved in highly detailed low relief and were originally painted in bright colors, as with most ancient statuary and relief sculpture. Small bronze ornaments, such as weapons held by soldiers, were originally attached that have since disappeared. The relief is pierced by 40 slit windows, giving light to the interior staircase.

addressing the army, the emperor presiding over sacrifices, the emperor receiving delegates from the Dacians, the emperor meeting with his advisers, the emperor refusing or granting *clementia* to captives, and the suicide of enemy leaders. These scenes were highly ideological, the sacrifice scenes stressing for instance the emperor's role as mediator with the gods on behalf of Roman victory. The goddess Victoria (Victory) appears in some scenes. Scenes of *adlocutio*, the emperor addressing his troops, stressed the emperor's close relationship with the army.

Other scenes show the Roman army on the march; building camps, roads, and bridges; and fighting battles. These scenes have been used by Roman army scholars as a rich visual source, but they also were symbolic. Scenes of the Roman army at work may emphasize Roman *disciplina militaris* (military discipline), which extolled the virtue of physical labor in displaying and maintaining obedience. Building scenes also depict the Roman mastery of their physical environment, in contrast with the more primitive Dacians.

Though important battles (the Second Battle of Tapae and the fall of Sarmizegetusa) are depicted, Trajan's Column tends to downplay battle, in contrast with the many violent combat scenes on the Column of Marcus Aurelius. On Trajan's Column, Roman auxiliaries play a fiercer role in battle scenes. One auxiliary employs his teeth to hold the severed head of a Dacian by the hair while getting ready to slay another Dacian. The suicide of King Decebalus is depicted, as is the Roman soldier who severed his head as a trophy for the emperor. Other Dacian nobles are also depicted committing suicide after the fall of Sarmizegetusa, while Dacian noblewomen are led away into exile, and Dacian captives of lower status are shown collected for transport and sale as slaves. Non-Roman women appear to symbolize "civilians," whether subjects of the empire (greeted by Trajan in an *adventus* or imperial welcome scene) or representative of the enemy.

The narrative relief is rather difficult to view due to its elevation above the ground. Ancient spectators might have viewed it from the upper stories of the two nearby libraries that were part of the Forum of Trajan. Modern scholars have studied it from photographs and from casts taken of the reliefs. The standard edition is C. Cichorius, *Die Reliefs der Trajanssäule* (1896–1900), numbering the scenes (1–155).

Detail from the Column of Trajan, ca. 106–113 CE. In this scene from the Dacian Wars (101–102, 105–106 CE), Roman and barbarian warriors are clearly distinguished. Located in the Forum of Trajan, Rome, Italy. (Vittoriano Rastelli/Corbis)

Comes

Usually translated “count,” *comes* (pl. *comites*) was a rank of the Later Roman government and military. Its origin is obscure. Earlier Roman governors and emperors were accompanied by *comites*, “companions” or members of their private councils. After the administrative reforms of Diocletian and Constantine, *comes* might also be a title of civilian administrative officials, such as the *comes sacrum largitionum* or Count of the Sacred Largesses, a major fiscal official. *Comites* as military officers, clearly attested later in the fourth century, were lower-ranking than *magistri militum*. Provinces that did not have a *magister militum* assigned to them, but which still required a military presence, were assigned a *comes*. As did the *magistri militum*, *comites* commanded field forces independent of the frontier forces commanded by *duces* (singular *dux*, leader). Like the *magister militum*, the *comes* was responsible for deploying his military units when the frontier forces failed and under these circumstances probably took control of the forces of the *dux* as well as his own forces. *Comites* were notably deployed in Britain, North Africa and Egypt.

Comitatenses

The *comitatenses* were the fast-moving field division of the later Roman army. In the aftermath of the various foreign incursions and civil wars of the third century and tetrarchic period, the Roman army institutionalized a number of changes by the early fourth century. Rather than an army of 33 legions, of roughly 5,000 men each, generally posted in the frontier areas, and supported by a similar total of soldiers in separate units of auxiliaries, a new system evolved in the late third and early fourth centuries. Leaving aside barbarian federates and aristocrats’ armed retainers, the Roman army now consisted rather broadly of two classes of troops organized into a greater number of units which typically numbered no more than 1,000 soldiers each. The *limitanei* or *ripenses* were those posted to the frontier areas, while the *comitatenses* were the troops of the more or less permanent central field armies, each of which was commanded by *magister militum*. These field armies might be regionally focused or praesental armies attached directly to the imperial court, the *comitatus*. The conditions of service were more favorable for the *comitatenses* and especially for the troops associated with the emperor(s).

Whether the development of the praesental armies should be seen primarily as a gradual process beginning in the third century and accelerated by Diocletian or as an initiative of Constantine has been debated for some time. Although there are clear antecedents the current consensus favors Constantine’s actions as the decisive factor in making the distinction between *limitanei* and *comitatenses* permanent.

Organizationally, the legions and other regiments of the *comitatenses* were more numerous, but dramatically smaller than the old legions of the Principate. In addition to the legions, *auxilia palatina* served as the light and medium infantry of the central armies. Despite often having ethnic names, there is no sure indication that the *auxilia* were any less Roman in composition than the legions. Cavalry in the *comitatenses* was organized

into units called *vexillationes* that might be units of mounted archers, heavily armored lancers, or light cavalry. Units might be classified as either *palatini*, *comitatenses*, or *pseudocomitatenses*, indicating a degree of status, with the *palatini* being the most prestigious, and the *pseudocomitatenses*, units promoted from the *limitanei*, being the lowest.

After Constantine's death in 337 CE his unified praesental army was divided among his sons with further subdivisions under their *magistri militum* and smaller forces under *comites rei militaris*. This practice continued to develop over the fourth century, mirroring the process by which the eastern and western halves of the empire came to be governed by separate emperors. By the early fifth century, the *Notitia* lists five armies of *comitatenses* in the eastern empire under the command of *magistri*. These were two praesental armies as well the armies of the Roman Near East, Thrace, and Illyricum. In addition, *comites* commanded forces in Egypt and Isauria. In the western empire, the *Notitia* details a different, more vertical structure. All of the western *comitatenses*, which included the western praesental army, a regional army in Gaul, and six smaller forces under *comites*, were subordinate to the praesental *magister peditum*.

Despite modern notions of corruption and decline, the *comitatenses* in western Europe are still attested in Gaul and Italy through the late fifth century even after the collapse of the central government. In the eastern empire, despite some adjustments and reorganizations, the field armies of the *comitatenses* continued to function until the Arab conquests of the seventh century when they were converted into the territorially based themes of the medieval Byzantine army.

Comitia Centuriata

The *comitia centuriata* or “centuriate assembly” was one of the Roman Republic’s main voting assemblies. Tradition held that King Servius Tullius founded it in the mid-500s BCE, though its operation in early centuries is now hard to discern. Notionally the *comitia centuriata* could pass laws or serve as an appellate court, but really its main function was declaring war and electing the highest magistrates (consuls, praetors, censors). Technically a military assembly, it met in the *campus Martius* (“Field of Mars”), just outside Rome’s sacred boundary (*pomerium*). Consuls and praetors were its usual conveners.

The *comitia centuriata*’s voting procedure was exceedingly elaborate and complicated. During the census, the censors ranked male Roman citizens according to the amount of property they owned. This census evaluation of their wealth traditionally determined where citizens served in the army, and it certainly fixed each voter’s place in the *comitia centuriata*, which grouped citizens from richest to poorest into 193 voting units called *centuriae*. Polling within each *centuria* decided that unit’s vote. The richest *centuriae* voted first, and when a majority of 97 centuries had voted one way, voting ceased. Only the richest 18 *centuriae*, called *equites* or “cavalry,” were true centuries, as in groups of 100 men each. The lower *centuriae* were probably progressively larger, down to the enormous 193rd *centuria* into which most poor, landless Romans were dumped. This group, the *capite censi* or *proletarii*, would only ever vote in this assembly to break a tie, and the *comitia centuriata*’s procedure had the basic effect of disenfranchising the poor.

The other important voting assembly was the *comitia tributa*, or “tribal” assembly, organized from and named for the Roman citizen tribes (*tribus*) that were geographic rather than property based. It was more populist and overlapped to some degree with the *concilium plebis*, the “plebeian” assembly of plebeian citizens that the tribunes of the plebs presided over.

Commilito

Commilito (plural *commilitones*) is a form of address used by some Roman Republican commanders and emperors to their soldiers, with the meaning “fellow-soldier.” It probably developed as late Republican commanders’ attempt to bridge the social distance between themselves and common soldiers. The traditional recruitment structure of the Roman army derived its fighting men from small landowners (*assidui*), farmers with modest landed property; though commanders came from the upper strata of society, this model of military recruitment was relatively egalitarian. By the second century BCE, the economic status of some of the nobles had risen drastically; they became very wealthy, whether from conquest or from agricultural exploitation. The social and economic status of many of the soldiers fell, whether directly as a result of Rome’s overseas wars (they were unable to work their farms) or indirectly. By ca. 100 BCE, many common soldiers were now recruited from the landless poor.

The larger context of such a form of address was such commanders’ sharing the way of life of their soldiers: participating in combat training with them and enduring their hardships on field maneuvers and on campaign, including sharing their basic rations. Such conduct increased cohesion and loyalty in an army that now had a steep class divide. Many, though not all, nobles of the late Republic were quite wealthy and were accustomed to a much more lavish style of life than their soldiers. Gaius Marius, a “new man” (the first in his family to reach the consulship) from the town of Arpinum in central Italy, emphasized his common identity with his soldiers and shared their training and hardships. In Sallust’s *Jugurthine War* Marius gives a long speech that, though the historian’s invention,

represents his character, criticizing the arrogance, luxury, and military inexperience of the Roman nobility (Sallust, *Jugurthine War* 85).

However, possibly by the end of the late Republic and certainly during the Principate, *commilito* acquired a significance counter to its original meaning: the commander who used *commilito* not only leveled himself with but indulged his soldiers. For this reason, Suetonius' *Twelve Caesars* relates that Augustus is said to have refused to use the term *commilito* and enforced military discipline strictly (Suetonius, *Augustus* 25.1). Previous commanders had addressed this gulf between commander and common soldier through military discipline; for instance, Scipio Aemilianus at Numantia in Spain (133 BCE) prohibited officers from carrying luxury tableware (Frontinus, *Stratagems* 4.1.1).

In his *Histories* of the civil war of 69 CE, Tacitus depicts Piso, the emperor Galba's choice as heir, as addressing the praetorians as *commilitones* in an attempt to mollify their displeasure with Galba (Tacitus, *Histories* 1.29). Galba himself, who had initially refused the praetorians a donative, was confronted by the praetorians and demanded of the menacing soldiers, "Fellow-soldier, who gave the order?" (Tacitus, *Histories* 1.35). When the praetorians broke into a senatorial dinner party, Otho attempted to soothe them, addressing them as *commilitones* (Tacitus, *Histories* 1.83). Cassius Dio depicts Caracalla (211–217) as using *commilito* (in Greek translation) toward the soldiers, especially the praetorians, saying after his assassination of his brother Geta, "Rejoice, fellow soldiers, for now I am in a position to do you favors" (Dio 78.3.1). Dio believed that Caracalla favored the army over the Senate and other high-status civilians. When an emperor used *commilitones* toward his soldiers, reinforcing his bond with them, it also might suggest the existence of conflict between the emperor and the Senate or urban elite.

Commodus (Emperor) (180–192 CE)

Born in 161, Commodus (180–192) was the son of Marcus Aurelius, promoted by Marcus to the rank of Caesar before Marcus' death and thus marked as presumed successor, breaking with the pattern of adoptive succession that the emperors had followed since Nerva (96–98 CE). Commodus succeeded to his father without incident. He had accompanied Marcus to the Danube frontier to wage the Marcomannic Wars, but on his accession Commodus withdrew from the frontier and returned to Rome.

Commodus' conduct as emperor displeased the Senate and urban elite. Commodus notoriously fought in the arena as a gladiator, identifying himself with the Greek hero and demigod Hercules. He renamed the months of the Roman year after his own imperial titles. In the pattern of previous "bad emperors" such as Nero, Commodus promoted low-status persons to responsible positions. A palace conspiracy finally formed against Commodus, who was assassinated on December 31, 192.

Commodus' death without presumed dynastic heirs resulted in a short period of coups and civil wars, including the elevation of Pertinax (emperor 193), the assassination of Pertinax, the "auction of the empire" between Sulpicianus and Didius Julianus, and the rise to power of Septimius Severus (193–211). The main sources for Commodus' reign are Cassius Dio, Herodian, and the *Historia Augusta*. An eyewitness to events of the reign, Dio is the most valuable source.

Concordia

A minor goddess in ancient Roman religion, *Concordia* represents harmony, agreement, and unity, particularly in marriage and in political affairs. In the late Roman Republic, Cicero supported the concept of the *concordia ordinum* or harmony of the orders, hoping to inspire cooperation and unity between the Senate and the *equites* in light of competing political aims. Cicero worked to extend the concept further as a *consensus omnium bonorum* of all Roman citizens in hopes of preserving the Republic. This was not to be. Imperial coins, particularly those depicting imperial wives, often featured the goddess with the legend *Concordia*. In the imperial period, *concordia* was frequently invoked to emphasize the loyalty of Roman soldiers to the regime.

Conspiracy of Catiline (63 BCE), Causes

From an old but eclipsed patrician family, Catiline (108–62 BCE) was motivated in part by frustrated ambition. He had fought for the Sullans in the Marian-Sullan civil war, and was responsible for personally killing Marius Gratidianus, the nephew and adopted son of the famous Gaius Marius. Catiline held the praetorship in 68 and was governor of Africa in

67–66. He ran for consul without success in 65. That year he was prosecuted for extortion during his tenure as governor of Africa; though he was acquitted, the prosecution probably harmed his reputation, for he ran for consul again in 64 and lost. Cicero and Gaius Antonius Hybrida (an uncle of the famous Mark Antony) were elected for 63. Catiline ran again for consul in 63 and failed. In frustration Catiline launched the actual conspiracy against the incoming consuls and the Senate late in 63.

Catiline's own self-aggrandizement was a major cause of the Conspiracy.

Repeatedly losing in his quest for the consulship, Catiline was deeply in debt (political campaigning had become very expensive for Roman aristocrats). He and his followers hoped to enrich themselves from seizing the Roman government, possibly planning to repeat Sullan-type proscriptions. He also obviously sought personal vengeance against his political rivals. Catiline's aristocratic followers, such as Publius Cornelius Lentulus Sura (consul 71 BCE) and the woman Sempronia, are depicted as having similar motives.

However, Catiline also sought support via policies associated with the *populares*, such as cancellation of debts and land redistribution. He thus appealed to the indebted wealthy, to the poor urban population at Rome, and to poor rural citizens, including Sulla's veterans, who had received land redistributions from Sulla but, being more used to fighting than to farming, had mismanaged their farms and fallen into debt. It is not clear how much Catiline and his aristocratic followers were motivated by genuine sympathy for the impoverished masses and the desire for social justice. They may have exploited these sentiments to gain supporters.

In the surviving sources, Catiline is presented mainly from Cicero's perspective, the source of Sallust's *Bellum Catilinae*. Cicero emphasizes Catiline's villainy, stressing his role as a Sullan supporter in the vicious civil war and proscriptions of the 80s and also emphasizing his subsequent private crimes (including adultery, for which he was prosecuted). Catiline's advocacy of debt relief and property redistribution also made him more evil in Cicero's eyes, as Cicero was a major supporter of the wealthy elite at Rome, the so-called *optimates* or oligarchs. Cicero desired to make Catiline and his followers appear more formidable opponents, genuine threats to the stability of the *res publica*, justifying Cicero's summary actions as consul in December 63. Sallust's depiction of Catiline is more complex, setting him

against a background of moral decline; Catiline takes on a “paradoxical” character, exhibiting military virtues (courage, boldness, endurance) in attacking the state rather than defending it; Sallust gives archaic overtones to his death in battle, resembling heroes of the ancient Republic.

Conspiracy of Catiline (63 BCE), Course

In the Catilinarian Conspiracy of 63 BCE, Lucius Sergius Catilina, commonly known as Catiline, led a failed attempt to overthrow the Senate and take over the government of the late Roman Republic. In Oct.–Dec. of 63, the conspiracy was exposed and foiled by Cicero, one of that year’s consuls, and the Senate, which passed the *senatus consultum ultimum*, authorizing whatever degree of force was necessary to avert the crisis. Cicero arrested the conspirators, who were summarily tried and sentenced to death by the Senate. Catiline escaped to Etruria, joining his accomplice Manlius and his army. Catiline and his army were defeated in battle near Pistoria (Pistoia) early in 62. The sources for the Catilinarian Conspiracy are Cicero’s four *Catilinarian Orations* and Sallust’s *Bellum Catilinae* or *War with Catiline*, written a generation later. The precise motivations of the conspirators are obscured by partisanship. The consequences later included Cicero’s own exile at the instigation of Publius Clodius Pulcher, a tribune of the plebs, who also exploited Catiline’s supporters.

The Catilinarian Conspiracy was first exposed in October 63 when a number of anonymous letters, warning them of an impending assassination attempt on the Senate, were delivered to prominent members of the senate, among them Crassus. Cicero had the letters read aloud in the Senate. In response, on October 21 the Senate passed the *senatus consultum ultimum* or “last decree,” a bill authorizing a “state of emergency” in which the consuls were empowered to “see to it that the state shall come to no harm.” The SCU enabled the consuls to employ whatever degree of force might be necessary to avert or resolve a crisis.

On November 7, Cicero learned of a plot to assassinate himself, revealed by Fulvia (not the same Fulvia who was wife of Clodius Pulcher and Mark Antony), the mistress of one of the conspirators, Quintus Curius. Cicero summoned a meeting of the Senate and denounced Catiline in a speech published later as the First Catilinarian Oration. In consequence, Catiline fled the city of Rome and joined the army of his accomplice Manlius in Etruria.

To round up the other conspirators, Cicero suborned the Allobroges, a Germanic people who were involved in the conspiracy, and who succeeded in causing the other conspirators to incriminate themselves. The conspirators (among them Publius Cornelius Lentulus Sura, then praetor) were arrested and imprisoned on December 3. A debate was held in the Senate over how to punish the conspirators; it is dramatized by Sallust in the *Bellum Catilinae*. Julius Caesar advocated mercy toward the Catilinarians, but Cato the Younger, followed by most of the senators, advocated putting them to death. The Senate voted for the execution of the conspirators, who were strangled to death in the Tullianum, the ancient springhouse beneath the Senate House that was used as a prison.

Catiline and Manlius were now in open revolt. Gaius Antonius Hybrida and Marcus Petreius marched against them with two armies, pinning the Catilinarians near Pistoria in Etruria, where they gave battle. Catiline and his followers fought bravely but were defeated; Catiline himself was killed in the battle.

How far back the Catilinarian Conspiracy went is obscure. Cicero tendentiously presents Catiline as his mortal enemy for years preceding the events of Oct.–Dec. 63, alleging Catiline’s “First Conspiracy” in 65. The “First Conspiracy” repeats elements of the actual conspiracy of 63 (such as planning to murder the consuls) and has been questioned by scholars. The

degree of support for Catiline by influential political leaders of the day, especially Crassus and Julius Caesar, has also been extensively debated but not resolved.

Conspiracy of Catiline (63 BCE), Consequences

Cicero was glorified for his part in suppressing the Catilinarian Conspiracy. The Senate voted Cicero the title *parens patriae*, “Father of His Country,” setting a precedent for Augustus’ adoption of the title *pater patriae* in 2 BCE. Cicero even composed epic poetry praising his own actions as consul in 63 (quoted in Cicero, *De div.* 1.11–1.20), as well as a work *De consulatu suo* (“On His Consulship”) that was also self-glorifying.

However, Cicero’s enemies also did not forget the Catilinarian Conspiracy. Clodius Pulcher, a tribune of the plebs in 58, moved a law that exiled any politician who put citizens to death without trial. This law was retroactive and targeted Cicero for his summary execution of the Catilinarians in December 63. Cicero went into exile. Clodius’ gang of supporters tore down Cicero’s house in Rome. With Pompey’s support, another law was passed enabling Cicero to return to Rome in 57.

Catiline’s conspiracy never possessed adequate support for his objectives. Many of his followers were probably unwilling to resort to actual violence, arson, and general destruction. Thus, they shied from the conspiracy as soon as it was exposed and challenged. This was especially true of the urban *plebs*, who would be the chief victims of urban violence.

The conspiracy and its defeat had no effect on the root causes of conflict, namely, the economic issues of widespread debt and the increasingly sharp divide between rich and poor. This is possibly because Romans did not conceive of their problems in economic or social terms, but rather in moralistic frameworks that cast the conspirators as immoral enemies of the state. Romans also lacked tools and theories for examining and explaining the economic issues at work. There was likely little connection made between economic and social issues and the conspiracy itself.

Catiline's concept of *tabulae novae*, "new tablets," which would forgive some or all debts, never saw fruition. Nevertheless, lawmakers did address some grievances that the conspiracy had illuminated. In 62, Cato sponsored a bill to distribute grain at lower prices. In 58, Clodius passed the *lex frumentaria*, which supplied free grain to the urban poor. Bills in 58 and 55 allowed landowners to sell their land directly to the state, alleviating debt and encouraging investment. This aided failed farmers and allowed dispossessed landowners to return to their farms. Not all reforms aided the poor. The state enforced the repayment of debt, strengthening the creditor class. Customs dues on Italian ports were removed in 60, aiding traders and wealthy consumers. The state maintained the stability of the investor class, which undoubtedly strengthened the Roman economy as a whole.

Attributing these measures to the Catilinarian Conspiracy is likely an overstatement. Reforms would probably have passed regardless. Although Catiline's Conspiracy did fit into a general pattern of increasing violence and social and economic unrest during this period, it did not cause these patterns.

Social inequality remained a source of social and political conflict in the late Republic, exploited by Clodius the tribune and by Caesar for mostly political ends. It became associated with civil war because poor citizens were among the volunteer soldiers of the civil warlords. In the long term, the emperors supported welfare measures, such as distributions of free grain to the city population, to stabilize the existing order and reduce conflict. To deter unrest, Augustus also established a permanent military presence in the city of Rome: the Praetorian Guard, urban cohorts, and *vigiles* or fire brigade.

Constantine I (Emperor) (306–337 CE)

One of the most famous Roman emperors, Flavius Valerius Constantinus, better known today as Constantine I or Constantine the Great (306–337), was born on February 27, 272 CE in Naissus, Moesia Superior (Serbia) to the high-ranking Illyrian officer Constantius and Helena, who probably came from a family of moderate social standing in Bithynia. Constantius was subsequently promoted to the rank of Caesar (deputy emperor) by Diocletian (284–305), introducing his son to the imperial court and probable imperial ambitions. Although originally not designated to receive imperial power, Constantine was acclaimed as emperor in Britain following the sudden death of his father in 306. Victor of a series of civil wars, by 324 Constantine had become sole ruler of the Roman Empire. He imposed numerous changes on the Roman Empire, including reforms to the government and army, and most notably the creation of a new capital, Constantinople, and the official patronage of Christianity.

From his adolescence, Constantine's life was focused on the imperial court, as his father Constantius was an important member of the *Protectores Augusti Nostri* (Defenders of Our Augustus), an imperial bodyguard and staff college. Around 286, Constantius entered the imperial family, divorcing Helena and marrying the emperor Maximian's stepdaughter Theodora. Constantius' rise in imperial circles continued, and in 293 he was promoted by Diocletian to the rank of Caesar, active mainly in the western provinces. At some point after 293, Constantine moved to Diocletian's imperial court,

arguably as a political hostage to ensure Constantius' loyalty. Being a member of Diocletian's court meant being on the move, and between 297 and 303 it toured the eastern half of the Roman Empire, visiting Egypt, Syria, and Asia Minor. Between 303 and 304, the court journeyed to Italy and Rome, before returning to Nicomedia. During these years, Constantine observed large areas of the Roman Empire, and witnessed first hand the impact, practicalities, and limitations of imperial power.

On May 1, 305 Diocletian and Maximian abdicated as Augusti to be replaced by Constantius and Galerius in carefully choreographed ceremonies. Though courtiers may have believed that Constantine would be promoted to his father's old rank of Caesar, Diocletian declared that the two new Caesars would be Severus (in the western provinces) and Maximinus II (in the east). A few months after his appointment as Augustus, Constantius wrote to his co-emperor Galerius demanding that Constantine join him in Trier, a major imperial capital in western Europe. It is probable that Constantius did not trust Galerius with the well being of his son. Whatever the true circumstances of the request and its fulfillment, we know that by January 306 Constantine had joined his father in the western empire.

At Eboracum (modern day York, England) in 306 Constantius suddenly died, and Constantine was acclaimed as emperor by his father's troops and commanders. This news of Constantine's acclamation to the imperial purple did not go down well with the emperor Galerius. However, the nature of Constantine's military backing meant that Galerius had little choice other than to accommodate Constantine in the Tetrarchic system, and compromised by formally recognizing Constantine as Caesar. Constantine's promotion encouraged Maxentius, the son of the ex-emperor Maximian, to seize power at Rome.

Despite his successes on the battlefield, Constantine was probably aware of the fragility of his claims to imperial power. Whereas his father Constantius had acquired the rank of emperor through legitimate designation and accession, Constantine's acclamation at York was essentially a revolt. Consequently, Constantine needed to emphasize his legitimacy as emperor. He did so through his alliance with Maximian, Diocletian's co-Augustus, who had retired with Diocletian in 305. Maximian was not content with retirement and sought to regain the imperial power, especially after his son Maxentius claimed it for himself. Maximian's approach to Constantine in 307 for an alliance with Maxentius provided

Constantine with a link to legitimacy, sealed by Constantine's marriage to Maximian's daughter Fausta. However, Maximian's own position was ambiguous: his move to regain the status of Augustus was unlikely to be endorsed by the other Tetrarchs, particularly Galerius and his Caesar.

Head of Constantine I (306–337 CE), ca. 315 CE. Emerging as the victor of a vicious civil war, Constantine emphasized his own autocracy. He is best known for his conversion to Christianity and his creation of a new capital, Constantinople (also known as Byzantium). Located in the Capitoline Museums, Rome, Italy. ([iStockphoto.com](https://www.iStockphoto.com))

At the Council of Carnuntum, attended by Galerius, Diocletian (who remained in retirement), Maximian, Licinius, Maximinus, and Constantine,

Diocletian persuaded Maximian to abdicate for the second time, and Galerius promoted Licinius to the rank of Augustus; Maximinus and Constantine were confirmed as Caesars. The conference however did not settle matters among the Tetrarchs. Galerius declared Maxentius a public enemy. Maximian revolted again in 310, claiming the role of Augustus, and this time Constantine dissociated from him and apparently forced Maximian to commit suicide or executed him at Massilia.

Realizing he had to dissociate himself from Maximian and detach himself from the Tetrarchic model of imperial authority, Constantine reverted to the old concept of dynastic legitimacy. In presenting his father as a nephew of Claudius II Gothicus, Constantine not only emphasized his father's legitimacy as Augustus but also his own. Constantine, however, was careful not to entirely eradicate any connection to Diocletian, and ensured that his rule as emperor, although adopting an independent character of its own, was to some degrees recognizable as a continuation of Diocletian's. Constantine's ability to alter the public presentation of his regime demonstrates his supreme ability to adapt to changing circumstances, essential to understanding his success as emperor.

Although Constantine originally supported Maxentius against retaliation from Galerius in 307, by 311 relations between the two had soured, making war inevitable. In 312, Constantine crossed the Alps and invaded Italy. On October 28, after a series of victories, Constantine finally met Maxentius at the Milvian Bridge outside of Rome. The resultant battle was short but decisive, and in the ensuing rout Maxentius was killed. Constantine was now the undisputed ruler of the western empire.

Galerius had died from a long, painful illness in 311. In 313, with the death of Maximinus Daia in the eastern empire, Constantine's only remaining coruler was his ally Licinius. Peace between the two, however, did not last long. After a series of battles between 316 and 317, Licinius sued for peace, agreeing to hand over two of his Balkan dioceses (regions). Relations remained strained and in 324 Licinius and Constantine were at war again. After defeats at Adrianople and Chrysopolis, Licinius fled to Nicomedia, and there surrendered for the second and final time on December 16. Licinius was sent into exile in Thessalonica, where he was executed the following year. Constantine was now the sole emperor of the Roman world.

Building upon the work Diocletian had already begun in increasing the

number of Rome's fighting units, Constantine reorganized the Roman army. From the old army structure, Constantine established two armies: a frontier army, the *limitanei*, who were responsible for defending Rome's imperial frontiers, and a field army, the *palatini* and *comitatenses*, that provided a strategic reserve that could react quickly at times of military crisis. Constantine also disbanded the Praetorian Guard, since they had supported Maxentius, replacing them with the *Scholae Palatinae*, elite cavalry units.

Constantine promoted a somewhat more traditional social order than that of the third-century crisis and First Tetrarchy, emphasizing the preeminence of the senatorial order at least in Rome and Italy, which the senators were permitted to administer without interference. He returned certain civil offices to senatorial control. In 324, Constantine established a new imperial capital in the eastern Mediterranean, Constantinople, which was planned to emulate Rome in terms of architectural and cultural splendor. Furthermore, Constantinople was designed to provide a center of power in the eastern empire that could accommodate the ambitions of the eastern aristocracy. Thus, the establishment of a senate house in Constantinople designed to equal that of Rome allowed Constantine to directly involve the eastern elite in the governance of the empire, and made their incorporation into his imperial regime possible.

In the sphere of religion, Constantine acted to maintain the empire's unity by ensuring that the rapidly growing Christian religion was fully incorporated alongside Rome's pagan heritage. Constantine reversed the persecution edicts against the empire's Christian population, restoring property that had been confiscated. However, the emperor was not content simply to reverse persecutions and directly involved himself with the affairs of the Church. Concerned that internal strife could be as damaging as external persecution, Constantine summoned a council of the empire's bishops at Nicaea in 325 to reach agreement over a divisive theological question, the relationship of Christ to God. The resultant Nicene Creed partially unified the Church, though significant bodies of heretics, such as the Arians, would continue to divide it. Constantine's direct involvement in Church affairs has been argued to prove that Constantine was himself a Christian convert. However, it is arguably more likely that such involvement was a case of Constantine demonstrating that imperial authority pervaded every dimension of the Roman Empire.

Constantine was a remarkable leader of the Roman world. His rise to

power demonstrated a clear political and military capability unmatched by his rivals. He recognized the fragility of his legitimacy as emperor and was quick to rectify the situation, adapting his regime to the rapidly changing political situation. Once in power, Constantine demonstrated a great ability regarding fair governance, ensuring the wider welfare of the empire always came first. In honoring Rome's traditional religious practices, while simultaneously accommodating the emerging Christian population, Constantine promoted cohesive imperial community in which religious tolerance was to be observed. Constantine left the empire in a state of health that it had not seen since the time of Aurelian, and his successors were sadly to fail in maintaining his high standards.

Constantine has been a controversial subject for biographers and historians both in antiquity and modern times. The presentation of Constantine's character by ancient authors was strongly influenced by their religious convictions. The Christian writers Eusebius and Lactantius both present Constantine as a Christian hero, whereas the pagan historian Zosimus paints a very negative picture of Constantine. Even today, details of Constantine's life still spark heated debate among scholars, most especially regarding the true nature of his Christianity, and it is these lasting questions that serve to rank Constantine as one of the most fascinating characters of the Roman world.

Constantinople

Constantinople (Constantinopolis) was founded by Constantine the Great (306–337) in 324 on the site of Byzantium, a Greek city located at the strait between the Black Sea and the Sea of Marmara. Constantinople became a major capital of the eastern Roman Empire and the capital of the Byzantine Empire until its capture by the Turks in 1453. The modern Turkish city was renamed Istanbul.

Constantine's action was not unprecedented, as Roman emperors, especially the Tetrarchs, had previously designated provincial capitals, such as York (Eboracum) in Britain, Trier (Augusta Treverorum) in the Rhineland, and Nicomedia in Asia Minor, close to Constantinople. The strategic and political advantage of provincial capitals was proximity to the frontiers. An emperor who stayed at Rome risked losing touch with the provinces and losing control of the frontier provinces to revolts, usurpations, or barbarian incursions. The locations of Nicomedia, chosen by Diocletian (284–305), and Constantinople enabled access both to the Balkans in the north and west, and to the eastern frontier via Syria and Armenia. Constantinople was not systematically besieged in the period of the early later Roman Empire (to 476), though the Goths overran Thrace in the period preceding and after the Battle of Adrianople (378).

View of the Theodosian Walls, Constantinople. Constantinople (Byzantium) was located on the Bosphorus straits, a strategic location offering the later Roman emperors access to both Danube and Eastern frontiers. These defensive walls were built by the emperor Theodosius II (408–450 CE). ([iStockphoto.com](https://www.iStockphoto.com))

Termed a “new Rome,” Constantinople received a Roman-style senate and magistrates (quaestors, tribunes, and praetors). However, the dominant culture of the city was Greek. Constantine intended Constantinople to be a Christian city, founding churches, yet pagan temples persisted until later emperors such as Theodosius I (379–95) undertook a more systematic policy of abolishing them.

Constans (Emperor). *See* ***Civil Wars (House of***

Constantine)

Constantius I (Emperor) (305–306 CE)

Flavius Valerius Constantius, termed Constantius I (Chlorus), one of the Tetrarchs, was born ca. 240 and reigned as Caesar from 293 to 305 and as Augustus in 305–306. He was also a founder of the dynasty of Constantine the Great, his son by his first wife Helena. Constantius may have come from a minor aristocratic family in the Balkans, related to the emperor Claudius II Gothicus (268–270), though this relationship has been doubted, as it was promoted to give Constantine a more aristocratic genealogy. The details of Constantius I's early career are not known; he married Helena, a woman of relatively low status, whose son Constantine was born ca. 272. Constantius I rose as an army officer, then governor of Dalmatia, and probably praetorian prefect for the emperor Maximian after 286. In 293, Constantius I was designated Caesar, Maximian's deputy and presumed successor. To seal the alliance, or shortly earlier, Constantius divorced Helena and married Maximian's daughter Theodora.

As Caesar, Constantius I was in charge of Gaul and Britain. At this time Britain was governed by a usurper, Carausius, who also claimed northern Gaul. Constantius drove the supporters of Carausius out of northern Gaul, but Carausius and then his usurper Allectus continued to hold Britain. In 296 Constantius invaded Britain and fought a battle with Allectus' forces, defeating and killing Allectus. Constantius was merciful to Allectus' supporters and restored Tetrarchic rule in Britain.

In 303 Diocletian and Galerius began the so-called Great persecution of the Christians (303–313), which chiefly affected the eastern empire. Maximian allegedly inflicted the persecution in the western provinces, where Christians were less numerous, but according to Constantinian propaganda, Constantius tried to avoid persecuting the Christians. In contrast with the other Tetrarchs, Constantius, Constantine's father, is depicted favorably by the contemporary Christian authors Lactantius and Eusebius.

In 305, Diocletian and Maximian abdicated in favor of their respective Caesars, Galerius and Constantius I. Constantius thus became Augustus, but did not enjoy the role of senior emperor long; he died from natural causes in

306, enabling his son Constantine to claim the title of emperor at York. Constantine allegedly was hailed as emperor by his father's soldiers, unleashing a period of civil war (the Tetrarchic Civil War, 306–313). Constantius I's children included five other half-siblings of Constantine; one of these, Julius Constantius, was the father of Gallus and the future emperor Julian (361–363).

Constantius II (Emperor) (337–361 CE)

Flavius Julius Constantius, the third son of Constantine I, became Caesar ca. 324, co-Augustus in 337, and sole Augustus from 350 to 361. He spent much of his reign fighting the Sassanid Empire, Germanic tribes, and civil wars. He was responsible for the elevation of his cousin Julian to the title of Caesar. He and Julian were the last male descendants of the dynasty of Constantine. Constantius II also is noteworthy as an openly Arian Christian emperor and a strong supporter of Arianism. He died of illness on November 3, 361 at Mopsucrenae in Cilicia, while preparing to fight a civil war against Julian.

Born in 317 at Sirmium, Pannonia, Constantius II was the second son of Constantine and Fausta. He was named after his grandfather, who had been co-Augustus with Galerius from 305 to 306. At the time of his birth, Constantine was co-Augustus with Licinius. In 324, Licinius was defeated in civil war and Constantine raised Constantius to the rank of Caesar. Constantine sent the young Constantius to the eastern frontier to resist the incursions of the Sassanid Empire. He conducted a successful campaign that

was cut short by news of his father's ill health. Constantius was with his father near Constantinople when he died in 337.

On his death, Constantine divided the Roman Empire among his sons; Constantius II became co-Augustus in the eastern empire. He also ordered a purge of the imperial family, killing two uncles and six cousins and thus removing potential rivals. Constantius immediately returned to the eastern frontier to fight a new invasion by Shapur II. While Constantius waged a generally successful war against the Sassanids in the east, his brothers, Constantine II and Constans, fought a civil war. Constantine II was killed in 340 and Constans became sole Augustus in the western empire.

Constantius still was fighting Shapur II on the eastern frontier when the usurper Magnentius declared himself emperor in the west and had Constans murdered in 350. Constantius refused to recognize Magnentius and prepared for war. He elevated his cousin Gallus to Caesar in the eastern empire and moved west against Magnentius. Constantius defeated Magnentius at Mursa Major in 351 and Mons Seleucus in 353. Magnentius committed suicide, and Constantius gained control of the entire Roman Empire. He at once turned his attention to fighting Germanic incursions along the Danube and Rhine.

After Gallus' short but turbulent reign as Caesar, Constantius had Gallus executed for suspected conspiracy in 354. It was now clear to Constantius that the empire faced too many threats for just one man to handle. He turned to his last remaining cousin, Julian (the younger brother of Gallus), and in November 355 made Julian Caesar in the western empire. While Julian fought the Franks and Alamanni in Gaul, Constantius campaigned against the Sarmatians and Quadi along the Danube. However, by 359, there was a renewal of war against Shapur in the eastern frontier. For his war against the Sassanids, Constantius ordered a large portion of Julian's Gallic army to move eastward. The soldiers rebelled and hailed Julian as emperor in 360. Constantius found himself trapped between the serious threat of Shapur on the eastern frontier and Julian's rebellion in the western empire. Constantius began to move westward to face Julian, but the two never met in battle because Constantius died of fever on November 3, 361 in Cilicia. On his death bed, he was baptized an Arian and named Julian his successor.

Constantius III (Emperor). See Fall of Roman Empire; Galla Placidia (Empress)

Consul

Consuls were the most powerful annually elected magistrates in the Roman Republic. According to tradition, the office was established in 509 BCE after the end of the monarchy. Modern scholarship of the early Republic has challenged this model, pointing out alternate supreme magistrates such as the early praetors and military tribunes with consular power; the primacy of the consulship took some time to evolve.

To continue with the traditional account, the position of consul somewhat resembled former monarchy—the consuls retained much of the same powers and even borrowed much of the royal insignia. However, there were notable differences between consul and king. The traditional religious role of the kings was given to the *pontifex maximus* and *rex sacrorum*. The consuls retained only *auspicium*, the right to perform public divination. To prevent the abuse of power by a single ruler, two consuls were elected annually. Initially both consuls were from the patrician class, but after the year 367 plebeians were allowed to run for the office. Consuls were elected

by the centuriate assembly and because they traditionally had to hold lower magistracies to be considered acceptable candidates, consuls were usually over the age of 40. The minimum age of 42 was set by a law of 180 BCE and reiterated by the dictator Sulla; to hold the office at this minimum age was considered particularly prestigious.

The Romans also named their years after the two consuls who were in office at the time. Traditionally, consuls entered office March 15 and remained for 12 months, thus a year such as March 15, 205–March 14, 204 BCE would be named the “year of the consulship of Publius Cornelius Scipio Africanus and Publius Licinius Crassus Dives.” After 153 BCE, consuls took office on January 1, though by the late Republic the Roman calendar was out of sync with the solar year until Julius Caesar’s reform of the calendar. However, this practice of naming the year after the consuls continued into the empire.

While inside the *pomerium* (the boundary of Rome itself), the two consuls served as the heads of government. They also had the power to convene the Senate and citizen assemblies. The consuls also served as the chief diplomats for Rome, and all foreign envoys had to meet with them before appearing before the Senate. In consuls’ absence, their duties were handled by the urban praetor. In addition, though priests handled most religious functions in Rome, consuls did perform certain specific rituals related to public divination (*auspicium*). Consuls outranked virtually all other elected magistrates, though there were exceptions. Supreme offices alternative to the consulship during the Republic included military tribunes with consular power, decemvirs, and elected dictators, all much rarer; the first two were seen only in the early Republic.

The consuls’ military power was arguably even greater than their civic authority. The magistrates were trusted with full *imperium*, meaning they had ultimate authority over almost every aspect of the campaign. Given the militarism of Roman society, consuls went to war on a regular basis. The consuls called for the levy of Roman citizens and further oversaw the organization of forces from Roman allies. A consul’s army typically contained at least two legions plus an equal number of allied troops. As Rome continued to expand during and after the Punic Wars, consuls enjoyed greater authority than ever. On campaign, they had the ability to do almost whatever they wished diplomatically and militarily without much resistance from the Senate.

There were some checks on consular authority. Each could veto the other. Tribunes of the plebs were not subordinate to the authority of the consuls and could block most consular action. Within Rome itself, citizens held the right of *provocatio*, which enabled them to appeal to the people any punishment possibly levied by the consul or any other magistrate. The Senate decided where consuls would be deployed, and if a consul went against the Senate's wishes he could find himself appointed to a trivial command with no chance for military glory. An additional check was that a consul could be prosecuted for his actions after he left office. Caesar, for instance, specifically obtained deployment as proconsul to Gaul to avoid this prosecution. Sulla placed additional restrictions upon consuls, requiring them to stay in Rome during their tenure of office, so that commanders thence were promagistrates.

Under the empire, the office lost most of its former power. While still formally elected, now by the Senate, consuls were often nominated by the princeps. One of the two consular positions was often held by the emperor himself, and with imperial authority superseding that of the consuls, the office gradually dwindled to little more than a symbol of Rome's Republican heritage. However, the consulship remained a desired office and route of gaining individual prestige and influence in imperial society.

Consular authority could be prorogued if necessary. If this occurred, the consuls would become proconsuls and still be able to govern their province or command an army, albeit with certain limits on their extended powers. If a consul resigned or died in office, a suffect consul would be elected by the *comitia* or appointed by the Senate, though during the imperial period suffect consuls were chosen by the emperor and increased in number (up to 12 per year) to make the honor more available.

Corbulo (Cn. Domitius Corbulo) (d. 67 CE)

A Roman general during Nero's eastern wars (58–63 CE), Corbulo led two successful campaigns to recover Armenia from the Persians. His victories abroad and reputation for rigid military discipline brought him great fame. But Nero worried that Corbulo's fame might eventually rival his own. He ordered the general's death in 67, although Corbulo had never given any indication of disloyalty.

Little is known of Corbulo's early life and career. He was born sometime around 4 CE to the clan of the Domitii, an old senatorial family which prided itself on upholding Roman tradition. Corbulo's father, who served as praetor, famously once chastised a younger nobleman in the Senate for not giving up his seat to an elder statesman. Corbulo followed in his father's aristocratic footsteps, becoming consul in 39. He also served as proconsul of Lower Germany (47 CE) and Asia (sometime before 54 CE) prior to his Armenian expeditions. His German command is especially noteworthy as the period when he honed his reputation as a stern disciplinarian.

But it was the Armenian crisis at the outset of Nero's reign that finally let Corbulo showcase the true extent of his martial abilities. He invaded Armenia in 58 after spending nearly four years preparing his troops. With such careful planning, Armenia's current ruler, the pro-Persian Tiridates, could do little to halt the Roman advance. After forcing Tiridates to flee, Corbulo captured the kingdom's twin capitals of Artaxata and Tigranocerta. The former surrendered after a brief siege once Corbulo catapulted the head of a local nobleman behind the city walls; the latter capitulated at the mere

sight of the approaching Roman army. By 60 CE, a pro-Roman candidate had been placed on the Armenian throne, and the kingdom was once more firmly under Roman control.

Any progress Corbulo made in Armenia was soon undone by his successor, Caesennius Paetus. Paetus had none of Corbulo's patience or resolve and, in his haste to outdo Corbulo, led his army into a Persian ambush at Rhandaia. The Rhandaian disaster convinced Nero that only a diplomatic compromise could end the Armenian crisis once and for all. Yet Roman honor demanded that Paetus' loss first be avenged. Nero thus ordered Corbulo to attack Armenia again in 63. On this occasion, though, Corbulo's invasion was largely just for show. After sufficiently demonstrating Roman power Corbulo met with Tiridates at the site of Paetus' defeat. It was agreed that Nero crowned Tiridates as Rome's client monarch, then Rome would recognize him as Armenia's king.

In Rome, Nero claimed Corbulo's victories as his own. The emperor celebrated a triumph over the Persians and commemorated Tiridates' visit with a lavish public festival. Amid all this Corbulo remained Nero's faithful servant. The Pisonian conspiracy (65 CE), nevertheless, made Nero suspicious of any potential rivals. While touring Greece in 67, Nero summoned Corbulo from the eastern frontier. Upon arriving Corbulo received word that he had fallen into disfavor. He chose to take his own life rather than let his family risk Nero's wrath.

Coriolanus (Active 490s BCE)

Gnaeus Marcius Coriolanus was a semi-legendary Roman general of the early Republic who defected from Rome to the Volsci, a people of central Italy. According to Roman tradition, he won his name after capturing the settlement of Corioli from the Volsci in 493 BCE. Because Coriolanus authorized distribution of grain to the hungry poor at Rome, he was charged with tyranny and was exiled by the Senate. He went into exile and defected to the Volsci. Becoming a leader of the Volsci, he besieged Rome. The intervention of his wife and mother persuaded Coriolanus to abandon the siege; the enraged Volscians then killed him. Coriolanus is poorly documented (his name does not appear in the *Fasti*, official lists of consuls, dictators and other chief magistrates of the Roman Republic) and may be a legendary figure, the subject of Roman historical dramas that were treated as history by Plutarch's *Life of Coriolanus* and Dionysius of Halicarnassus. Alternately, in the view of Timothy Cornell, his story represents a period of Roman history when competing warrior band or clan leaders, of which Coriolanus was one, struggled for the domination of Latium and central Italy.

Cornelius Lentulus Gaetulicus (d. 39 CE)

Publius Cornelius Lentulus Gaetulicus was a Roman noble executed for conspiracy against the emperor Gaius (Caligula) in 39 CE. Gaetulicus was consul in 26 CE and subsequently legate of Upper Germany (30–39). In 39, Gaetulicus was accused of conspiring to assassinate Gaius and was executed with his fellow conspirator Marcus Aemilius Lepidus.

Cornelius Scipio, Publius (d. 212 BCE)

Publius Cornelius Scipio, father of Scipio Africanus, was consul in 218 BCE, at the outbreak of the Second Punic War, he was initially assigned the province of Spain. Learning that Hannibal had already entered southern Gaul, Scipio tried but failed to intercept him at the Rhône River. Bringing his army to northern Italy to await the Carthaginian invasion, he nonetheless dispatched a detachment to Spain under the command of his brother Gnaeus. Scipio first confronted Hannibal in a cavalry skirmish at the River Ticinus, which ended in his defeat. Wounded in the fighting, Scipio was rescued by his son (the future Africanus), an event which helped to launch the young man's remarkable political career. Uniting with fellow consul Tiberius Sempronius, Scipio suffered an enormous defeat at the River Trebia, although the favorable tradition recorded by Polybius reports that Scipio had advised against the engagement, and that the mistakes belonged to his consular colleague. By 217, Scipio had sufficiently recovered to join his brother in Spain, where they successfully held the Ebro River line. In 212, the two brothers split their armies for an offensive that yielded some successes, including the capture of Saguntum. The Carthaginian generals Mago and Hasdrubal Gisco, however, managed to unite their forces against Scipio's isolated army, having arranged for the defection of his Celtiberian mercenaries. Scipio fell fighting; his brother was defeated and killed shortly

afterward in a separate engagement. His son, who then had only held the aedileship, undoubtedly owed his election to the extraordinary command in Spain in 210 to the reputation of his politically prominent father.

Crassus (Marcus Licinius Crassus) (115–53 BCE)

Marcus Licinius Crassus was born ca. 115 to Publius Licinius Crassus, a Roman politician. Crassus may have started his military training as *contubernalis* under his father in Spain. His father and older brother were executed by the Marians when Marius' supporter Cinna took control of Rome. Crassus fled and went into hiding in Spain where he had family contacts. When Crassus learned that Sulla was heading back to Italy, he raised a small army of provincial clients and crossed first to Africa to link up with Quintus Caecilius Metellus Pius (a Sullan supporter), but he fell out with him, so crossed to Greece, joining Sulla there. He played an important role in Sulla's victory, operating in north Italy with Metellus and Pompey, and in particular was successful on his wing at the battle of the Colline Gate in November 82.

The beginnings of Crassus' large fortune came from the Sullan proscriptions, and he made astute political use of it to advance the careers of others. After his praetorship, probably in 73, Crassus offered to take over command of the war against Spartacus, when others, including the consuls of 72, had failed. Though technically a *privatus* by then, Crassus was given command of a large army, eventually defeating Spartacus (72–71) and ordering large-scale crucifixion of the defeated slaves along the Appian Way.

Though a rival of Pompey, who had also advanced under Sulla and who had even claimed credit for ending the slave war, Crassus joined with

Pompey in running for the consulships of 70. Crassus was technically qualified to run, but Pompey needed a dispensation as he was too young to be consul. Their joint program restored the powers of the tribunate that Sulla had taken away and divided the criminal courts between senators and *eques*. Neither took a provincial command after their term of office.

In the mid- to late 60s Crassus is associated in the sources with various schemes to counteract Pompey's growing military fame and influence. As censor in 65 Crassus tried to give citizenship to the Transpadani and to annex Egypt, but these attempts were foiled by his colleague, Quintus Lutatius Catulus, and they both ended up resigning. He supported the early ambitions of Catiline, until the latter proposed the cancellation of debts—hardly something which Crassus would condone. He may have supported the agrarian proposal of Publius Servilius Rullus in 63.

Crassus also promoted Caesar, enabling him to take out large debts in 62 and so freeing him to depart for his governorship in Spain. On Caesar's return, Pompeius and Crassus supported Caesar's bid for the consulship of 59, forming what is called "the first triumvirate." Caesar paid his political debt back by carrying legislation for a reduction in the price paid by *publicani* for the Asian tax-collecting rights—a request which Crassus had promoted and in which he probably had a personal involvement.

The triumvirate was inherently unstable: when Caesar left for his Gallic command, Crassus turned to supporting Clodius, who was threatening attacks on Caesar's consular legislation and on Pompey's interests. But Clodius was too ambitious to be a reliable ally. When attacks on the triumvirate increased and there were threats to replace Caesar in his Gallic command, Caesar met with Crassus at Ravenna in winter 56 and all three then met at Luca to forge a new agreement: Pompey and Crassus were to become consuls for 55, with subsequent five-year commands in Spain and in Syria, respectively and a five-year renewal of Caesar's command. Crassus probably wanted a military victory to keep up with his younger rivals, though he was now nearly 60 years old.

Before the end of 55, Crassus left for Syria. It is not clear whether the law proposing all the commands authorized Crassus to attack the Persians, but that was certainly his intention, as he needed a major victory to secure the prestige he desired. Ancient authors regard Crassus as motivated by greed, but there were valid reasons for the campaign: continual bickering between Armenia and Persia was likely to upset Roman interests in the area

following Pompey's settlements in 62. The size of Crassus' army, probably seven legions and 4,000 cavalry, suggests that the Senate contemplated war against Persia.

Crassus spent his first campaigning season in 54 crossing the Euphrates, reconnoitring the area and setting up garrisons and depots, especially along the Belikh River. He returned to winter in Syria, to train his troops and to complete financial preparations for the next campaigning season by plundering temples (such as the Temple in Jerusalem) and extorting large sums of money (attributed to his greed). In the spring of 53, Crassus crossed the Euphrates again; he moved away from the river, persuaded by Abgar, an Arabian guide, that the Persian force, led by the Surenas, was heading southeast. After a desert crossing to the Belikh River, Crassus caught up with the Persians near Carrhae on June 9, but the Romans suffered heavy losses at the hands of the enemy archers. The Roman army fled to Carrhae, then toward Sinnaca; invited to a parley, Crassus was treacherously captured and killed.

One ancient story has it that gold was poured down the dead Crassus' throat to symbolize his greed; another that a performance of Euripides' *Bacchae* at the Persian court used his severed head as a prop.

Carrhae was a disastrous loss, and the death of Crassus had repercussions for the growing rift between Pompey and Caesar. Crassus suffered from a bad press because he was ultimately a loser, but he was a master of the game of politics. He was reputedly the richest man in Rome, and that was probably true until Pompey returned from his victories in the eastern Mediterranean, when he could probably have bought Crassus out many times over.

Criminal Procedure

In ancient Rome, not all criminal acts were regarded as public (capital) crimes; some violent or harmful acts were regarded as delicts, private wrongs that could be prosecuted as civil actions (roughly analogous to Anglo-American torts). Delicts included *iniuria*, “insult,” which might include physical assault short of murder; delicts were usually punished by the imposition of fines. Violent and harmful acts that were prosecuted as public crimes included treason, parricide, extortion, murder, poisoning, and in the Principate public disturbances and adultery. Criminal procedure evolved from ad hoc trials by the Roman people to trial in standing courts (*quaestiones perpetuae*), dominant during the late Republic, to summary judgment by the governors, the emperors, and their legal advisers (jurists). Criminal laws were established with the courts and continued to apply even when the standing courts fell into disuse. At all times, the Roman criminal legal system lacked a formal prosecutorial infrastructure (public prosecutors and police) and depended on private delation and private prosecution. Criminal prosecution was also highly susceptible to political manipulation and abuse. The scale of penalties for the convicted was determined by status (see “Civil rights”).

During the early and middle Republic (down to 149 BCE), jurisdiction over capital or public crimes was delegated by the praetor to lesser magistrates who presided over ad hoc trials by the Roman people. Public crimes included murder, arson, witchcraft, corruption, and military cowardice or incompetence. The episode of the Bacchanalia, a disorderly and allegedly seditious religious cult, resulted in a public trial (Livy 39.14), as did an episode of female poisoners (Livy 40.32.4). A citizen seeking justice brought an accusation before the praetor resident at Rome, who would delegate a lesser magistrate, a quaestor, aedile, or tribune. The magistrate would organize a date for the citizen assembly to meet. At the assembly, the plaintiff and defendant would speak on their own behalf; any evidence would be presented, and the assembly would vote on the verdict and the penalty.

In the last two centuries of the Republic, such *ad hoc* trials, which were cumbersome to organize, were replaced by standing criminal courts, the *quaestiones perpetuae*. The laws that established these courts also defined the crimes. The first, created in 149 BCE by the *lex Calpurnia de repetundis*,

was the *quaestio de repetundis* or court in charge of recovering extorted money; it tried magistrates and provincial governors who were accused of extortion. The *lex Calpurnia* established panels of equestrian jurors and specified restitution, requiring the defendant to pay back the extorted money to the victim. Many subsequent laws revised the scope of the court, the penalties, and the composition of the jury panels, replacing the equestrians with senators. Because senators were unwilling to convict their fellows, the court was only partially effective in checking extortion. Populist politicians attempting to counter the Senate passed laws empanelling equestrians. Augustus streamlined the court by appointing five senatorial *recuperatores* to supervise proceedings and limiting compensation to simple restitution.

Other *quaestiones perpetuae* are best known through their originating laws that persisted in force during the Principate. During his dictatorship (82–81 BCE), Sulla's *lex Cornelia de sicariis et veneficis* created a court for trying murderers and poisoners, and his *lex Cornelia de falsis* created a court for trying forgers and counterfeiters. Sulla's *lex Cornelia de maiestate* defined treasonous activity by provincial governors: they were required to remain within and keep their armies within their *provinciae* or risk prosecution for treason.

Augustus' *lex Iulia de vi publica* of 18 BCE made it a capital crime for a magistrate or governor to physically harm a citizen (violating the victim's right of *provocatio*). A *lex Iulia de vi privata* made it a public crime to store weapons in one's house (for seditious purposes) or to cause a public disturbance by brandishing weapons. The interpretation of the law allowed Roman travelers to carry weapons for their protection on the road and in remote areas, due to the prevalence of bandits. The most notorious of Augustus' criminal laws was the *lex Iulia de adulteriis*, which made adultery a public crime for the first time (see "Adultery"). Other Roman criminal laws and their juristic commentary are collected in Digest books 47 and 48.

However, in the late Republic and empire, provinces, governors also had summary jurisdiction over capital crimes, giving justice as they saw fit, except for the indictment of Roman citizens, who had the right to a trial at Rome. This judgment was termed *cognitio extra ordinem*. In the Principate, the criminal courts continued to exist for some time, but summary jurisdiction by the governors and by the emperors and their legal assistants

were more important, and the emperors' decisions became regarded as law. The Senate tried capital cases involving its own members. Appeal to the Roman people was replaced by appeal to the emperor, even against decisions by his own governors. Summary execution was most likely in cases of treason (*maiestas*), when the normal practices exempting high-status citizens from the death penalty did not apply.

At all times Roman criminal process, lacking a formal prosecutorial infrastructure, depended on private delation (informers) and private prosecution. Magistrates, politicians, or private persons could inform or bring charges, though private persons more often sought professional forensic orators (such as Cicero) to represent them in court. Forensic orators should not be termed "lawyers"; they were experts in oratory and political affairs as much as law, and were usually senators themselves or wealthy equestrians who were the patrons of the people they represented.

Prosecution was frequently exploited for political ends, politicians prosecuting their rivals for *repetundae* and other crimes. In 187–184 BCE, the famous Scipio Africanus and his brother Lucius Cornelius Scipio Asiagenes fell from prominence when they were prosecuted for embezzlement during Lucius' command in Asia Minor. The *repetundae* court was especially given to politically motivated prosecutions. The most famous *repetundae* prosecution was Cicero's prosecution of Gaius Verres, a corrupt governor of Sicily, in 70 BCE.

In *cognitio extra ordinem*, governors' judgments might be harsh, or influenced by popular pressure. The best known judgment is that of Pontius Pilate over Jesus Christ, when Pilate was allegedly pressured by the Jews to render a capital verdict.

Cult of the Emperor

The cult of the emperor, also known as the imperial cult, was both a religious and political institution of the Roman Empire. According to Duncan Fishwick, an expert on the imperial cult, political power had a religious dimension, just as religious cults might have a political dimension. In practical terms, the cult of the emperor involved the worship of the emperor's *genius* (the divine spirit associated with him) and the creation of special priesthoods (*sacerdotes* or *flamines*) to carry out the relevant rites. In general, the cult did not involve treating the emperor as divine in direct social and political interaction, although a few emperors, including Caligula and Diocletian, may have encouraged this. Although Cassius Dio, writing in the early third century CE, presents the cult as a tool of empire-wide unification, this was not always the case, and the cult itself was far from a single coherent system.

In the Hellenistic kingdoms following the death of Alexander the Great, a tradition of ruler cults became well established. Local communities established these cults in gratitude for a ruler's patronage and benefactions, demonstrating their allegiance to him or her. These cults enabled local communities to maintain a symbolic link with an often absent and distant

political authority. It was upon these pre-existing Hellenistic foundations that the Roman imperial cult was gradually established in the eastern empire, adopting and utilizing many original elements, such as the erection of statues of the emperor accompanied by dedications within temples to other deities—especially that of Roma—at which people could seek sanctuary. Since the imperial cult was founded upon its Hellenistic predecessor, it was easily disseminated in the east via statues and other images of the emperor. Although the imperial administration encouraged a uniform provincial system in the east, local communities retained their traditional autonomy to establish such cults.

Whereas the Hellenistic world offered the Romans a cultural precedent for the imperial cult, at Rome the situation was more problematic due in part to Roman attitudes toward monarchy. Consequently, Augustus, recognized as Rome's first emperor, took care to appear to preserve Roman Republican traditions. Therefore, apart from approving a divine cult for his dead adoptive father Julius Caesar, during his lifetime Augustus restricted any cult activity centered on himself at Rome to the worship of his *genius* (his divine inspiration), which was incorporated into Roman families' private religious practices. It was only after Augustus' death that the Roman Senate declared him a god and that consequently a formal cult and priesthood could be established at Rome and throughout the western provinces, a policy then followed for the deification of Augustus' successors. Thus, the imperial cult at Rome and in the western provinces became a fundamental component of Roman imperial rule, and unlike the localized cults of the east was controlled exclusively from the center. However, whether locally inspired in the east or controlled by the central imperial administration in the western provinces, the cult's purpose was identical, focusing the loyalties and concerns of the empire's population on the person of the emperor.

Conversely, the imperial cult could also become a focus of political disloyalty and disapprobation. At the height of treason trials in the reign of Nero (54–68), disrespect to the imperial image (even the emperor's image on a coin) was persecuted as disloyalty. Mutinies might focus on the imperial image; in their revolt against Galba (68–69 CE), the legionaries of the Rhine frontier stoned his images carried on military standards. The Senate had the right to decree *damnatio memoriae*, the systematic effacement of a hated ruler's inscriptions and images.

Despite unifying the attentions of the empire, and in so doing reinforcing the image of the emperor as its supreme guardian and benefactor, the cult was also a focus of religious friction, especially among the Empire's monotheistic communities. The notion of worshipping an emperor, dead or alive, ran against Jewish religious practice, which featured no images of the Jewish God. An attempt by Caligula to erect a cult image of himself in the temple in Jerusalem was met with such fierce resistance that he was forced to back down. Other emperors gave the Jewish community the special privilege of exemption from direct involvement in imperial cult. While the Jewish community did not offer sacrifices and prayer *to* the emperor, they did do so "on his behalf" or "for the emperor's well being."

The empire's Christian community also came under scrutiny regarding the imperial cult, and their refusal to worship the emperor was treated as a sign of disloyalty. We know from Pliny the Younger's letters to Trajan that one of the methods by which individuals were forced to either prove their non-Christian status, or to renounce their Christian status, was to offer a libation to the emperor, or to the traditional pagan gods on the emperor's behalf. Despite the imperial cult's involvement in the persecution and suppression of Christianity, ultimately the establishment of Christianity as the empire's sole officially recognized religion in 380 CE dealt it its deathblow. Although Theodosius I (379–395) officially outlawed the imperial cult along with all other pagan practices at this time, its end had little impact on the exalted status of the Later Roman and Byzantine emperor, which was expressed in court ceremonial and abstract honorifics such as "Your Sublimity."

Cults, Pagan (Illicit)

From time to time during the last two centuries of the Republic and in the early empire, the Roman authorities repressed pagan cults that were regarded as a threat to public order. The best-known instance of such repression is the suppression of the Bacchanalia in 186 BCE. Other cults that the Roman Republic suppressed or discouraged included the cults of Isis, Osiris, and Serapis, Egyptian gods seen as foreign to Rome. After conquering an enemy people, Roman destruction of the enemy's sacred sites was not uncommon. In the empire, though the overall attitude to foreign cults became more tolerant, the Roman authorities persecuted Druidism in Gaul and Britain because it may have been a focus for native resistance. Governors were expected to monitor private associations (*collegia*), many of which were religious associations venerating a pagan deity or deities. These attitudes toward illicit cults and associations also informed the Roman government's treatment of Christians.

The suppression of the Bacchanalia is best attested in Livy's *History of Rome* (39.8–19) and in a surviving decree of the Senate. The Bacchanalia were cultic associations worshipping Bacchus, the god of wine and inspiration, akin to the Greek Dionysus. According to Livy, the cult had changed its nature, holding secret and transgressive nocturnal rites, and was growing rapidly. Originating in Etruria, it had become widespread not just at Rome but in Italy. When informed of the cult by Publius Aebutius and his mistress Hispala Faecenia, the consuls Spurius Postumius Albinus and Quintus Marcius Philippus opened an extraordinary prosecution (*quaestio*), arresting and detaining cult priests and prosecuting all initiates who had committed crimes, including sexual immorality, murder, the falsification of wills, and perjury (probably connected with false witness to the wills). Over 7,000 people were implicated and many of these were put to death. Two

decrees of the Senate dissolved the current Bacchic associations, prohibiting Roman citizens to become priests and restricting the size of associations to five people or fewer; any associations had to apply to the Senate for approval. One decree survives as an inscription (*ILLRP* 511), supporting Livy's account. The brutality of the suppression of the Bacchanalia was unprecedented, since in the Republic exile was a more usual capital penalty than death. The Senate's motivations remain obscure and have been much debated (e.g., Bauman 1990, Gruen 1990, Takacs 2000). The Bacchic initiates may have represented a political conspiracy or seditious group, threatening the Roman state. Their suppression may have been intended to reinforce sex/gender roles (male initiates underwent sexual penetration, a transgressive act for Roman males) and to reinforce Roman cultural identity. The cultists' murders were perhaps intended to raise money for the cult by falsifying the wills of their murder victims. What is certain is that the Roman Senate in suppressing the cult asserted its right to control Roman religious practices and to dominate Italian affairs. Little other information is available; the circumstantial story of Aebutius and Hispala Faecenia in Livy may derive from a contemporary play.

Modern scholars have argued that foreign cults were prohibited within the *pomerium* (the sacred boundary of Rome). The Great Mother's priests (*galli*) were eunuchs, and the Senate forbade Roman citizens to become eunuchs. However, the pomerial rule has been questioned and the Roman Senate permitted the formal introduction of the cult of Cybele in 206 BCE, and of other non-Roman gods, such as Aesculapius (Greek Asklepios), the god of medicine.

The Roman authorities distrusted and periodically targeted the cults of Isis, Osiris, and Serapis, deities worshipped in Egypt. In 58 BCE, shrines of Isis and other Egyptian deities on the Capitoline hill were destroyed (Tertullian, *Ad Nationes* 1.10). Isis cult associations supported the rabble-rousing tribune Clodius, leading to their disbandment in 53 and 50 BCE. In 50, the authorities destroyed shrines of Isis and Serapis (Valerius Maximus 1.3.4). In 28, BCE Octavian prohibited Egyptian cults within the *pomerium*, and in 21 BCE Agrippa expelled them from the city (Dio 53.2.4, 54.6.6). Tiberius (emperor 14–37 CE) also expelled Egyptian cults (Suetonius, *Tiberius* 36.1). In these instances of persecution of Egyptian cults, the emperors were concerned to reinforce Roman cultural identity. Octavian's propaganda in his civil war against Mark Antony focused on Antony's un-

Roman behavior as the lover of Cleopatra, queen of Egypt. In the empire, greater tolerance prevailed as provincials from around the empire were incorporated into the Roman governing class. The emperors tolerated the cults of Cybele, Isis, Osiris and Serapis; some even patronized them as they would any other pagan cult that was not a threat to the established order.

Druidism, the system of Celtic religious and cultural lore, was suppressed by the Romans in Gaul and Britain (Suetonius, *Claudius* 25.5; Tacitus, *Annals* 14.30), because it served as a focus of resistance to Roman authority. According to Julius Caesar, the Gauls practiced human sacrifice, then regarded as barbaric by the Romans; suppressing it may have justified suppressing the Druids. The Romans frequently destroyed the enemy's sacred sites (temples, shrines, groves) alongside the destruction of enemy cities (the most famous instance is the destruction of the Temple of Jerusalem). However, classical sources speak of the Druids as philosophers, prophets, and magicians. Such (non-Druid) persons were regarded with suspicion and periodically expelled from the city of Rome; they provided an obvious focus for public unrest because they claimed special powers and might predict the death of a magistrate or emperor or a coup or revolt (cf. Tacitus, *Histories* 2.61, 4.54).

Manichaeism, a dualist cult originating in Persia, was persecuted by Diocletian (284–305), as an un-Roman cult and possibly as a political threat during a period of renewed war with the Sassanid Persians.

Cursus Honorum (Imperial)

The *cursus honorum* (sequence of magistracies) for members of the senatorial aristocracy during the Principate (approximately from 18 BCE to 235 CE) consisted of the vigintivirate, laticlavian tribunate, quaestorship, optional aedileship or tribunate of the plebs, and praetorship, followed by various civil or military posts, culminating in the consulship, which was now granted as an imperial honor with little power. Provincial governors might be ex-praetors or ex-consuls. The façade of Roman tradition and continuity with the Republic was thus maintained, but in fact all magistracies were voted by the Senate or appointed by the emperor. In the imperial service, senators were eventually thrust aside by equestrians.

Augustus examined the rolls of the Senate in 28 and 18 BCE, weeding out unsuitable or superfluous members. In 18, he made membership in the Senate require a census qualification of 1,000,000 sesterces (Dio 54.17.3; Suetonius, *Augustus* 41 is in error). He also lowered the age requirement for the quaestorship from 30, which had been the policy of Sulla, to 25. As many senators could not meet the requirement of one million HS, Augustus also adlected (chose to promote) wealthy equestrians to the Senate.

At age 17 the son of a senator could wear the *latus clavus*, the broad-striped tunic. He became eligible for the vigintivirate (Board of Twenty), a group of minor magistrates, of whom three were *tresviri monetales*

(moneyers), 10 were *decemviri stlitibus iudicandis* (judges), four were *quattorviri viarum curandi* (in charge of roads), and three were *tresviri capitales* (in charge of punishment). All these offices were held for one year. Since upper-class education emphasized rhetoric and literature, it is unlikely that the moneyers, the magistrates in charge of roads, and the magistrates in charge of punishment actually managed the day-to-day work; the 10 judges presided over courts, a task for which their rhetorical training had better prepared them.

A senator's son then served as a laticlavian tribune in a legion, one of six tribunes (the other five were equestrian tribunes). He was appointed by the emperor or by the governor of the province in which he served. This *militia* also lasted one year. For many senators' sons, the laticlavian tribunate was their only military experience, in contrast with the senatorial careers of the middle Republic.

A senator's son then, at 25, was eligible to run for the quaestorship, which enabled him to enter the Senate as a senator, which he held for life. There were 20 quaestorships yearly. Quaestors in the Republic had accompanied consuls or praetors on their campaigns, managing logistics and payment for the troops. Quaestors in the empire were more likely to have minor administrative duties as assistants to the consuls and the emperor.

Having served as quaestor, the young senator was required to wait for two years before he could hold another magistracy, the aedileship or the tribunate of the plebs. The tribunate of the plebs no longer represented the interests of the lower classes; the populace regarded the emperor as their protector and appealed to him from unsatisfactory judgments by lower magistrates or provincial governors. The aedile in the Principate retained some of his earlier responsibilities caring for the markets and amenities of the city of Rome. However, the equestrian members of the imperial service had taken over many functions of the quaestors, aediles, and tribunes.

After another two years of required *otium* (inactivity) the senator could run for praetor, a magistracy that also had lost much of its power from the Republic but that was coveted because it was a prerequisite for legionary commands, provincial governorships, and other high-ranking posts in the imperial administration. The number of praetors was insufficient for the number of candidates, and the emperors were forced to increase the number of praetors from eight to 12 a year (Augustan) to 16 (mid-first century) to 18

(late first century).

After the praetorship a senator might be appointed legionary legate or governor. If governor of a public province, he received proconsular rank and was appointed by the Senate; if governor of an imperial province, one with an active military presence, he received the rank of *legatus Augusti pro praetore* and was appointed by the emperor. He might also hold other important administrative posts.

The culmination of the imperial *cursus honorum* was the consulship, now appointed by the emperor as an honor rather than voted on. To disseminate this honor more widely, the number of consuls per year expanded from two to eight or 10 by the late first century and in the Severan period to 12, each pair of consuls serving for two months. The pair of consuls who inaugurated the year were termed *consules ordinarii* or ordinary consuls; they still gave their names to the year as in the Republic, though dating by the year of the emperor's reign also became common. The other consuls were termed *consules suffecti* or supplementary consuls. The *consules ordinarii* were the most prestigious. The emperor might hold a consulship repeatedly. Since the emperor was now commander-in-chief and used provincial governors, legates, and members of the imperial family as field generals, the consuls were not given military commands. They still presided over meetings of the Senate, as well as presiding over games at Rome. They were authorized to govern the city of Rome in the emperor's name in his absence, though the Prefect of the City also took on this role. Governorships following the consulship were most prestigious, topped by the proconsulship of Africa and the proconsulship of Asia.

Senatorial careers are attested both in literary sources and in inscriptions, where the senator's offices and other honors (such as priesthoods) are usually listed in reverse chronological order, starting with his most senior and highest ranking posts and descending to his earliest posts. Both sources favor recording the most distinguished careers. Many senators did not obtain the praetorship and proceed to legionary commands and provincial governorships; some senators' sons possibly did not even enter the Senate, preferring to enter the equestrian career track or to withdraw from political affairs. Withdrawal from politics was a temptation when "bad emperors" persecuted the senatorial aristocracy for suspected sedition. At best, the emperors' patronage and favor was fickle, at worst it was bestowed on persons (equestrian and more lowly) whom senators

considered unworthy.

Cursus Honorum (Republic)

When the monarchy was overthrown and the Republic was established (traditionally 509 BCE), two magistrates, called consuls, were created to take over the kings' administrative, military, and some religious functions. Collegiality was an important principle with republican magistracies: for example, there were always two consuls. Magistrates were annually elected and initially came exclusively from patrician families, for example, wealthy landowners, since there was no payment and they alone could afford the task.

As Rome grew and some plebeians became wealthy, they resented their exclusion and gradually secured admission. Further offices were added: first an urban praetorship (in 367) to supervise justice; in ca. 242 a second praetorship (called *peregrinus*) to deal with lawsuits involving noncitizens. Expansion throughout Italy and then overseas required more magistrates, since it became usual for higher magistrates to govern an overseas province after their year of office in Rome. The number of praetors increased to four in 228/7 and six in 198/7.

The quaestorship was created at the beginning of the Republic: originally two, then four, and gradually more, until Sulla increased their number to 20 (and made them automatically members of the Senate) and Caesar to 40. Earlier they had judicial powers, but later dealt mainly with finance; most were allocated to generals and provincial governors as their

assistants.

Over time an “official” career developed, called the *cursus honorum* (“ladder of office”): quaestorship, praetorship, and consulship. Due to conflicting evidence for the development of the magistracies, it is not really possible to speak of an established *cursus* before the third/second century BCE. Optional offices included the aedileship, held after the quaestorship but before the praetorship; the tribunate of the plebs, after the aedileship but before the praetorship; and censorship, after the consulship. A law, usually dated 180 BCE, set out the steps, though the law probably only re-affirmed conventional practice: the quaestorship was held no younger than 30, the praetorship no younger than 39, and the consulship no younger than 42. One could not move to the next step without having held the previous office, and there were rules about intervals between the same office. Sulla restated this law about ages, as well as increasing the number of quaestors to 20 and praetors to eight. The number of consuls never increased, creating a steeply narrowing pyramid of office, with intense competition for the top magistracies. Very few reached the consulship.

Two magistracies not required in the *cursus* were the aedileship and the tribunate of the plebs, but they were often held because of opportunities for self-advertisement. There were originally two aediles; the patricians added two more, termed curule aediles, exclusive to themselves. Aediles supervised public buildings and games and other infrastructure and amenities of the city of Rome, and in the earlier Republic their office usually brought admission to the Senate.

The tribunate of the plebs was created to protect plebeians from unjust decisions of (usually patrician) magistrates in their struggle for rights. Eventually there were 10 each year; to be eligible candidates had to come from a plebeian family. Since tribunes could initiate legislation and appear as “protectors of the people,” this magistracy was used to seek popular support

A person achieving a magistracy in the first year he was eligible was said to have secured it *suo anno* (“in his own year”). It was difficult to secure a consulship if there was no one from the family who had held that office before, and the first to do so was called a “new man” (*novus homo*).

There were exceptions to the rules, usually in military emergencies. Scipio Africanus, for example, was appointed by the people in 210 to a consular command against the Carthaginians in Spain, though he had been

only aedile, because of his family's military reputation. After his successes Scipio was directly elected consul in 205 to combat Hannibal. Another Scipio, born Aemilius but adopted by Africanus' son (becoming Scipio Aemilianus), was elected by the people direct to a consulship for 147, though he was standing only for the aedileship, to lead another war against Carthage; again the family name played a part. Against all convention, Marius, a "new man," held seven consulships in all, five in succession (104–100), while Pompey moved straight into a consulship for 70 without the previous magistracies and aged only 36. Cicero, consul in 63, achieved a double distinction: he was a "new man" and elected *suo anno*.

The *cursus* continued into the early imperial period, though the ages for office were lowered. There were a larger number of magistracies, but the emperor gained the right to nominate and even appoint candidates. The imperial family dominated the consulship, but a system of "suffect" (supplementary) consulships developed, giving the upper classes more chances at advancement. There were also more opportunities for military command, in both public and imperial provinces. Emperors could use appointment to office as an honor, though such appointments were not simply honorific. Increasingly men of equestrian rank occupied administrative positions, and a separate *cursus* developed for them.

Cynoscephalae, Battle of (197 BCE)

Cynoscephalae was the decisive battle of the Second Macedonian War. In the autumn of 197 BCE, Roman consul Titus Quinctius Flamininus and a Roman army of approximately 32,000 men outflanked and decisively defeated a Macedonian force of 25,500 led by King Philip V. The victory ended Macedonian power in the eastern Mediterranean and proved the superiority of the Roman legion over the Greek phalanx.

Both armies met near the town of Pherae and skirmished without result, but the heavily wooded terrain proved unsuitable for battle. Both sides broke camp and advanced to the west toward the town of Scotusa to secure provisions for themselves. Bad weather, mist, and a range of hills—known as Cynoscephalae—shielded each army’s movement from each other.

Flamininus sent scouts to the summit of the hills to try and locate Philip’s army and met the Macedonian reserve force. Both armies sent reinforcements, and the Macedonians drove the Romans from the hilltop. Both sides then gathered their full strength and charged each other. Philip’s right wing steadily drove back the Roman left, but Flamininus and the Roman right in turn routed the Macedonian left, outflanking the remainder of the phalanx. An unnamed Roman tribune then led 20 maniples into the Macedonian rear, routing Philip’s army. Philip himself escaped, but the Romans were victorious. The Romans lost about 700 men, while killing 8,000 Macedonians and capturing about 5,000 more.

This battle is often regarded as proof of the superiority of the Roman legion over the stalwart, close-formation Greek phalanx. The legion’s flexibility proved the key: its organization into maniples allowed separate units to break off the pursuit of the fleeing Macedonian right wing, wheel around, and take the phalanx in the rear. The phalanx, armed with long spears and designed around a rigid formation, was incapable of reacting to the sudden threat to its rear and disintegrated.

Dacia, Dacians

Occupying roughly the area of modern Romania, pre-Roman Dacia was unified in the first century BCE by the native leader Burebista, and was conquered in the late first and early second centuries CE by Domitian (81–96) and Trajan (98–117) in the Dacian Wars of 85–89 and 101–102 and 105–106. It is the latter two that are commonly termed the First and Second Dacian Wars. Dacia became Rome's only large province north of the Danube and was abandoned during the third-century crisis.

The various peoples collectively termed Dacians occupied the lower Danube basin and Carpathian Mountains (roughly modern Romania). Their cultures were influenced by the Celts. They were first united by the leader Burebista in the mid-first century BCE, who extended his realm into Illyricum, encroaching on Roman territory in Macedonia. After Burebista's death, however, the Dacians fragmented and were not reunified until the reign of King Decebalus in the late first century CE. Renewing Dacian expansion, Decebalus fought and defeated two Roman governors in 85 CE and 86. Domitian (81–96) inflicted a defeat on Decebalus at the Second Battle of Tapae in 88 and then made a peace with Decebalus in 89, establishing him as a client monarch, to free troops for a new war with a coalition of the Suebi and Sarmatians. Trajan (98–117) renewed the Dacian War, conquering Dacia in two wars between 101–102 and 105–106. The native Dacians are rendered in "barbarian" fashion as monumental statues that probably originally adorned the Forum of Trajan and in the reliefs on Trajan's Column.

Dacia was incorporated as a Roman province. Its native capital of Sarmizegetusa, destroyed in Trajan's Dacian Wars, was rebuilt as Ulpia

Traiana, a Roman colony. Many peoples from around the empire settled in Dacia, attracted to the opportunities for mining in the Carpathians and to the cities founded by the Romans. The Roman military presence also promoted urbanization near forts. The immigrants merged with the native Dacians. This makes somewhat implausible the persistence of a “barbarian” Dacian identity, attributed to the emperor Galerius (Caesar 293–305, Augustus 305–311) by Lactantius’ invective (Lactantius *De mortibus persecutorum* 9.2). Dacia itself was abandoned by the emperor Aurelian (270–275) as an indefensible salient; its inhabitants moved south across the Danube to Moesia.

Dacian Wars, Causes

The three wars fought between the Roman Empire and the kingdom of Dacia took place in the reigns of Domitian (81–96 CE) and Trajan (98–117) between 85–89, 101–102, and 105–106. (The last two are usually termed the First and Second Dacian Wars.) The Dacians had raided Roman territory since Caesar, but the sources record causes for the wars rather sketchily. They took sides with Pompey in the civil war with Caesar. Raids followed in the reigns of Augustus and Tiberius.

The Dacians caused the Domitianic War. The Gothic chronicler Jordanes asserts that there had been a long truce until the Dacians broke it by attacking Moesia, motivated by fear of the emperor Domitian’s avarice. Suetonius specifically places the blame on the Dacians for the destruction of a legion and calls the Roman War justified, contrasting it with Domitian’s

unnecessary war against the Germanic Chatti. Dio's notice is particularly brief and neutral: that a very serious war with the Dacians came to be.

Dio is the main source for the First and Second Dacian Wars. He acknowledges that Trajan began both wars, but exonerates him of guilt and favorably contrasts his character and martial abilities with Decebalus, having previously compared Domitian unfavorably to the Dacian king. Dio attributes three motives to Trajan for the First Dacian War: their previous deeds, the expensive Roman subsidies, and the growth of Dacian power and pride. The first motive, referring to the raids, clearly shifts the blame to the Dacians while the second and third directly affronted Roman honor. Dio once again firmly blames the Dacians for the Second War, asserting that King Decebalus was breaking the treaty that ended the First War in several points: collecting arms, withholding Roman deserters, repairing the fortifications of citadels, sending envoys to neighbors and annexing land from the Sarmatian Iazyges to the west.

The deeper causes for the Dacian Wars were expansionism; the desire for victory, *gloria*, or revenge; and economic motives. Rome was a very aggressive state. While the Republic was more aggressive than the empire, some emperors did fight expansionist wars. Trajan was particularly active and ambitious in his wars, fighting both the Dacians, the strongest polity in unconquered Europe, and the Arsacid Empire Rome's only real equal among her neighbors. These were the most extensive additions to the empire since the reign of Augustus and her most dangerous enemies. In addition, Trajan annexed the kingdom of the Nabataean Arabs peaceably as the province of Arabia Felix.

As an expansionist power, Rome expected its leaders to attain victory. The more ambitious emperors sought military renown (*gloria*). Dynastic insecurity quite often played a role in expansionism during the early empire. Trajan, for example, was the first provincial emperor (born in Spain of Roman descent) and was only adopted by Nerva (96–98) after the troops mutinied. He attained both dynastic security and *gloria* through his Dacian and Persian conquests. Doubtless, he sought comparison with Alexander the Great, the great paragon of military prowess in the classical world. Roman honor required revenge after the defeats by the Dacians in the Domitianic War and the disadvantageous treaty.

Lastly, the Romans did sometimes have economic motives for conquest. Dacia was in fact a prosperous kingdom with a partly monetized economy.

The gold mines of the western Carpathians were immediately exploited by the Roman state. Similarly, the Transylvanian plateau was a well-watered and fertile region that could readily support a garrison.

Dacian Wars, Course

The Dacian Wars occurred during the reigns of Domitian (81–96 CE) and Trajan (98–117 CE). While the Domitianic War (85–89 CE) was inconclusive, Trajan's First Dacian War (101–102 CE) and Second Dacian War (105–106 CE) were partial and total Roman victories, respectively. The Second Dacian War led to Roman annexation of the kingdom of Dacia as a Roman province in 106 CE. Roman conflict with Dacia reflected a broader shift in frontier policy in the late first century CE away from the Rhine and toward the Danube. As the Rhine frontier zone became more secure, emperors shifted legions to the Danube to counter the increasing threat of the Dacians and Sarmatians on the Danube.

There are few ancient sources for the Dacian Wars: Dio 67–68, Suetonius' *Life of Domitian*, and Trajan's Column. Trajan's Column is the most detailed source for the First and Second Dacian Wars, but is propagandistic and Romanocentric. No Dacian written sources survive. Archaeological evidence attests major destruction in Dacian citadels, such as Sarmizegetusa Regia, in Trajan's reign.

We know little about Domitian's war against Dacia. Dio uses his account of this war to criticize Domitian and praise Trajan. Although

Domitian took personal command thrice during his Dacian War, the Domitianic battles are mentioned only briefly. Suetonius notes the defeats of Oppius Sabinus in 85 CE and Cornelius Fuscus, commander of the Praetorian Guard, at the First Battle of Tapae in 86 and then summarizes the rest of the war in conjunction with Domitian's campaigns against the Chatti as battles of varying outcomes. This masks Domitian's victory over Decebalus in the Second Battle of Tapae (88 CE) that avenged the earlier defeats. Domitian ended his Dacian War because he needed troops for a war against the Suebi and Sarmatians, and made a treaty with Decebalus that granted payments of subsidies to Dacia and the loan of artisans and architects. The architects rebuilt parts of Dacian citadels in stone, particularly temple foundations. An altar near the *Tropaeum Traiani* lists the names of soldiers who died in the First Dacian War's disasters.

Trajan sought revenge for damaged Roman prestige in his First and Second Dacian Wars, which he conducted in person. He invaded Dacia in 101 CE (the First Dacian War), achieving a swift victory by 102. Trajan pressed forward quickly toward the Carpathian fortresses with strong forces in two columns. The Dacians retreated to higher ground. The Roman columns then reunited and defeated the Dacians. A second Roman victory allowed Trajan to besiege and capture the Dacian fortresses at Costești and Piatra Roșie, recovering the legionary eagle standards lost in Fuscus' defeat. Trajan forced a treaty on Decebalus, requiring the return of Roman deserters and removal of the defenses of the Carpathian fortresses. Decebalus also became a Roman client. Trajan then left behind garrisons.

Decebalus broke the treaty by maintaining his fortifications and large forces. Trajan declared war in winter 105 and won a final victory in 106. Decebalus fiercely attacked the Roman forces protecting the bridge over the Danube at Drobeta, but Trajan rallied his men and defeated the attackers. Once again the emperor divided the army into two and advanced rapidly on the Dacian capital at Sarmizegetusa Regia. The Romans took the citadel by assault with heavy Dacian losses. Decebalus and some warriors fled, but were pursued by Roman auxiliary cavalry. Decebalus killed himself with poison just before the moment of capture. The war ended with the capture or flight of many civilians, though few nobles (*pileati*) survived. Trajan annexed the Dacian kingdom as the province of Dacia under a consular governor in 106 CE. A monument to Trajan's Dacian Wars, the *Tropaeum Traiani*, was erected near Adamklissi.

Dacian Wars, Consequences

The annexation of Dacia caused momentous effects: increased economic exploitation, large-scale colonization, major changes in settlement patterns, linguistic and cultural change, and the relative marginalization of the surviving Dacian population.

The Dacian kings had partly monetarized their economy in the first century CE and fostered commerce and mining, but the Roman economy intensified the scale and volume of economic activity. Gold mining and quarrying for stone expanded considerably. Urbanization provided markets for crops and manufactured goods, both domestic and imported. Lastly, military supply transformed agriculture and pastoralism in scale to sustain the garrison of two legions and numerous auxiliary regiments, almost 50,000 soldiers. In time, prosperous farms (*villae rusticae*) developed, especially near Apulum and Ulpia Traiana Sarmizegetusa. Material goods from the rest of the empire penetrated Dacia thoroughly.

Eutropius notes Dacia's depopulation in 106 and colonization from the whole Roman world. The final panels of Trajan's Column and continuity in settlement in many smaller Dacian sites show the survival of the Dacians. Inscriptions demonstrate significant colonization from the Greek east and Latin west. Major cities, such as Ulpia Traiana Sarmizegetusa, attracted settlers from the Mediterranean. But smaller towns, such as Ampelum and Alburnus Maior, saw immigration from peripheral areas: gold-miners from

rural Dalmatia and settlers from the caravan city of Palmyra. Merchants from Anatolia and Syria migrated for the emerging commercial and industrial expansion. Auxiliary units from Britain, Gaul, Africa, the Danube provinces, Anatolia, and the Levant arrived in the first generation of occupation. Many veterans retired in Dacia. The result was a cosmopolitan mix more diverse than in other provinces on the northern frontier.

The foundation of new cities altered the pattern of settlement in Dacia. While there was significant continuity in many rural sites in the province, most urban sites in Roman Dacia saw a significant break from the Iron Age kingdom. Ulpia Traiana Sarmizegetusa was a new site, 25 miles from the old capital of Sarmizegetusa Regia. The Roman founded cities such as Drobeta, Apulum, and Napoca because of their location on the emerging imperial communications network rather than their proximity to former Dacian villages. The entire pattern of settlement also increased in population density, largely because of the influx of colonists and garrisons.

The most important effect was linguistic and cultural change. Although the Dacian language doubtless endured in rural areas, Latin was the language of the cities and camps. The overwhelming majority of inscriptions in the province are in Latin with a tiny minority in Greek and some Palmyran wax tablets in the gold-mining towns. Only 2 percent of names in inscriptions were Dacian. Latin eventually turned into Romanian, the only major Romance language in eastern Europe. The Roman linguistic influence was thus profound and enduring.

Cultural change, or “romanization” as it was once called, introduced widespread innovations to Dacia. The result was the creation of a new culture neither Roman nor indigenous, similar to other frontier provinces in the Latin west. Many cultural influences entered from throughout the empire, carried by administrators, merchants, and soldiers. In the largest cities, Ulpia Traiana Sarmizegetusa and Apulum, the inhabitants could choose from elements of Roman and other traditions. The imperial synthesis of the Mediterranean core of the empire was strongest here. In smaller towns, there were fewer choices. The countryside engaged little with the imperial culture beyond the incorporation of its basic material goods.

Few Dacians erected Latin inscriptions. This is very atypical of the Latin west. The imperial government generally made efforts to incorporate local elites and those elites embraced the epigraphic culture. Since the Dacian aristocracy mostly fell in the Trajanic wars, the surviving peasants and

shepherds probably languished in rural obscurity with few opportunities to rise into the new imperial elite or to engage much with its emerging culture.

Dalmatia

The Roman province of Dalmatia comprised parts of modern-day Croatia, Bosnia and Herzegovina, Montenegro, and Serbia. Geographically the province occupied almost all the Adriatic eastern coast, and stretched north as far as the Sava valley. The interior of the province was mountainous and more importantly rich in gold, silver, and iron deposits, which is probably what drew the Romans to the region in the first place. The peoples inhabiting the territory of the province were of Illyrian and Pannonian origin, and among them were the Delmatae (after whom the province was named), the Liburni, the Iapodes, the Maezaei, the Daesitiates, the Dindari, the Pirustae, the Ditiones, the Glinditiones, the Melcumani, and the Deuri, in addition to several smaller tribal units. Although this region had been visited sporadically by the Romans since 230 BCE, it was not until the end of the Pannonian revolt (around 8 or 9 CE) that the Roman province of Dalmatia officially came into existence. Dalmatia was created when the previous, larger province of Illyricum was divided into two smaller provinces, Dalmatia and Pannonia, for the purposes of easier control and administration of the region. Initially held secure by two legions in the aftermath of the Pannonian revolt, Dalmatia quickly becomes a peaceful ungarrisoned province, hosting only a small auxiliary force for policing

purposes. Dalmatia was governed by a Roman senator, who bore the official title *legatus Augusti pro praetore provinciae Dalmatiae*, the first of which was Gaius Vibius Postumus. In the later Roman Empire, Dalmatia became famous as the birthplace of several Roman emperors, most notable of which was Diocletian.

Damnatio Memoriae

Damnatio memoriae was the obliteration of an important Roman's public record, including his statues, portraits, inscriptions, family tree, tomb, and other forms of commemoration. It was imposed as a *post mortem* punishment on enemies of the state and on hated and despised rulers. It is most associated with the emperors, but also dates from the late Republic.

Public commemoration was central to Roman elite culture, recording for posterity the exploits of men with distinguished political and military careers. Career inscriptions are the most obvious form of record. Famous men in their lifetimes might dedicate buildings or temples. After their deaths, their relatives held elaborate funerary processions displaying the wax death masks of deceased ancestors. The emperors, belonging to this elite, carried on and expanded the tradition of public commemoration, possessing greater resources to erect monuments and buildings. Senatorial aristocrats continued to hold office in the imperial period and also perpetuated this public culture.

Conversely, the worst punishment imaginable was not death itself, but the destruction of an individual's public record, a *post mortem* punishment termed *damnatio memoriae* by modern scholars (the Romans did not use the term). *Damnatio memoriae* involved a wide range of *post mortem* sanctions, including the official condemnation of the individuals by the Senate; the annulment of their legislation; and the destruction of their public inscriptions and images (portraits and statues). Related sanctions

included the invalidation of their wills, the confiscation of their property, and the denial of a public funeral or public mourning. At worst, the condemned person's body might be desecrated, usually by severing the head and exhibiting it in public; the body might be thrown into a river or sewer. However, there was no one legal institution that combined all these features, and in many instances some but not all these features appear. It was obviously infeasible to destroy all inscriptions and images of an emperor who had reigned for many years.

Though *damnatio memoriae* is most often associated with unpopular emperors, it predates the Principate and was inflicted on Gaius Gracchus (d. 121 BCE; Plutarch, *C. Gracchus* 18) and on Lucius Appuleius Saturninus. It was also inflicted in the Marian-Sullan conflict, and in the Sullan and triumviral proscriptions of 82–81 and 43–42 BCE. In these cases, the *post mortem* condemnation of enemies was due to their status as *hostes publici*, public enemies. Their corpses were left unburied and often decapitated, since individuals who sought rewards for murdering proscribed persons had to provide proof by producing the victim's severed head.

Revulsion against this period motivated the early emperors to moderate *damnatio memoriae*-like policies. Though Mark Antony's statues were destroyed (Plutarch, *Antony* 86.4), Augustus merely refrained from mentioning Antony and other rivals by name in his *Res Gestae*, the monumental inscription recording his career and deeds. Though the Senate condemned Gnaeus Calpurnius Piso *pater*, the treasonous governor of Syria who allegedly murdered Germanicus in 19 CE, it moderated some of the features of condemnation in the surviving *Senatus Consultum de Cn. Pisone patre* (Flower 1998; cf. Tacitus, *Annals* 3.17–18). The Senate confiscated Piso's property, but gave most of it back to his descendants, including Piso's son, who was forced to change his praenomen Gnaeus to Lucius but subsequently had a distinguished career. When the Senate wanted to condemn Caligula's memory, the emperor Claudius dissuaded them (Dio 60.4.5).

As the case of Piso shows, personages other than emperors might also receive *post mortem* condemnation, as did Lucius Aelius Sejanus, Tiberius' Praetorian prefect (Dio 58.11.5). Roman women were also subjected to *damnatio memoriae*, as with Julia the granddaughter of Augustus, convicted for adultery and subversion. In most instances, the consort of a condemned emperor was likely to suffer the same fate.

Subsequently, the Senate imposed *damnatio memoriae* on the hated Domitian (81–96) (Suetonius, *Domitian* 23). In 193, the Senate called for the condemnation of Commodus (*Historia Augusta, Commodus* 18.1–19.9), chanting execrations: “let the memory of the murderer and the gladiator be abolished” (19.1) and “let him be dragged by the hook” (desecrating his corpse). The emperor Caracalla (211–217) imposed *damnatio memoriae* on his younger brother and coruler Geta, whom he assassinated. A famous painting of the Severan imperial family once displayed Septimius Severus, Julia Domna, Caracalla, and Geta; Geta has been blotted out of the painting. The latest definite imperial victim of *damnatio memoriae*-like policies is Maximian (286–305), Diocletian’s coruler, who attempted on his own to regain imperial power after 305 and was defeated and committed suicide (or was forced to do so). After his suicide, his images were destroyed; because Diocletian’s and Maximian’s images had been paired as corulers, Diocletian’s images were also destroyed (Lactantius *De mortibus persecutorum* 42). However, Diocletian’s policies were allowed to stand.

It is unlikely that the statues of deposed emperors and unsuccessful usurpers were always destroyed. Many statues of deposed emperors and usurpers were probably just removed from display; with the rapidly changing fortunes of civil wars, a successor might put them back on display to rehabilitate a previous ruler (Varner 2004; Galinsky 2008).

Danube (River)

With a length of 1,785 miles, the Danube River (Danuvius or Ister) formed the Roman Empire's northern border for the provinces between Raetia in the Alps through Moesia near the Black Sea. The only province north of the Danube was Dacia, added in 106 CE and abandoned in the reign of Aurelian (270–275).

The Danubian provinces, as they are often termed by modern scholars, were added in stages. Rome's conquest of Illyria, the part of the Balkans bordering on the Adriatic Sea, was achieved in the late Republic; conquests in the reign of Augustus (27 BCE–14 CE) extended Illyricum to the Danube. The Romans explored the length of the Danube, disproving the Greek belief that the upper river (Danuvius) as far as the Iron Gate gorge, and the lower river (Ister) flowing into the Black Sea were separate rivers. However, the river's gorges south of modern Belgrade, especially the dramatic gorge known as the Iron Gate, discouraged continuous navigation. Besides the conquest of Dacia, Trajan's army carried out public works at the Iron Gate, building a canal to bypass the gorge, repairing the towpath, and building a bridge across the Danube (*CIL* III 1699 = *ILS* 8267).

The Danube formed the northern boundary for the provinces of Noricum, Pannonia, and Moesia. Pannonia and Moesia were divided into Upper and Lower Pannonia and Upper and Lower Moesia. Legionary bases on the Danube developed into important provincial cities. The Danube was patrolled by two Roman fleets, based in Pannonia and Moesia. Due to the expense and slowness of land transport in antiquity, the Danube River was an important transportation route for the Roman army, for traders, and for Roman emperors and dignitaries traveling through the Danubian provinces. A Roman road bordered the south bank of the Danube from Castra Regina in Raetia to the Black Sea delta.

De Rebus Bellicis

The *de Rebus Bellicis* (“On military matters”) is a Roman military treatise written by an anonymous author in the fourth or very early fifth century. It explicitly states that the emperor Constantine I was dead, placing the date of composition after 337, and tells us that the empire was under severe external threat. Some scholars suggest the battle of Adrianople (378) as the earliest possible date of composition. The unknown author suggests a variety of mechanical weapons and other innovations (such as cattle-powered paddle wheel boats) that could be used to maximize the lethality of Roman military units. He also criticizes the performance of the contemporary Roman army, suggesting poor morale during the final crisis of the Roman Empire. A few of *de Rebus Bellicis*’ more sensible suggestions, such as a padded undergarment (*thoracomachus*) to be worn under body armor, may have already been in practice. The more extravagant weapons and vehicles do not seem to have been implemented.

Debt

Debt was a chronic aspect of the agrarian economy of ancient peasant societies; even the most competent small farmer could lose his crops to a myriad of unforeseen circumstances, and require a subsistence loan to cover the expense feeding his family and procuring seed for the next planting. Unfortunately for the ancient peasant, credit was simultaneously a means of social control as well as an economic mechanism. Social strife rooted in debt was a driving force in the so-called Struggle of the Orders. Early law concerning debt was brutal: in the Twelve Tables (ca. 450 BCE), a creditor after 30 days of default might personally arrest his debtor and imprison

him (Aulus Gellius 20.1). After 60 days, the creditor, having announced his intent on three successive market days, could either sell the debtor into slavery across the Tiber to the Etruscans, or murder him. If there were multiple creditors, then “they shall cut into parts” (*partis secanto*) (XII Tables 3.6). Some scholars have argued that *partis secanto* involved the literal cutting up of the debtor’s body as a deterrent, exemplary punishment, or expression of cruelty; this savagery cannot be ruled out, but more likely *partis secanto* involved the division of the debtor’s property. For all of its harshness, the law of debt in the Twelve Tables may reflect some reforms, given that the law code itself was represented in the sources as a plebeian victory. Debtors were given some procedural guarantees, including the 30 and 60-day grace and probationary periods, as well as the triplicate public announcement of the debt, presumably to allow relatives and friends a chance to redeem the debtor prior to the terrible final consequences. Specific requirements were also laid out mitigating the treatment of the imprisoned debtor, so that his creditor was required to provide minimum rations of one pound of wheat a day (more if he so chose), and to fetter the debtor in no more than 15 pounds of chains (the creditor also had the option of letting the debtor live on his own to save the expense of feeding him).

The annalistic tradition reports various attempts to limit the interest rate on loans during the fourth century BCE, capping interest at first 8 1/3 in 357 and then 4 1/6 in 347, but these measures were likely temporary and ineffective (a rate of 8 1/3 had already been defined in the Twelve Tables, a rule that seems to have been ignored).

A more significant reform came in 326 (or 313) with the passage of the *lex Poetelia*, which banned a form of indentured servitude known as *nexum*, in which a debtor contracted up front to labor for the creditor for a fixed period in exchange for a loan; the indentured labor of children might also be pledged as a form of repayment. The story in Livy (8.28) about a handsome youth being imprisoned for debt and then sexually abused by his creditor is almost surely fiction, given the parallels with the Rape of Lucretia and Appius Claudius’ outrages against Verginia, but it nonetheless continues a Roman historiographical tradition of attributing political reform as a response to sexual misconduct (which in turn symbolizes and embodies broader political inequity). As a practical measure, the *lex Poetelia* was probably connected with the renewal of hostilities with the Samnites (the so-called Second Samnite War), and the anticipated need for military

manpower. Poor citizens were more useful as soldiers than as debt bondsmen. The increasing influx of chattel slaves from foreign wars may have also convinced the elite that they could do without the indentured labor of citizen *nexi*.

Debt continued to be a source of social tension, and is listed as a motive behind the final succession of the plebs in 287 BCE. While the *lex Poetelia* banned a specific form of contracted indentured servitude, private imprisonment for debt (either owing to a defaulted loan or a tort action) continued. In 215, there were roughly 6,000 adult male citizens imprisoned in chains (*addicti*), for debt who were freed by a consular edict to fight against Hannibal (Livy 23.14; Valerius Maximus 7.6.1). While we hear no more of debtors killed or sold into chattel slavery (these actions may have also been banned by the *lex Poetelia*), they still could be held a state of servitude until they either worked off the debt or produced the money. The early imperial agricultural writer Columella (*On Farming* 1.3) refers to the practice of farming land with the “bondage of citizens” (*nexu civium*; n.b. the use of the archaic term). Hadrian banned the imprisonment of free men in workhouses (*ergastula*), a measure attesting to the enduring nature of the problem of predatory lending in the ancient world, and one that was likely limited in its effectiveness.

The ultimate solution to the ongoing debt crisis in the early Republic was conquest, as the distribution of land and plunder propped up the economic fortunes of the peasant class, breaking the structural cycle of debt, default, and dispossession that chronically menaced the small-landowner. Indeed, the temporary solution created by the *lex Poetelia* and associated reforms spawned a virtuous cycle, in which citizens increasingly possessed the economic ability to serve as *assidui* (and were perhaps more willing to fight and die for the *res publica* with the mitigation of internal oppression), providing the manpower for successful conquest, which in turn provided additional resources for distribution. The end of colonization activities in Italy in the 170s BCE led to a return of the vicious cycle, exacerbated by predatory behavior of large-landowners employing chattel-slaves obtained from overseas conquest, leading to renewed social crisis centered on poverty and debt that underlay much of the political violence of the late Republic.

Decebalus (Reigned 80s–106 CE)

Decebalus was the last king of Dacia before the Roman conquest. He fought three wars against Rome: winning victories against the generals of Domitian (85–89 CE) and a partial and later total defeat against Trajan (101–102 and 105–106 CE). Though Decebalus' Dacia was smaller and more homogeneous than Burebista's multiethnic empire, it was the strongest and most sophisticated state north of the Danube in its day. Cassius Dio (Books 67–68) is the main source for the reign of Decebalus, focusing almost entirely on the Dacian Wars. Jordanes (76–78) describes the war against Domitian, but omits Decebalus and Trajan's Dacian Wars. Trajan's column provides a pictorial record of Trajan's Dacian Wars from a Roman perspective. There are no Dacian sources.

Decebalus ruled a sizable kingdom in eastern Europe. Its extent is unclear though in all likelihood was similar to that of the later Roman province of Dacia, encompassing most of western Romania. The capital was Sarmizegetusa Regia that boasted many limestone temples, tower dwellings, and terraced agriculture. There were several other fortified citadels in the nearby mountains that played an important role also, including the former capital of Costești. They formed a concentric ring around Sarmizegetusa.

Dio's characterization of Decebalus (67.6) reflects his own political bias as a senatorial historian as much as the king's character. He praises Decebalus strongly in comparison to Domitian, whose despotism he deplores, but emphasizes the strength and nobility of Trajan by contrast to Decebalus' fear. According to Dio, Decebalus exhibited great military

prowess. He was versatile in attack and defense, skillful both in victory and defeat and was, all in all, an enemy worthy of the Romans.

Decebalus caused the war against Domitian (85–89 CE) by raiding Roman territory. When Domitian sent armies against him, he defeated them, first the governor of Moesia, Oppius Sabinus, and then a force of picked troops led by Cornelius Fuscus, the praetorian prefect. Both died in battle. Domitian himself took command of the army and inflicted a defeat on the Dacians at Tapae (88), but made a compromise peace with a still vigorous Decebalus. At this time, Domitian faced incursions by the German tribesmen in Pannonia and unrest in Rome. It was easier to pay Decebalus off and treat him as a Roman client than to wage war on at least two fronts.

Trajan attacked Dacia in 101 CE to avenge Roman honor. He won a swift victory, recaptured Fuscus' lost standards, and forced Decebalus into submission within a year. Decebalus rearmed his forces and protected Roman deserters, causing Trajan to declare war again in 105. Decebalus held Sarmizegetusa Regia under siege for a time, but fled after its fall and committed suicide when Roman soldiers were closing in to capture him.

Decemvirate

The Decemvirate was a special commission of 10 men (*decem viri*) formed to formulate a code of laws for Rome in 451 BCE, which attempted to seize power in 450 and was overthrown. Prior to the Decemvirate, the Romans (according to later tradition) lacked a formal legal code and relied on custom.

The Decemvirs formed a special college with consular powers, the other magistracies being suspended during their tenure, and were not restricted by *provocatio* (the right of a Roman citizen to appeal the action of a

magistrate). The decemvirs drew up 10 of the XII Tables (Twelve Tables), Rome's most ancient law code. The XII Tables are reconstructed from citations by later Latin authors. They represent a relatively primitive society in which the "eye for an eye" principle still prevailed: as punishment for bodily harm, similar harm could be inflicted on the offender. Debt bondage (*nexum*), in which a debtor unable to pay a creditor became the slave of the creditor, is another institution attested in the XII Tables that was later abolished. The XII Tables represent a period of superstition when witchcraft (if that is what *occentare* means, "chanting" a spell) could be a crime. Classical Roman law, from the last century BCE and reaching its height in the second and early third centuries CE, was more rationally based and more humane.

A second Board of Ten was appointed for 450 BCE to enact two more tables, completing the XII Tables. According to legend, these decemvirs became more and more arrogant, led by the decemvir patrician Appius Claudius, and refused to relinquish their powers at the end of their term. Appius Claudius intended to seduce the plebeian virgin girl Verginia, forcing one of his clients to claim her as his slave. Verginia's father and her intended husband Icilius sued, but Appius Claudius himself was the judge and decided in favor of his client. Rather than surrender Verginia to Appius Claudius, Verginia's father killed her to save her from dishonor. The injustice and tragic death inflamed the Roman *plebs* against the patrician Decemvirs.

Revolting against the decemvirs, the Roman plebs seceded, meeting on the Aventine, and overthrew the decemvirs. Normal magistracies were restored, and Appius Claudius committed suicide (Cicero, *Republic* 2.61–63; Livy 3.33–58; Dionysius *Roman History* 10.54–11.46; Juvenal *Satires* 3.44–48). The dramatic story of Appius Claudius and Verginia has been doubted by modern historians, who see it as repeating "typical" motifs about tyrants (cf. Sextus Tarquinius, Lucretia, and the fall of the monarchy). However, the conflict of patricians and plebeians reached a head in the period of the Decemvirate and would not be resolved till the next century (367 BCE).

Decius (Emperor) (d. 251 CE)

Gaius Messius Quintus Decius reigned as Roman emperor from 249 to 251 AD, and ambitiously took the additional name “Trajan.” Hailing from an old senatorial family, he distinguished himself militarily as well. He usurped the throne from Philip Arabus following a successful campaign in the Balkans. But domestic and foreign insurrections plagued his reign, which ended with his inglorious defeat and death (along with his eldest son) at the hands of Goth invaders, led by Cniva (or Kniva). Decius’ domestic policies were aggressively conservative, and his command that all the empire’s inhabitants sacrifice to the gods prompted the first empire-wide persecution of the Christian church. Unreliable Latin sources allege that Decius vowed his death in battle to the gods in the manner of the *devotio* of Publius Decius Mus in the Samnite Wars.

Decius Mus, Publius

Publius Decius Mus is the name of three generations of Roman nobles, who allegedly sacrificed themselves at the hands of the enemy in battle, the

practice called *devotio*, in the Samnite Wars period.

The elder Publius Decius Mus served as a military tribune in the First Samnite War (ca. 343–341 BCE) and subsequently obtained the consulship in 340 BCE. Campaigning against the Latins, he elaborated upon the obscure Italian ritual of *devotio*, plunging into the enemy ranks, having first dedicated himself to the gods of the underworld in return for victory. The ritual of *devotio* was repeated by his son, also Publius Decius Mus, in the Third Samnite War at the battle of Sentinum in 295 BCE. His son in turn, a third Publius Decius Mus, died fighting against Pyrrhus in 279 BCE, although there is no evidence that this occurred in the specific religious context of a *devotio*.

The cognomen *Mus* means “mouse.” Many traditional Latin cognomina were belittling, tending to ridicule the owners. There was also an Aulus Sempronius Musca (“Fly”).

Decurion

A decurion (Latin *decurio*) was a low-ranking cavalry officer, originating in the Roman Republic. According to Polybius, each thirty-man *turma* of cavalrymen elected three decurions, with the first elected commanding the entire unit. The name derives from the division of the *turma* into three squads of 10 (*decem*) men, perhaps facilitating a deployment into three ranks of 10 files. Each decurion appointed an *optio* (Polybius calls these *ouragoi*, file closers) to serve as a second-in-command. In Polybius’ schema,

decurions were essentially centurions for the cavalry, although they seem to have lacked some of the prerogatives of centurions. There was, for example, neither a decurion equivalent to the *primus pilus* centurion, nor evidence that they received more pay than ordinary cavalrymen.

The title continued to describe cavalry officers during the empire, although each *turma* by then had only one decurion, who was appointed rather than elected: for example, Trajan promoted the Roman cavalryman Tiberius Claudius Maximus to decurion for his capture and decapitation of the Dacian king Decebalus. The imperial decurion was assisted by a *duplicarius* and *sesquiplicarius* (double-pay and one-and-a-half pay men), who filled the roles of the subordinate decurions of the Republic. The senior decurion of an imperial cavalry cohort was the *decurio princeps*. It was not unheard of for a man to serve as a decurion in a cavalry unit prior to promotion to centurion in the legions.

The term decurion also applied to town councilors in *coloniae* and *municipia*, another instance of the Roman tendency to use the same term for multiple institutions. However, the *ordo decurionum* or decurion order (also termed *curiales*) of the Principate and later Empire was entirely civilian, a class of local aristocrats with certain legal privileges who ran for municipal office. They were expected to pay extensive fees for office-holding and fund amenities for their towns, such as games, festivals, and baths. As a result, in the economic downturn of the late second century CE onward, many decurions abandoned office and left their cities. The later Roman emperors increasingly made decurion status and office-holding compulsory.

Dediticii

Dediticii (sg. *dediticius*) were captive people who had undergone unconditional surrender (*deditio in fidem*) to Rome and who were granted mercy. The emperor Caracalla's grant of Roman citizenship to all subjects of the empire did not grant the citizenship to *dediticii*. Especially in the later Roman Empire, they might be settled within the bounds of the empire and obligated to provide troops.

Deditio (Surrender)

Deditio (and its fuller formulations, *deditio in fidem*, *deditio in potestatem*, and *deditio in dicionem* [sc. *populi Romani*]) was the term used by the Romans to describe the abject and total surrender of another state—people, infrastructure, possessions, and territory—to Rome through its representative (usually a consular or praetorian general). Livy suggests that the *deditio* ritual was very ancient; it first appears in his narrative during the reign of Tarquinius Priscus (616–579 BCE), where the precise verbal exchange between the Roman king and representatives of the surrendered state of Sabine Collatia is allegedly recorded (1.38.1–2). An inscription from Alcántara, Spain, dated to 104 BCE, recording the *deditio* of the Seanoc[enses?], indicates that the *deditio* formula had not changed much in the interim.

The different formulations the sources use to describe *deditio* (whether *in fidem*, *in potestatem*, or *in dicionem*) probably mean the same thing, and do not indicate any qualitative difference in terms of how the Romans treated the surrendered party. Indications to the contrary (e.g., Valerius Maximus 6.5.1; Livy 39.54.6–7) are contradicted by Polybius, who writes,

“among the Romans, surrendering to the good faith [i.e., *deditio in fidem*] has the same force as granting the decision about oneself to the conqueror [i.e., *deditio in potestatem*, *deditio in dicionem*]” (20.9.12). The latter passage occurs in the context of the Roman negotiations with the Aetolian League in 191 BCE (Polybius 20.9–10; Livy 36.27–29), when the League representatives alleged to be confused over the nature of Roman *deditio*, and tried to parse the different formulations to their own diplomatic advantage. The Greeks had their own indigenous version of *deditio*, and so were not as unfamiliar with it as the Aetolians alleged.

There were two circumstances under which foreign states performed *deditio* to Roman generals: either voluntarily to activate Roman protection or to avert a Roman attack, or under duress after a military defeat by Rome. Regardless of circumstances, however, the outcomes of *deditio* were the same: during the procedure, the surrendering state temporarily ceased to exist as an entity (although its representatives continued to have official standing); during and after the procedure, the state had a claim on Roman *fides* (good faith and protection); and, should the *deditio* be successful, the state would become a friend of the Roman people (*amicus populi Romani*). Occasionally, a treaty would follow.

It is controversial whether the *ius gentium* (“the law of nations”) compelled the Romans to merciful treatment of surrendered peoples (*dediticii*); after all, it was the prerogative of the general receiving the surrender to do as he wished with the *dediticii*, up to and including enslaving them and destroying their city. However, the centrality of *fides* in the *deditio* ritual, plus the facts that if a general wanted to destroy a city he could simply refuse an offer of *deditio*, and Roman betrayals of their *fides* after *deditiones* are relatively rare all indicate that the normative response to an offer and successful performance of *deditio* was mercy on the part of the Romans, regardless of the circumstances under which the *deditio* was offered (i.e., voluntarily or under duress).

Deductio

Deductio was the formal foundation of a Roman citizen colony. In the Republic, the colonists were usually veterans and their families. The site was usually strategic, intended to help hold down a newly conquered area. The land was demarcated and surveyed, a process known as centuriation. The early *coloniae* had several hundred colonists each; later *coloniae*, in the late Republic, were larger. The practice of settling veterans on *coloniae* disappeared in the early empire, because veterans did not want to move away from the regions near the bases where they had served (Tacitus, *Annals* 14.27). As part of *deductio*, the new cities received charters prescribing Roman-type magistrates and by-laws. An instance from the Colonia Iulia Genetiva at Urso, Spain has survived, inscribed on bronze tablets (*CIL* II 5439, the *Tabula Ursonensis*, of Caesarian date). Such documents show that the new city had two chief magistrates (*duumviri*) and aediles, assistants for the magistrates, public priests, and decurions (city councilors). *Coloniae* were not independent city states in that they could not make war on their own behalf; the inhabitants, as Roman citizens, might be called out to defend the region if attacked.

Demography

Demography is the study of human populations and their change over time: the size of the population; its geographical distribution; distribution over the human lifespan (known as age structure); mortality and fertility rates; the age at which men and women marry, and other metrics. Demography constrains the ability of a population to mobilize for war, contributing manpower and taxes to support government and armies.

Ancient demography is a particularly difficult discipline due to the lack of modern population statistics. Demographic reconstructions thus often use statistical models and comparative evidence. In the Republic, the Roman censors enacted a census of the citizen population, recording age, gender, and property. The census was held ideally every five years, intended to provide information for taxation and recruitment and for regulating the voting structure of the Republic, which assigned voting privileges according to property qualifications. However, much is not known about the criteria for the census. In the chaotic conditions of the last century of the Republic, the census often lapsed. Augustus revived the practice, but the census figures recorded in ancient authors are inconsistent and have generated much scholarly debate.

Censuses were taken in the empire for taxation purposes, since recruitment was now voluntary and voting was no longer relevant. The censuses varied from one province to another. From Roman Egypt many documents recording the “house-to-house census” survive on papyrus, which enable reconstruction of the demography of second- and early third-century CE Roman Egypt (mostly in the Fayûm Depression, a highly settled agricultural area). All provincial censuses fell into abeyance in the third-century crisis. The emperor Diocletian (284–305) and his successors revived the census and attempted to make it more uniform, but actual documents do not usually survive.

The Roman Empire at its height (first and second centuries CE) had a population of approximately 50 million to 60 million, unevenly distributed. The western empire was less urbanized and more sparsely settled, with about half the population of the eastern empire. Accordingly, Germanic invasions in the 160s–170s CE, the third century, and the late fourth and fifth centuries CE had a more harmful effect on the smaller western population. A long-term cause of the decline and fall of the western empire was thus that it was always more sparsely inhabited and less able to support recruitment and taxation.

Like other premodern societies, the Roman Empire had a bottom-heavy age structure, with a large proportion of children and young people, caused by a high birth rate (high fertility). Methods of contraception (various mechanical and chemical barriers) existed but were probably ineffective. There were probably not as many children and young people as in modern developing nations because of the high death rate (high mortality). The average life expectancy at birth was low, between 20 and 30. This does not mean that citizens of the empire aged twice as rapidly than modern people and were considered old at 30. The figure is an average, reflecting very high mortality in infancy and early childhood. Individuals who survived childhood might expect to live into their 50s or 60s. Mortality, however, was not uniform. The mortality rate of major urban populations was higher, especially in Rome, and the mortality of the lower strata was probably high. The mortality rates of the Roman emperors are unusually high for elites, reflecting the danger of assassination. Senators in the early empire show a similar pattern, reflecting early imperial treason trials.

The recruitment patterns of the republican army reflected this pattern of mortality. Young men were eligible at age 17 (reflecting relatively delayed puberty, a consequence of inadequate nutrition). They were liable to service until 60, but the most vigorous men (*iuniores*) were aged 17–46 and in practice only men aged 17–46 were called up. The extension of service in the Principate suggests a similar expectation of life. Legionaries served 16 to 20 years in the reigns of Augustus and Tiberius, and by the late first century CE, 25 years; auxiliaries served 25 years, fleet soldiers 26 to 28 years. A soldier who was recruited at 17–20 would thus be discharged at 40 to 45 years of age. When Tiberius extended legionary service to avoid paying veteran pensions, the soldiers resented this policy and, in the mutinies of 14 CE, indignantly displayed their gray hair and missing teeth. The Tiberian policy

suggests a rudimentary consciousness of age-related mortality: the pool of veterans of the same age who required pensions would be smaller at age 50 than at 45. However, centurions often served for many years, including years beyond the normal discharge date for common soldiers. Centurions' experience was highly valued; Roman society respected age when it correlated with status (cf. the Senate, senator meaning "elder").

A major controversy in Roman demographic studies concerns the demography of Roman Italy in the late Republic and its effects on politics and military manpower. Arnold J. Toynbee in his classic work *Hannibal's Legacy* argued that the Second Punic War devastated and depopulated many areas of Italy, resulting in poor men losing their farms and moving to the city of Rome, where they became *proletarii*, landless men dependent on work for hire. This process was exacerbated by the growth of very wealthy landowners who bought up the depopulated land and became even wealthier through plantation slavery. Ancient authors such as Plutarch and Appian depict the landless poor as a source of social conflict, exploited by tribunes of the plebs (beginning with Tiberius Gracchus) and by generals (beginning with Gaius Marius) who recruited and paid them, creating armies of loyal soldier-clients. The *populares*, Roman politicians (many of them tribunes of the plebs) who courted the support of the poor, also exploited the loyalty of landless men. Both warlords and *populares* contributed to the fall of the Republic.

This bleak demographic picture was supported by Peter Brunt's *Italian Manpower 225 B.C.–A.D. 14* (1971, rev. ed. 1987) and has been more recently supported by Luuk de Ligt (de Ligt 2012). It has the advantage of assuming our literary informants to be correct in perceiving widespread citizen poverty and a shortage of manpower, Tiberius Gracchus and his brother Gaius challenged the Senate and oligarchy (and were killed in doing so). However, the debate continues because it depends on the controversial interpretation of military strength and census figures from the late Republic, as well as more recent archaeological studies. Many areas of second century BCE Italy were not depopulated, and some areas populated by small farmers even underwent economic growth. Nathan Rosenstein (Rosenstein 2004) argues that impoverishment of poor farmers could have occurred not because of depopulation, but due to a population increase, resulting in the survival of more children and thus impoverishment due to the partition of inheritances (Roman estates were divided among all living children). Other

Roman economic historians have recently supported a “high” population hypothesis for the late Republic.

The population of the empire was severely impacted by the epidemic known as the Antonine plague (ca. 165–180 CE), brought back by the Roman army from the Near East during Lucius Verus’ campaign against the Persians. The disease (like many premodern epidemics) is unidentified but may have been measles or smallpox. The decline in population weakened the imperial economy and contributed to political instability in the late second and third centuries CE. Another plague, possibly smallpox or bubonic, also decimated the population in the 250s–270 CE. The long-term effect of these epidemics could have contributed to the fall of the western Roman Empire; however, high fertility rates meant that the population may have recovered rapidly, and archaeological evidence suggests that many areas of the empire in the fourth century were settled and prosperous. However, instability in the fifth century, as parts of the western empire were lost to the Germanic invasions, decreased the effective population of the western empire and thus the western empire’s tax revenues and manpower.

Deposita ad Signa

Imperial Roman soldiers' pay was deposited in a savings bank (probably a box or chest) kept in the shrine where the unit's standards (*signa*) were kept. Such funds were termed the *deposita ad signa*. The sacred nature of the shrine (located in the *principia*, the unit's headquarters) and the standards provided some protection against theft. However, after the revolt of Antonius Saturninus, who stole the *deposita ad signa* of his legions in Upper Germany to pay his supporters, the emperor Domitian set an upper limit to the *deposita ad signa*.

Deprecatio

A plea for mercy expressed by enemies of Rome who confessed defeat and sought peace with the Romans. The enemies were expected to humble themselves and display submissiveness; if they did so, they might be treated with *clementia* (mercy). Unhumbled enemies were likely to be treated harshly. *Deprecatio* is distinct from formal surrender into Roman power (*deditio in fidem*).

Deprecatio is a stock motif in triumphal art (e.g., on historic monuments such as the Column of Trajan). Representatives of the enemy approach the victorious general and kneel at his feet.

Desertion

Desertion has plagued armies in all ages, but in particular armies in premodern societies without effective police forces, systematic proofs of identity, and rapid transport and communications. The Roman army frequently campaigned in undeveloped regions where it was easy for deserters to escape into the wilderness. Despite the benefits of service and the moral censure and severe punishment of desertion, the Roman army found it difficult to prevent desertion.

Desertion was allegedly punished harshly during the early and middle Republic. According to the early imperial author Valerius Maximus, after the battle of Zama (202 BCE), Scipio Africanus, regarding desertion as worse in Roman soldiers, crucified Roman deserters and beheaded allied deserters (Valerius Maximus 2.7.12). Other commanders regarded allied deserters as deserving harsher punishment: Aemilius Paullus, victor of the battle of Pydna (168 BCE), had allied deserters trampled by elephants (Valerius Maximus 2.7.14); and Scipio Aemilianus, victor of the Third Punic War (149–146 BCE), had allied deserters thrown to wild beasts (Valerius Maximus 2.7.13). However, Valerius Maximus chose these anecdotes to illustrate the severity of ancient military discipline. Other anecdotes suggest that commanders of the mid-Republic might choose to shame deserters rather than kill them, for instance by forcing deserters to pitch their tents outside the walls of a military camp and feeding them on barley, regarded as animal fodder.

During the Republic, conscription may have made service unwelcome at least for some wars, such as the Spanish wars (150s–133 BCE). In the late Republic and empire, more soldiers were recruited as volunteers; when

Marius enrolled the landless, many soldiers chose service over an impoverished civilian life. Military service provided financial security and the prospects of plunder and donatives. In the Principate, the greatest inducements to prevent desertion were regular pay and donatives and the prospect of veteran benefits at the end of service—a cash pension for legionaries and the Roman citizenship for non-Roman auxiliaries. A soldier lost the prospect of these rewards if he deserted, as an emperor had to remind a soldier who returned from desertion in one legal instance.

Some degree of conscription continued in the Principate, and military service, especially for ordinary legionaries and auxiliaries on the frontiers, entailed repetitive duties, hard work, potential danger, and potential harsh punishment, all of which might motivate men to desert. The transfer of a legion or auxiliary unit might also motivate soldiers to desert, especially if their unit had been stationed in one place for a long time and the men had extensive ties with the local community. Soldiers also must have not welcomed the advent of a commander-in-chief or local commander with harsh ideas of discipline, such as Augustus and Tiberius, who both revived “ancient” punishments; Galba, who decimated a unit of fleet soldiers; or Domitius Corbulo, who executed even first-time deserters.

Nonetheless, legal sources from the late second and early third centuries CE and law codes from the fourth and fifth centuries CE show the Roman army’s attempts to cope with desertion. Desertion in wartime, to the enemy, or from the line of battle, was in theory punished very harshly (usually with death). But in peacetime, lest the fear of harsh punishment induce soldiers to desert, the emperors and jurists devised a more lenient policy toward men absent without leave (termed *emansores*). From the jurists’ opinions and rulings, absence without leave, such as overstaying furlough or returning late from detached duty, could arise due to extenuating circumstances, such as delay during travel, sickness, or even family issues. The jurists advised commanders to take into account these circumstances in judging whether a soldier was absent without leave or a deserter. The soldier absent without leave had to prove that he had permission to leave and that his return was unavoidably delayed; he might show paperwork, such as the petitions for furlough and passes that are attested. He had to prove that he did not intend to desert; his overall record was taken into account. If he was judged a deserter, in peacetime he might merely be punished with demotion in rank or service.

The Severan jurists' and emperors' rulings have been interpreted as showing leniency and favoritism toward the army. But these rulings may also have been intended to promote recruitment and discourage losses to desertion at a time with increased manpower demand due to the Marcomannic War, the Antonine plague, and the Severan civil wars.

Deserters might become bandits or brigands, or conceal themselves in a large city such as Rome or Alexandria. They might even be able to conceal their identity and enlist again elsewhere in a society in which proofs of identity, such as certificates of birth, were not widely used. Soldiers were identified by their names, units, distinguishing marks, and dates of enlistment, but it might be easy for a deserter without distinctive scars or other physical marks to claim another name and volunteer at another location.

Increasing use of conscription in the later Roman Empire (from Diocletian onward) may have made military service more unwelcome and desertion more frequent. Landowners were required to produce a certain number of recruits as a tax, the *aurum tironicum*, though it was often commuted to a monetary payment. The sons of soldiers and veterans were also required to serve in the army. Later Roman authors, especially Christian authors, suggest that military service had become unpopular. Legal sources show that recruits were tattooed (a practice previously used on slaves) to discourage desertion; the punishment of deserters became more brutal. However, the recruitment of "warlike peoples" (recently conquered or traditionally warlike) may have produced more willing recruits.

Military desertion (often motivated by fear of punishment) must be distinguished from political desertion, which occurred during the late Republic's and empire's civil wars and was not punished. Soldiers merely switched sides from one commander to another, retaking their military oaths.

Devotio

A rare vow taken by a Roman Republican general or soldier preceding a battle to dedicate his own and his enemies' lives to the gods in exchange for a Roman victory. This vow illustrates the Roman belief that the gods influenced military success. According to Livy, Publius Decius Mus, his son, and grandson of the same name took such vows in 340, 295, and 279 BCE, respectively. In the *devotio* of 340 BCE, Decius' prayer specified that he and the Latins, his enemies, were now sacred to the *di manes* (spirits of the dead) and to Tellus (goddess of the earth). Decius then rode into battle to meet his death willingly. According to Livy, Decius' self-sacrifice assured Roman victory.

In place of the general, any soldier could be dedicated to the infernal gods. If the soldier lived while the Romans achieved victory, then the Romans buried a seven-foot image of the man to fulfill the vow. Entire cities could also undergo *devotio*. During the Third Punic War (149–146 BCE), the Roman general Publius Cornelius Scipio Aemilianus devoted the city of Carthage to the gods of the underworld and the *di manes*, the spirits of the dead. These *devotiones* of others bear a close resemblance to human sacrifice.

Whether a commander or soldier devoted himself or *devotio* was imposed on another, these rituals were isolated, emergency measures taken in desperate military situations during the Roman Republic. Nonetheless, they illustrate that a Roman general sometimes placed victory in battle at a higher premium than his own life.

Dictator

In the Roman Republic, a dictator was not a military strongman, but rather an official magistrate of the republic. Although the dictator appears to have been an annual magistrate in some Latin towns, he was appointed only in times of crisis or emergency in Rome. At such times, one of the consuls, on the advice of the Senate, might appoint a dictator, also known as the Master of the People (*magister populi*), specifically to act as the sole commander of the Roman army. Dictators were almost always former consuls. In a nocturnal rite, the dictator received *maximum imperium*, to which all other magistrates of the Republic became subject. The degree to which the right of appeal and the tribunician veto were suspended under the dictator is debatable, though our sources claim it was complete, even as they show exceptions. Upon assuming office, the dictator named a deputy for himself, the Master of the Horse (*magister equitum*). The dictator was attended by 24 lictors (ritual attendants), twice the number allotted to each consul, and received several insignia of the ancient kings, all of which symbolized his supreme *imperium*. His *imperium*, however, was strictly limited in time: he was appointed for six months, or the duration of the crisis, whichever was shorter.

The dictatorship was primarily a response to a military crisis, and as such many dictators appear in the fifth century BCE, when Rome was regularly at war with one or more of its neighbors. Crises besides military defeats, though, could prompt the appointment of a dictator, particularly in the late third century. The *Fasti Capitolini* identify 81 dictators down to 202 BCE, of whom 56 were appointed to take command of the army during a military emergency (*rei gerendae causa*). Most of the remaining dictators were appointed to perform duties that the incumbent consuls were unable

to undertake, due to absence from the city or even death, usually to conduct consular elections (*comitiorum habendorum caussa*).

During the Second Punic War, the dictatorship began to decline in importance and, most likely, power. Thus, Quintus Fabius Maximus Cunctator was elected rather than appointed to the dictatorship in 217 BCE and put up with the elevation of his Master of the Horse, who had been chosen for him, to the status of codictator, as it were. The consuls appointed eight dictators in the following 15 years, but only the defeat at Cannae elicited a dictator who took charge of the army; the other seven performed civic tasks in the absence of the consuls. During this period, the citizen's right of appeal against the dictator and the tribunician veto, if they had been suspended under the dictatorship in earlier centuries, were restored. Following the Second Punic War, Rome abandoned the dictatorship for over a century.

Two reasons immediately suggest themselves for the absence of dictators after 202 BCE. Though some ancient and modern authors have claimed that there was no right of *provocatio* against a dictator (Livy 4.13–14, 8.33–35; most recently, Drogula 2015), the Livian incidents are intentionally dramatic. If there was in practice the right of appeal against the dictator and the possibility of the tribunician veto, these rendered a dictator's *imperium* little different that of the consuls. The dictator retained absolute *imperium* in military matters, but with most of Italy subject to Rome, a military defeat no longer threatened Rome with imminent danger. Moreover, as Roman armies operated further afield, a six-month dictatorship was impractical if an army were operating in, for example, Asia or even Spain, and there increasingly less need and less willingness to entrust absolute power to a single man. Prorogation was employed instead to assign provinces to governors as proconsuls or propraeors.

The dictatorship reappears in the first century BCE after a 120-year hiatus in a very different form. In 82, Sulla was appointed dictator to make laws and reform the constitution (*legibus faciendis et reipublicae constituendae caussa*); such a mandate was unique for a dictator. The citizen's appeal and the tribunician veto were again overridden by dictatorial *imperium*, which, coupled with Sulla's methods during and even before his appointment gave the office a despotic connotation. This most likely influenced Pompey's refusal of the dictatorship in 52 to suppress civic violence (*seditionis sedendae caussa*), believing that he would be less autocratic as that year's

only consul. Caesar's dictatorships between 49 and 44 BCE (that of 44 *in perpetuum*) added further opprobrium to the office, such that Augustus emotionally refused it when offered in 22 BCE.

Didius Julianus (Emperor) (193 CE)

A short-lived Roman emperor (193 CE), Marcus Didius Severus Julianus served as governor of Germany and Africa under Marcus Aurelius and Commodus. When the emperor Pertinax was murdered in March 193 CE, the praetorians held an auction of the imperial office, granting the empire to the highest bidder. The two bidders were Julianus and Flavius Sulpicianus, Pertinax' father-in-law. Julianus promised 25,000 sesterces to each member of the Praetorian Guard and won the purple. His reign lasted less than three months, after Septimius Severus, governor of Pannonia Superior, marched on Italy. On June 1, the Senate declared Severus emperor, condemning Julianus to death the following day.

Dilectus

The *dilectus* was the Roman levy of soldiers, literally “selection,” best known during the traditional Republic. It depended on the census, carried out by the censors every five years. Male Roman citizens between age 17 and age 46 were liable to be called up. (Those between 17 and 60 were called up in a *levée en masse*, the *tumultus*, an emergency decree.) The consuls or other commanding magistrates decided how many men were needed for the year’s campaign, and the Senate passed a decree authorizing the levy. On a certain day, when a red flag was flown from the Capitoline, male citizens on the list were required to present themselves on the Campus Martius. The magistrates then selected the men most suitable for military service, as described by Polyb. 6.19.6–20.4. Not all citizens summoned would be selected for service; the magistrates probably selected younger men and those who were more strong and fit.

To evade the *dilectus* was traditionally a crime, but some Roman campaigns were less popular than others; the Spanish Wars of the 150s BCE were very unpopular (fighting the fierce and poor Spanish tribes offered much hardship and little plunder) and many men attempted to evade the levy. Citizens who wished not to serve could appeal to the tribunes of the plebs, who were formally empowered to provide *auxilium* (aid) to citizens who were oppressed by the magistrates. The consuls were able to resist the tribunes’ interference by declaring a *tumultus* (state of emergency) in which all citizens were required to serve.

Those selected by the *dilectus* subsequently presented themselves at specified locations to take the military oath (*sacramentum*) and be formally enlisted as soldiers. Those who had already served many campaigns might not be required to serve further. Sixteen to 20 campaigns were the upper limit for infantry in the traditional Republic, 10 campaigns for cavalry. Cavalrymen (*equites*, not to be confused with the social class termed equestrians) were aristocrats and members of the political class; they were expected to serve from age 17 to 26 or so, then run for office, seeking

election to magistracies that might feature military command. Roman nobles also served as military tribunes (not to be confused with tribunes of the plebs).

The *dilectus* of the late Republic and empire were probably conducted less formally, occurring away from Rome, in Italy and the provinces. Taking the military oath and enlistment on the rolls of a military unit (*in numeros referri*) were still solemn events, but recruitment now investigated the general status of a would-be soldier, determining that he was a Roman citizen (for legionary service) and that he was not a slave, criminal, or deserter.

Diocletian (Emperor) (284–305 CE)

Emperor 284–305, Diocletian (Gaius Aurelius Valerius Diocletianus) was a creator of the later Roman Empire, as was his eventual successor Constantine I (306–337). Though he became notorious for initiating the last persecution of the Christians (303–311), Diocletian's major accomplishments included the reorganization of the Roman administration and tax system. His most remarkable creation was his political system, the Tetrarchy, which took adoptive succession to an extreme and collapsed in its second phase, after his abdication in 305. He and his colleague Maximian were also remarkable as the only emperors to abdicate; Maximian attempted to regain the purple.

Little is known about Diocletian's youth. He was named Diocles and is

said to have been the son of a freedman of the senator Anullinus; in another version, his father was a *scriba*, a copyist. Diocles was born in the early 240s; since he retired near Salonae in Dalmatia, he may have lived there in his youth. He became a military officer during the third-century crisis and reconquest. According to the unreliable *Historia Augusta*, he was promoted by Probus (278–282) as one of the *protectores*, the staff college of talented officers.

The accession of Diocletian was in effect a usurpation, colored by legend. Diocles was Emperor Numerian's commander of the guard (*comes domesticorum*, though this may be a later title). The Roman army and emperor were returning westward from Carus' Persian campaign. Numerian was a young man, under the thumb of his praetorian prefect, Aper. Aper allegedly murdered Numerian, concealing his death from the troops, but the emperor's corpse began to rot, exposing the crime. Aper intended to become emperor, but Diocles was acclaimed instead. Diocles immediately had Aper arrested, brought him before a tribunal of officers, and stabbed Aper to death, saying, "This is Numerian's murderer." Some modern scholars suspect that Diocles conspired with Aper to murder Numerian, then betrayed Aper to hide his guilt. The contemporary sources, even the very hostile Lactantius, do not suggest this version. Diocles changed his name to one more suitable for a Roman emperor: Diocletian.

Diocletian's first challenge was Carinus, Numerian's older brother and a more talented general. Diocletian and Carinus fought a battle near Margus in July 285; Carinus actually won the battle, but was assassinated by a follower, allowing Diocletian to claim the victory; Carinus' officers went over to him.

The empire was hardly stable. The Bagaudae, led by Aelianus and Amandus, were ravaging Gaul; depicted as a bandit leader, Amandus may have called himself emperor, minting coins. Rather than act alone, Diocletian elevated to the rank of Caesar an old comrade of his, Maximian, in 285. He in fact adopted Maximian as a son, though Maximian (born ca. 250) was close to his age, a pattern resembling the adoptions of Trajan, Hadrian, and the Antonines. Maximian successfully eliminated the Bagaudae, but then the captain of the Channel fleet, Carausius, revolted in 286, holding Britain and the Gallic coast. The revolt of Carausius probably induced Diocletian to elevate Maximian to co-Augustus (286). Past emperors had made their sons co-Augusti—such as Septimius Severus and Caracalla

or Valerian and Gallienus. Diocletian's distinctive partnership with the nonrelated Maximian resembled Marcus Aurelius and Lucius Verus, or more recently Pupienus (Maximus) and Balbinus, shortlived senatorial emperors (238). However, Marcus and Lucius were already related by adoption.

Aureus of Diocletian (284–305 CE). The emperor Diocletian, a military officer of obscure origins, formed an imperial junta or Tetrarchy of co-emperors. Though Diocletian was a highly capable ruler, reorganizing the later Roman administration and taxation system, his political system broke down after 305. Located in the Yale University Art Gallery, New Haven, Connecticut. (Yale University Art Gallery)

Not yet ready to attack Carausius, Maximian campaigned in the west against Germanic peoples. Diocletian campaigned in the eastern empire, where he established Tiridates III as king of Armenia in 287 and reorganized the eastern frontier. After Shapur died in 270, the Persian Sassanid dynasty had become less aggressive toward Rome, having its own succession crisis; three descendants of Shapur ruled briefly until Narses, a son of Shapur,

seized the throne in 293.

Maximian failed to expel Carausius from Gaul and Britain, and in 293 Diocletian took an unprecedented step, elevating two deputy emperors, the Caesars, Galerius, and Constantius I. In previous reigns, Caesars had been relatively young men or boys, typically sons of the emperor, not entrusted with great power. Galerius and Constantius were grown men (about the same age as Diocletian himself), proven military officers and administrators. The four emperors were called the Tetrarchs ("Four Rulers" in Greek). Symbolism bound them; Diocletian took the title Jovius, Maximian Herculus, forming quasi-divine dynasties. The daughters of the Augusti also married the Caesars. Diocletian's daughter Valeria (his only child) married Galerius. Constantius was assigned to the western empire, as a deputy of Maximian, and Galerius to the eastern empire, as a deputy of Diocletian; however, the Augusti and the Caesars lacked strict geographical jurisdictions as they constantly traveled. The peripatetic presence of the four emperors in the provinces, especially along the frontiers, was intended to discourage revolt and usurpation.

In Britain, Carausius was murdered by his finance minister Allectus, who claimed the purple. In 296, Constantius launched a successful campaign against Allectus, destroyed him, and was hailed as restorer of Britain.

Meanwhile Narses, the Sassanid king, ejected Tiridates III from Armenia and went to war against Rome (296). Diocletian sent Galerius to fight Narses. Galerius lost his first battle against Narses, displeasing Diocletian, who let him try again. Galerius invaded through Armenia, swept down the Tigris, and captured Ctesiphon, the Persian capital, returning up the Euphrates (297). Consolidated by a peace treaty at Nisibis that was favorable to the Romans, Galerius' victory restored Roman control in the east as far as Mesopotamia and avenged the defeat and capture of the emperor Valerian in 260.

It had been routine for emperors to use subordinates as commanders during the earlier Principate, a pattern Diocletian somewhat returned to. He chose Maximian, Constantius, and Galerius to be his generals. However, Diocletian did command more routine fighting on the Danube, and when Egypt revolted under Domitius Domitianus and Achilleus in 297, Diocletian commanded the siege of Alexandria and restored order to the province (298). He extensively strengthened and rebuilt frontier installations, most notably a road system in southern Syria, the *strata Diocletiana*.

Diocletian's major talents were as an administrator. He reorganized the provinces, dividing them into smaller provinces (a trend that had begun earlier) to make them easier to administer and shorten lines of communication and travel, and also to discourage would-be usurpers. The provinces were grouped into dioceses, each administered by a *vicarius*, who answered to the praetorian prefects, one prefect per emperor. Civil administration and military command were separated; military commanders, or *duces* (sg. *dux*) commanded armies that stretched across several provinces, but they had no access to the treasury, again to discourage revolt.

Diocletian followed the policy begun by Gallienus of excluding senators from provincial governorships and military commands, though Diocletian allowed senators to hold administrative posts in Italy and the traditional proconsulships of Africa and Asia.

Diocletian also reorganized the financial system of the empire. He reinstated a census, which had been allowed to lapse, but changed the mode of assessment of land and poll tax. His enemies claimed that he greatly increased taxes to support a vastly increased bureaucracy and army, but documentary sources show that the actual burden of taxation did not greatly increase; no doubt taxes had been unsystematic during the third-century crisis, with the army requisitioning what it needed in the frontier regions. Much taxation was still collected in kind. The debasement of the coinage continued, and Diocletian attempted to retariff the coinage, minting more bronze coins. Inflation motivated his Edict on Maximum Prices (301), which was inscribed on stone at various sites and assigned fixed prices to an exhaustive list of commodities and services. The Edict blamed the greed of merchants, threatened them with capital punishment, and was intended to benefit the army. It was a failure; some merchants died, and prices continued to increase.

Diocletian's other least successful policy was his persecution of the Christians, begun in 303 and preceded by a purge of Christians from the army. Diocletian was a devout religious traditionalist, upholding Jupiter and other state gods of traditional Rome. He issued an edict against the Manichaeans, a quasi-Persian religious sect. Yet Diocletian did not persecute the Christians till late in his reign, and tolerated their presence at Nicomedia (though Constantine, being educated at Diocletian's court, was not yet a convert). According to Lactantius, Diocletian was influenced by

Galerius, who hated Christians and who had become arrogant after his great victory over Persia. Diocletian was also superstitious, believing that a sacrifice he officiated at (a traditional role of the emperor) had been disrupted by Christians.

The so-called Great Persecution of 303–311 began with an edict requiring Christians to hand over their sacred books; destruction of churches and meeting places; elite Christians lost the legal privileges of their status; imperial freedmen were returned to slavery; and Christians lost legal rights to sue or counter-sue. Later edicts (2) imprisoned Christian clerics; (3) released clerics who sacrificed to the gods or emperors; and (4) required all Christians to sacrifice to the gods or emperors. Those Christians who defied the edicts were liable to torture and execution. The persecution was enforced very unevenly. In the eastern empire it was enforced by Diocletian, Galerius, and later Maximinus II. In the western empire, Maximian enforced the edicts vigorously, but Constantius I did not (according to later sources favorable to his son Constantine). It was also up to local officials to enforce the edicts, and many looked the other way.

In winter 303 Diocletian traveled to Rome to attend his *vicennalia* or 20-year jubilee with Maximian. There he compelled Maximian to promise to abdicate with him. On his way through the Balkans to Nicomedia Diocletian fell ill and was seriously ill all winter. He abdicated on May 1, 305 at Nicomedia, as did Maximian at Milan. At his abdication, Diocletian elevated Galerius to Augustus; Galerius' nephew Maximinus II Daia became Caesar. In Milan, Constantius I became Augustus; Severus, a friend of Galerius, became Caesar. These arrangements surprised courtiers, who allegedly had expected Constantius' son Constantine and Maximian's son Maxentius to become the Caesars. According to Lactantius, Galerius bullied Diocletian (no longer strong enough to rule) into abdication and forced his own choice of Caesars on him. Some modern scholars have seen the choice to abdicate and choice of Caesars as Diocletian's own, affirming the principle of adoptive succession over hereditary succession. However, the choice of Galerius' nephew Maximinus does not fit, appearing dynastic.

Diocletian retired to a palace at Spalato (the modern city of Split) in Dalmatia that he had begun building earlier (supporting the theory of a planned abdication). He abstained from the new period of conflict, termed in CAGR the "Tetrarchic Civil War," that began when Constantius died and Constantine revolted at York in 306. Diocletian himself died of natural

causes in 311 or 313.

The sources for Diocletian's reign are challenging, contemporary narrative being provided by the Christian authors Lactantius (*On the Deaths of the Persecutors*) and Eusebius (*History of the Church*). In particular, Lactantius condemns Diocletian's policies and glorifies Constantine. The parts of Ammianus Marcellinus and Zosimus that covered Diocletian's reign are not extant. Writing in the 350s, Eutropius and Aurelius Victor provide a more favorable pagan view of the reign. The *Historia Augusta's* *Life of Carus, Carinus and Numerian* provides a glimpse of Diocletian but invents material (the author did not know he was called Diocles before his accession). Diocletian's policies are best studied through the documentary sources, which increase in volume as stable conditions returned to the empire. Modern scholarship on Diocletian has only recently escaped the tendency to project upon him the entire history of the later Roman Empire and its fall.

Diodorus Siculus (d. 30 BCE)

A Greek author of the *Bibliothēke* or “Library,” a history of the world from mythological times to 60 BCE. Its focus was Greek and Sicilian history. Books 1–5 and 11–20 survive intact, but the others survive only as fragments. Diodorus Siculus relied on earlier Hellenistic historians, Ephorus and Hieronymus of Cardia, for Hellenistic Greek history and relied on Polybius for Roman affairs. Diodorus is the best authority for Sicilian affairs, including the Sicilian Slave Wars. In general, Diodorus is a second-rate historian, derivative from other Greek authors, though his reputation has received reevaluation in recent scholarship.

Dionysius of Halicarnassus (ca. 60–7 BCE)

The Greek historian and rhetorician Dionysius of Halicarnassus wrote a history of early Rome. He spent the second half of his life in Rome, following the Roman civil wars, Dionysius reworked earlier texts in imitation of Herodotus, Thucydides, as well as Plato’s writing style, a method now called Dionysian *imitatio*.

As an orator Dionysius analyzed the rhythm, sounds, and arrangement of words with euphonic preferences. His works include: *The Art of Rhetoric*, *The Arrangement of Words*, *On Imitation*, *Commentary on the Attic Orators*, *On the Admirable Style of Demosthenes*, *On the Character of Thucydides*, and *Roman Antiquities*. In *On the Character of Thucydides* Dionysius rewrote Thucydides’ *Peloponnesian Wars* in a Herodotean style.

Dionysius’ history occasionally conflicts with his contemporary historians suggesting that he either confused myth with history, used different sources, or wrote with an alternate motivation. Writing in the reign of Augustus just after the civil wars possibly influenced Dionysius’ retelling of Roman history, through the lens of imperial triumphalism. This

theory also insinuates that the Roman civil wars influenced Greek writing as a whole. Dionysius' *Antiquities*, along with Livy's history, provide the primary accounts of early Roman history.

Diplomacy

The earliest evidence for Roman diplomatic relations is a treaty between Rome and Carthage, dating to 509 BCE, recorded by Polybius (3.22). In addition to treaty-making, Roman diplomacy consisted primarily of sending ambassadors to other states to establish informal (nontreatied) friendly relations, investigate matters deemed to affect Roman security interests, settle disputes, demand satisfaction for (perceived) injuries, and to declare war. The Romans also participated in interstate mediations as both a broker and a belligerent. Roman diplomacy also encompassed establishing terms of surrender, drawing up treaties of peace, and dispatching commissioners (usually in groups of ten) to oversee the implementation of the terms of peace following war.

Compared to modern diplomacy, Roman diplomacy lacked sophistication. This was due, in part, to the nature of long-distance communications and travel in the ancient world; the escalation of international incidents often outpaced Rome's ability to defuse them by dispatching ambassadors and messages abroad. But Rome also lacked a standing diplomatic corps. They had no specially trained international

relations experts, and no missions or embassies abroad. They did not even field the equivalent of Greek *proxenoi*, “public guests” resident in foreign states, whose purpose was to represent and look out for the interests of their states of origin.

Because most ancient states, including Rome, participated in what anthropologists describe as “shame” and “honor” cultures, where public insults to an individual’s or a state’s honor demanded at least equivalent (and often disproportionately higher) shaming responses, attempts to avert conflict through diplomacy lacked finesse and were rarely successful. Typically, Roman demands for satisfaction (*rerum repetitiones*) were couched in terms that the other side could not help but consider nonnegotiable infringements on its national sovereignty or honor, and were therefore bound (and perhaps designed) to fail. Modern political scientists call this “compellence diplomacy.” Part of the reason that such an aggressive diplomatic stance was considered practical in the ancient, prenuclear age was that warfare, the most common result of such negotiations, was considered a reasonable price to pay, in terms of blood and treasure, to redress slights to national honor. The meticulous diplomacy of the Cold War era stands in stark contrast since the price of failure (nuclear war) was so much higher. “Compellence diplomacy” still occurs, however. So, on September 20, 2001, US President George W. Bush issued explicitly nonnegotiable demands that if it wished to avoid war with the United States, the Taliban government of Afghanistan must turn over all al-Qaeda leaders on Afghan soil, including Osama bin Laden, and give US military forces open access to terrorist training camps there. Rome delivered a similarly nonnegotiable demand to Carthage in 218 BCE after Hannibal attacked Rome’s Spanish ally Saguntum: to avoid war with the Romans, the Senate declared, Carthage must surrender Hannibal to answer for his breach of treaty (Livy 21.6.8; cf. 21.10–11.2, 18). In both cases, the result was the same: a long, bloody, and expensive war.

Contrary to popular perception, the Romans were more willing than their system competitors to allow time and opportunity for negotiated settlements. Although individual Roman diplomats could, and frequently did, come across as officious, rude, arrogant, and tactless—in a word, undiplomatic—the Romans generally, and in contrast to their system competitors, employed significant self-imposed religiously-based restraints on their own belligerent behavior. So, for example, the apparently very

ancient native Italic fetial procedure, which allowed a rival state 30 (or 33) days to give satisfaction for (perceived) injury or slights to Rome's honor was used by the Romans well into the historical period. This same impulse is evident in Rome's repeated attempts to negotiate solutions before the outbreak of major wars. For example, during the run-up to the First Punic War, Appius Claudius Caudex (consul 264 BCE) probably attempted to negotiate a solution with Carthage three times—the second time after Carthaginian ships had already attacked Roman ships in the straits of Messina.

Disbandment

The disbandment of a Roman military unit was the most severe punishment that the Roman army inflicted on a unit for military defeat or disloyalty. It was more severe than decimation, which impacted only a few members of the unit and after which the unit continued to exist.

In disbandment, the unit might be totally eliminated and never reconstituted, or the individual personnel might be dishonorably discharged without doing away with the unit which was freshly recruited.

Disbandment might be punishment for a military catastrophe, such as the Varian disaster (9 CE), in which a German ambush destroyed three legions, Legio XVII, Legio XVIII, and Legio XIX, which were never reconstituted under these names.

Disbandment might also be punishment for disloyalty, as when Septimius Severus disbanded the Praetorian Guard for its revolt against and assassination of Pertinax (193 CE) and for its support of the “auction” of the empire between Didius Julianus and Sulpicianus (193 CE). Septimius Severus forbade the future recruitment of the Guard from Italians and instead recruited a new Praetorian Guard from legionaries, mostly, according to Cassius Dio, from Pannonia and the other Danubian provinces.

Other legions were totally disbanded as a punishment for defeat or disloyalty. Following the Gallic revolt in 70 CE, Vespasian disbanded Legio I, Legio IV Macedonica, Legio XV Primigenia, and Legio XVI Gallica, which had surrendered to the Gallic rebels. Elagabalus (218–222 CE) disbanded Legio III Gallica for disloyalty; however, his successor Alexander Severus (222–235) reconstituted it. Gordian III (238–244 CE) disbanded Legio III Augusta for disloyalty; it was reconstituted by Valerian.

It is possible that the surviving soldiers of a disbanded unit were redistributed to other units, but they were probably stigmatized by the punishment and unwelcome. Dio implies that the Italian praetorians dismissed by Severus were not enrolled elsewhere; he claims that after Septimius Severus discharged them, the young men of Italy who would have joined the praetorians turned to brigandage for lack of occupation.

A number of legions disappeared for unknown reasons: the Legio V Alaudae (ca. 85–86 CE), Legio IX Hispana (ca. 108), Legio XXI Rapax (ca. 92), and Legio XXIII Deiotariana.

Dishonorable Discharge

Dishonorable discharge (*ignominiosa missio*) was the most severe punishment, short of death, that the Roman army of the Republic and Principate inflicted on individual personnel. A dishonorably discharged soldier lost the right to his pension, if he was a praetorian or legionary, and to the Roman citizenship and marriage to a noncitizen, if he was an auxiliary or fleet soldier. He did not receive the privileges of a veteran, which included tax immunities and immunity from corporal punishment. A dishonorably discharged soldier may even have received the legal stigma known as *infamia*, which excluded him from certain forms of legal process and assimilated him to the other *infames*, or infamous persons, including convicts, prostitutes, pimps, actors, and gladiators.

Dishonorably discharged soldiers sometimes attempted to enlist in other units of the Roman army, according to the Roman jurists writing on military affairs. The jurists state that convicts and dishonorably discharged soldiers should not be permitted to enter the army. In a society lacking reliable proofs of identity, such soldiers could not be easily identified before the authorities started tattooing recruits in the later Empire.

No particular ritual is known for the dishonorable discharge of Roman soldiers, in comparison with the “drumming-out ceremony” of eighteenth- and nineteenth-century Western armies in which the victim was stripped of his uniform facings and insignia and expelled from the unit. Similar anecdotes from Roman histories describe the ritual disgrace of cowardly or incompetent Roman officers, usually in the middle and late Republic, who were forced to stand in public without their clothes or holding a pole or block of turf, alluding to fatigues which personnel of their rank normally would not perform. These shaming punishments were temporary, probably intended to substitute for corporal punishment, which was not appropriate for officers. Shaming punishments were imitated by the emperor Augustus and by Gnaeus Domitius Corbulo, a general in the reigns of Claudius (41–54) and Nero (54–68).

Divisions of the Army (Imperial)

The Imperial Roman army was divided into different branches of the service: legions, *auxilia*, Praetorian Guard, urban cohorts, fleets, and the *vigiles* or fire watch of Rome. To these were added the *numeri* (ethnic irregulars) and the *equites singulares Augusti* (the emperor's horse guards). Such a division into multiple branches, familiar in modern armies (e.g., US Army, Navy, Marines, Air Force, Special Forces, and Coast Guard), is a development of the imperial period. In the Republic, the legions were only distinct from the allies (*socii*) and from non-Italian troops recruited as auxiliaries. Though the Romans of the Republic developed a navy during the First Punic War, they later recruited allied naval forces, predominantly Greek. In addition to stabilizing the number of legions, Augustus is thought to have regularized the *auxilia* and created the Praetorian Guard, urban cohorts, fleets, and *vigiles*.

Augustus reduced the number of legions, which had grown to 60 during the triumviral wars, to 28. Three of these legions, Legions XVII, XVIII, and XIX, were destroyed in the Varian disaster (9 CE) and were not reconstituted, reducing the number to 25 at Augustus' death. Tacitus (*Annals* 4.5) describes the geographical disposition of the legions in 23 CE. Two new legions were created in 39 CE, one in 67, and two in the civil war of 68–69 CE. Marcus Aurelius created two new legions for the Marcomannic War, and Septimius Severus created three legions. Two legions had been lost, Legio IX Hispana at uncertain date, and another in Domitian's Dacian War, so that

the total at the end of Severus' reign (211) was 33. The disposition of the legions in the reign of Antoninus Pius (138–161) is attested in an inscription, *CIL* VI 3492 = *ILS* 2288, and the disposition of the legions can also be studied from literary and documentary sources, including inscriptions, papyri, and brick stamps (bricks produced by or for the army). Detachments of legionaries (*vexillationes*) might be deployed to other locations as needed. In the first two centuries CE, legions were commanded by legionary legates, men of senatorial rank.

Augustus is thought to have regularized the *auxilia*. Non-Italian troops had been recruited previously; for instance, Julius Caesar recruited Gallic cavalry to supplement his legions. Auxiliary units were much smaller than legions, numbering approximately 500 or 1,000 men each. *Alae* were units of cavalry; *cohortes* were infantry, and there were also *cohortes equitatae*, or mounted infantry. The auxiliaries in total numbered perhaps 180,000 in the late first century CE, and 220,000 in the mid-second century. Auxiliary units were often recruited from ethnicities with a strong fighting tradition, and were named for a particular ethnic group, though recruitment from that ethnicity might not continue but became localized where the unit was stationed. Members of the *auxilia* served 25 years, and as noncitizens were granted the citizenship and right to marry upon discharge. However, by the second century CE many auxiliaries were already Roman citizens at enlistment. Auxiliary units were commanded by equestrian prefects.

Augustus also created or regularized the Praetorian Guard. It may have developed from the *cohors praetoria*, the republican commander's personal guard. In 27 BCE, Augustus created the nine cohorts of praetorians (approximately 1,000 men per cohort), recruited from Roman Italy. Domitian increased the number of cohorts to 10. Three cohorts of praetorians were always stationed in Rome, intended to keep public order; the other cohorts might accompany the emperor on campaign. The Guard became notorious for its role in politics, supporting coups, and assassinating emperors. In 193, Septimius Severus disbanded the Italian praetorians to punish them for assassinating Pertinax, and recruited new praetorians from the Balkan legions. In 312, the Praetorian Guard was finally disbanded permanently by Constantine I (306–337) to punish them for supporting his rival Maxentius. However, similar guard corps developed in the Later Roman army, termed *scholae palatinae*. Notably, the praetorians were commanded by the praetorian prefect, created in the reign of Tiberius. The

praetorian prefect's duties expanded vastly beyond the command of the Guard to become the emperor's effective deputy in civil administration. Praetorian prefects also persisted beyond the dissolution of the Guard, as high-ranking officials in the later Empire. Also notably, service in the praetorians, which was shorter (16 years) and better paid than legionary service, was often a stepping stone to promotion for individual guardsmen. Ex-praetorians might become legionary centurions or enter the civil administration.

In Rome were stationed the *cohortes urbanae* (urban cohorts), also created by Augustus. These troops were lower ranking than the praetorians but played a similar role in maintaining public order and displaying a military presence in the city. They numbered three (later four) cohorts, originally 500 men each, later increased to 1,000. As with the praetorians, they were recruited from Italians. They were commanded by the urban prefect of Rome. The urban prefect also became an important official who probably delegated the details of administering the urban cohorts; after emperors no longer resided at Rome, the City was governed by the urban prefects.

The fleets were created probably in the early empire, beginning with the "praetorian" fleets based at Misenum and Ravenna. Other fleets patrolled the Rhine and Danube rivers, the Black Sea, and the English Channel. A fleet was based at Forum Julii in Gallia Narbonensis and another was based at Alexandria. The fleet soldiers were regarded as a lowly branch of the service, serving 26 to 28 years and recruited from noncitizens. As with the *auxilia*, they received citizenship at discharge. They combated piracy; fleet soldiers included marines trained to fight. But the fleets' essential duties were logistic, providing heavy transport for troops and supplies in a period when, despite Roman roads, land transport was slow and expensive.

The *vigiles*, Rome's fire brigade, were created by Augustus and also ranked low, originally being recruited from freedmen. Eventually seven cohorts of 1,000 men each were assigned to the wards of Rome with the task of preventing the spread of fires by destroying threatened property. They were probably not trained as combat soldiers.

Later in the first century CE, the *equites singulares Augusti*, or emperor's Horse Guards, were created, numbering 1,000. Recruited from the Batavians, they replaced the *Germani corporis custodes* or the emperor's German bodyguards, a Julio-Claudian institution. The *equites singulares*

accompanied the emperor on campaign and provided cavalry support for the Praetorian Guard. They might be promoted from the legions. Also later in the first century was the appearance of the *numeri* or ethnic irregulars, small fighting units recruited from ethnicities with particular tactical specialties, such as slingers (users of slingshots as weapons) or Syrian archers.

The emperor Gallienus' reorganization of the Roman army in the mid-third century CE produced a central cavalry force, later termed *comitatenses* or field army, which could move more rapidly than the infantry legions and was a larger, more formidable force than individual *auxilia* cavalry units. The other branches of the service continued to exist, but Constantine disbanded the Praetorian Guard in 312. The *equites singulares* also disappeared. Diocletian (284–305) enlarged the army somewhat, but shrank the size of individual legions. In the Later Empire also appeared the *limitanei* or frontier forces, lower in status than the *comitatenses* and whose role is debated by scholars.

The organization of the command structure changed more greatly, *duces* (sg. *dux*, “commander”) commanding forces across several provinces, but not having any civil jurisdiction. *Comites* (“counts”) were also regional commanders. The *magistri militum* or “marshals” (sg. *magister militum*) were superior in rank to *duces* and *comites*, topped by the *magister utriusque militiae* or “Marshal of Both Services,” infantry and cavalry, who was effectively commander-in-chief. This full structure is visible in the early fifth century in a document termed the *Notitia Dignitatum*.

Documentary Sources

The main sources for the narrative history of Roman warfare are Greek and Latin historians, biographers, and other literary authors. However, the Roman army and military affairs are also extensively attested in Latin and Greek documentary sources: stone inscriptions, papyri, ostraca and tablets, metal military diplomas, and coins. These documentary sources reveal the day-to-day activities of the Roman army and the details of Roman military careers and military organizational structure. They illustrate the economics and logistics of the Roman army and attest the penetration of elite military values and of Latin and Greek literacy in the lower ranks of the Roman army. In documentary sources, much of the daily activities of the Roman army in the eastern empire were conducted in Greek, though more official and permanent documents were in Latin, the “language of power.”

Monumental inscriptions carved on stone were a relatively formal documentary source, representing what the inhabitants of the classical world wished to preserve for posterity. Typical inscriptions in the vicinity of a legionary base include lists of honorably discharged personnel; religious dedications by personnel to local gods; commemoration of victories; treaties with individual communities; and career epitaphs, listing the ranks and offices held by Roman officers and soldiers.

Career epitaphs range from the careers of senators (holding both military ranks and civilian offices) to the careers of simple soldiers, recording their rank and unit, and how many years they served. Such inscriptions attest a large variety of Roman military occupational specialties, displaying the Roman army’s range of logistic and support activities as well as its tactical functions. Modern scholars have reconstructed the promotion patterns of low-ranking officers within the imperial legion from such career epitaphs and other military inscriptions.

The Roman army also generated more ephemeral documents as part of its daily activities. These documents might be inscribed on wax-covered wooden tablets, written with ink directly on thin wooden tablets, or written with ink on papyrus, a paper-like writing material manufactured from papyrus reeds. Another type of writing material, more casual, was ostraka, or potsherds that were large and flat enough to write on with ink. Such documents survive mainly from the arid areas of the Roman Empire, where fragile writing materials are preserved in dry conditions, but wooden tablets

have also been preserved by burial in bog-like conditions, for example at Vindolanda, a fort near Hadrian's Wall in north England. Surviving documents illustrate not just Roman military bureaucracy, including personnel management and logistics, but also the private affairs of individual soldiers, including their personal letters and legal instruments such as birth certificates and wills.

Documentary sources may also be inscribed on metal, such as the military diplomas (diplomata) given to the praetorian, auxiliary, and fleet veterans at their honorable discharge. These were bronze tablets inscribed in Latin; they are collected and published in a similar manner to stone inscriptions.

Coins may also be considered a documentary source, containing (in the Principate and later Empire) the titles of emperors, which indicate the year of their reigns and various honorary titles, and propagandistic legends, words or phrases (usually highly abbreviated). Coins are also, of course, an iconographic source, depicting images, in particular thematic images related to their legends.

In the traditional Roman Republic, Roman citizens within the boundaries of the city of Rome (and up to a mile outside it) were “at home” (*domi*), a condition affecting their civil rights. To be *domi* was to be a civilian, a status that extended beyond the city of Rome to Roman territory, but the most “civilian” location was within the *pomerium*, the ritual boundary of the city of Rome. Armies could not cross the *pomerium*, citizens could not bear weapons within it, and the temples of war gods such as Mars and Bellona stood outside the *pomerium*. Only a triumphant general was allowed to enter the *pomerium* with his army for the triumph ceremony.

Roman citizen civilians were protected by the right of *provocatio* from Roman magistrates’ abuses of power. The *leges Valeriae de provocatione* of 509, 449, and 300 BCE and the *leges Porciae de provocatione* of uncertain date (early second century BCE) forbade magistrates to execute citizens at Rome without trial; citizens had the right to appeal (*provocare*) to the people.

In contrast, in military service (*militiae*) Roman citizen soldiers lacked the right of *provocatio* (Cicero, *Laws* 3.6). They were subject to the magistrates’ unrestricted *imperium militiae*, including whatever summary justice the commanders chose to inflict as military discipline. In theory, the consuls or dictators had the right to put anyone to death for disobeying an order in the field, a breach of military discipline that was very serious. Other commanders put soldiers to death for even lesser infractions, such as not wearing arms in the field or leaving the standards (Tacitus, *Annals* 11.18, 13.35), incidents at a relatively late period that illustrate the persistence of this tradition.

The contrast of rights *domi* vs. *militiae* was blurred in the late Republic by civil war and violent civil conflict within the city of Rome and by the creation of the *senatus consultum ultimum* (Last Decree of the Senate, creating a state of emergency and in effect suspending civil rights). Many members of the Roman elite were shocked by the violence that ensued, especially during the proscriptions (purges of political enemies) inflicted by Sulla and by the triumvirs Antony, Octavian, and Lepidus.

In the imperial period, civil rights were blurred further because many inhabitants of the Empire were not Roman citizens and were subject to summary judgment (*cognitio extra ordinem*) at the provincial governor’s discretion. However, Roman citizens could claim their right to trial at Rome. Appeal to the emperor as protector of his subjects and redressor of injustice replaced appeal to the people.

Domitian (Emperor) (81–96 CE)

Titus Flavius Domitianus, the Flavian emperor Domitian, was born in 51 CE and reigned from 81 to 96, when he was assassinated by a palace conspiracy. He appears to have been a competent general, a conscientious administrator, and an upholder of Roman religious tradition, but his more autocratic conception of the imperial role and his persecution of suspected conspirators alienated the Senate, making him one of the most hated Roman emperors in the literary tradition.

Domitian was the last of the Flavian dynasty, succeeding his father Vespasian (69–79) and older brother Titus (79–81). Vespasian and Titus held military commands at the time of the Jewish War (66–70), Titus taking command of the Jewish War when Vespasian prosecuted the civil war with Vitellius. At that time (69) Domitian was still a boy and did not yet hold office or command. He resided in Rome with his uncle Flavius Sabinus, the city prefect; after the Flavian army (led by Antonius Primus) liberated Rome from the Vitellians, the Flavian soldiers hailed Domitian as Caesar. In Vespasian's and Titus' reigns Domitian was clearly designated as a successor to Titus, holding the consulship repeatedly (consul *ordinarius* in 73 and 80, suffect five other times). Domitian thus succeeded Titus without challenge.

As emperor Domitian took a more active role in military command,

campaigning in person against the Germans and Dacians. He waged a successful campaign against the Germanic Chatti in 82-83, holding a triumph and adopting the title Germanicus. In 85, the Dacians invaded the Roman province of Moesia, overrunning it and killing the Roman governor. Domitian campaigned in person against the Dacians; despite the death of another Roman commander in 86, Domitian won a victory against the Dacians in 88. He did not follow up this victory but made peace with the Dacian king Decebalus in 89. His forces were needed elsewhere, against the Marcomanni and Quadi (Germanic peoples across the Danube). In 92, Domitian then began war against the Sarmatians (a people from Central Asia) and Germanic Suebi, who had made an alliance against Rome.

Domitian's military activities are attested by the court poetry of Statius and Martial, but belittled by the senatorial tradition represented by Tacitus and Suetonius. In his biography *Agricola*, Tacitus focuses on Domitian's recall of Gnaeus Julius Agricola from Scotland, representing a probably rational policy (Domitian needed reinforcements for his other wars) as motivated by Domitian's cowardice and jealousy. Pliny the Younger also depicts the military careers of young senators as compromised by Domitian's jealousy (*Letters* 8.14). Suetonius, in his *Life of Domitian*, depicts Domitian as fond of hunting but physically lazy, and minimizes his military achievements.

Domitian was a religious traditionalist and adopted the role of *corrector morum*, "reformer of morals," and *censor perpetuus*, "perpetual censor." In these roles he put to death several Vestal Virgins (priestesses of the goddess Vesta) for unchastity. He also appears to have been a conscientious administrator. Despite the senatorial disparagement of his reign and condemnation of his memory, his administrative policies were permitted to stand.

Domitian's greatest failure was his relationship with the Senate. The Augustan concept of the Principate, largely followed by his successors (Gaius and Nero excepted), emphasized the emperor's role as *civilis princeps*, a "first among equals" with respect to the Senate. In this role, the emperor did not exalt himself in the manner of a monarch but remained modest and accessible. Domitian allegedly adopted a more autocratic role, imposing greater formality at court, wearing triumphal dress in the Senate House, and being addressed as "dominus et deus" (Lord and God). Domitian's behavior alienated the senators, some of whom conspired

against him. Antonius Saturninus, the governor of Upper Germany, revolted against Domitian in 89 and was quickly defeated. Domitian, now paranoid about conspiracies, persecuted suspected conspirators.

In 95, Domitian put to death his kinsman Flavius Clemens (the father of two sons whom Domitian had adopted). This was the last straw, and various senators joined a palace plot against Domitian. Domitian was assassinated by members of his household on September 18, 96. The Senate endorsed the elderly Marcus Cocceius Nerva as Domitian's successor, and pronounced *damnatio memoriae* upon Domitian, destroying portraits of Domitian and effacing his name from inscriptions.

Domitian's much more popular successor, Trajan (98–117, following Nerva who only reigned two years) reaped the credit for policies and careers begun under Domitian. The Dacian Wars, begun by Domitian but put on hold to fight the Sarmatians and Suebi, were resumed and won by Trajan. Many famous senatorial authors, such as the historian Tacitus, the administrator and technical author Sextus Julius Frontinus, and the administrator and man of letters Pliny the Younger, began their careers under Domitian, and thus must have been in good standing with Domitian. The future emperor Hadrian (117–138) also began his career in the reign of Domitian.

Donations of Alexandria

The Donations of Alexandria, in which Mark Antony bestowed regions of the Greek east on Cleopatra and their children, featured in Antony's policy as warlord in the eastern Mediterranean and, more obviously, in Octavian's

propaganda against Antony.

Antony had three children by Cleopatra, the twins Alexander Helios and Cleopatra Selene (born in 40) and Ptolemy Philadelphus (born in 36). In 34, Antony proclaimed Alexander Helios the king of Armenia, Media, and Persia; Cleopatra Selene queen of Cyrenaica and Libya; Ptolemy Philadelphus king of Syria and Cilicia. Cleopatra was proclaimed Queen of Kings and Queen of Egypt. Her son by Caesar, Caesarion, was proclaimed King of Kings and King of Egypt. At the ceremony of the Donations, held at Alexandria, Antony and Cleopatra were costumed as the gods Dionysus-Osiris and Aphrodite-Isis; Caesarion was named son of the deified Julius (Caesar).

Octavian exploited the announcement of these honors at Rome to consolidate popular feeling against Antony as having become un-Roman, Hellenistic, and “Oriental,” drawing on long-standing Roman ethnic stereotypes and dislike of monarchy.

Donatives

Donatives were monetary gifts presented to members of the Roman military by triumphant generals or emperors. Originating in the Roman republic, they supplemented plunder as a reward for military service. Donatives frequently were associated with times of celebration (such as the triumph or imperial accession) or crisis.

In the Republic, donatives were traditionally given by the triumphant general at his triumph, though solid evidence is lacking before the late third century BCE. By the late Republic, we find generals giving donatives to secure the loyalty of their armies ([Caesar], *Gallie Wars* 8.4; Caesar, *Civil War* 1.39) and soldiers mutinying because they did not receive a donative,

as happened with Caesar's soldiers in 47 BCE.

These patterns continued into the imperial era, but the emperors also sought to make donatives a more regular and routine event. Although Tacitus (*Annals* 1.2.1) claimed that Augustus "seduced the army with gifts," that emperor provided only two donatives during his lifetime: the first to his veterans in 29 BCE, the second on the occasion of his grandson Gaius' taking part in exercises with the legions in 8 BCE. In his will (Suetonius, *Augustus* 101.2; Tacitus, *Annals* 1.8) Augustus provided what often has been called a donative for all soldiers, with the amount varying according to the status of the unit: the Praetorian Guard, located in Rome and responsible for the security of the emperor and his family, were granted the largest sum, 1,000 sesterces each, urban cohort soldiers 500 sesterces, and legionaries and perhaps auxiliaries 300 sesterces each. Yet, it is clear that this is technically a bequest rather than a donative. On the other hand, Suetonius (*Tiberius* 48.2) records that Tiberius doubled Augustus' bequest: the additional sum paid can be viewed as a donative by the incoming emperor to ensure future loyalty. Such grants, then, came to be expected at the accession of a new emperor. That these were not just bequests can be seen most clearly in the case of Claudius: after the murder of his predecessor, Caligula, Claudius gave a large grant to the Praetorian Guard which had placed him in power (Suetonius, *Claudius* 10.4) and he celebrated his accession date with a donative to the unit for the next several years. Grants on accession then became the norm, though on occasion, these were overlooked to the cost of the incumbent (Galba), or the amount given was nominal (Vespasian, Trajan). It is worth expanding on the episode of Galba (69 CE). Galba's supporter Nymphidius Sabinus promised the praetorians a donative, which Galba then refused to pay, saying, "I levy my soldiers, I don't buy them." Tacitus adds that the praetorians would have been satisfied with a token gift (Tacitus, *Histories* 1.5, 18). The praetorians, supporting the coup of Marcus Salvius Otho, assassinated Galba. Otho could not count on their support and offered them a large donative to assure loyalty (Tacitus, *Histories* 1.84).

Donatives on occasions other than at accession were infrequent. Under the Julio-Claudian emperors (14–68 CE), only six nonaccession gifts are recorded, one under Tiberius, two under Gaius one under Claudius, and two under Nero. Only three of these were to all soldiers: two by Gaius and one by Claudius. Those under Gaius seem to be associated with conspiracies, though it is difficult to tell for certain given the late date of the source

(Cassius Dio, writing in the early third century CE). A donative given by Claudius to all soldiers was on the occasion of his heir Nero's coming of age in 51 CE. On the other hand, the Praetorian Guard—and only the guard—are given donatives at times of crisis during these reigns: after the removal of the Praetorian prefect, Lucius Aelius Sejanus, in 31 CE (Suetonius, *Tiberius* 48.2); after Nero murdered his mother, Agrippina the Younger, in 59 CE; and after the exposure of a conspiracy to replace Nero with Gaius Calpurnius Piso in 65 CE (Suetonius, *Nero* 10.1; Tacitus, *Annals* 15.72; Dio 62[61]14.3). In each case, the grant to the praetorians was motivated by the close association of that group to the individuals involved or, in the case of the Pisonian conspiracy, by the involvement of so many of the officers of the unit itself. It is clear that these donatives were intended to ensure the loyalty of the rank and file of the guard, who had not been directly implicated in any of these episodes.

Evidence for donatives beyond this period is sparse: the *Historia Augusta*, a late source, suggests that they were given to all soldiers by Hadrian on his adoption of Lucius Ceionius Commodus (who became Lucius Aelius Caesar) in 137 CE and by Antoninus Pius on the marriage of his daughter Faustina to Marcus Aurelius in 145 CE (*Historia Augusta*, *Hadrian* 5.7, *Marcus* 7.9). The praetorians “auctioned” the empire in 193, promising to support the man, Didius Julianus or Sulpicianus, who could give them the largest donative.

In fact, it was only when the Severans came to power in the late second century that the number of grants increased: as a usurper, Septimius Severus paid out donatives to the soldiers upon taking power in 193 CE and after the final defeat of his two challengers, Pescennius Niger and Clodius Albinus, in 197 CE. (Dio 46.46.7, 76.1.1) His son, Caracalla, fond of playing the role of fellow-soldier, was said to have rewarded them on several occasions. The praetorians were singled out in particular after Caracalla's murder of Geta, his brother, in 211 CE (Herodian 4.4.7). In these cases, the reason for the grants seems to be to ensure continued loyalty for the dynasty. In the post-Severan period, donatives became more frequent, as contenders for power seduced the army to their side with huge sums, though these are not specified in the sources, only their size being noted. Though all soldiers benefited from these grants, the last known donative to the praetorians alone was given by the emperor Tacitus upon his accession in 275 CE. Donatives to other troops continued to be distributed in a more regular

fashion at the accession of emperors and at 5- and 10-year anniversaries.

Donatives therefore were a long-standing tradition that were used in particular by emperors to ensure the loyalty of their troops. The nature of the Principate meant that this type of gift was granted most often in association with events that could be viewed as either celebratory or disruptive to the empire as a whole. But the perception of the ancient literary sources—namely that the emperors bought their troops with frequent donatives—should be modified somewhat, given the irregularity of these rewards.

Drusus (38–9 BCE)

Brother of the emperor Tiberius (14–37 CE), Drusus Claudius Nero was a Roman statesman and general and member of the Julio-Claudian imperial family, holding the consulship in 9 BCE. Often called “Drusus the Elder,” to distinguish him from his nephew “Drusus the Younger,” Drusus was the son of Tiberius Claudius Nero (praetor in 42) and Livia. Drusus is noteworthy mainly for his conquest of Lower Germany for the Roman Empire.

Drusus was born after his mother Livia divorced Tiberius Claudius Nero and married the future emperor Augustus. Scandal suggested that Drusus was actually Augustus’ adulterous son by Livia, but his resemblance to his

natural father dispelled that rumor. Drusus' father died when he was four, so Drusus was raised in the household of Augustus, who regarded him with great affection. Drusus married Augustus' niece Antonia for love; according to Valerius Maximus 4.3.3, she was his sole sexual partner.

As a prince of the imperial family, Drusus received age dispensations to hold political office early. In 15 BCE, he and Tiberius conquered Raetia, a deed commemorated on silver and gold coinage. In the next few years, Drusus repeatedly attacked the German tribes across the Rhine. As consul in 9 BCE, Drusus campaigned against the Chatti, Suebi, and Cherusci, sacking and pillaging a great number of German villages as far as the Elbe River, for which he was awarded a triumph. But Drusus did not live long enough to celebrate it. Allegedly, a woman of superhuman stature confronted Drusus at the Elbe and warned him he would soon die. According to Dio, he died from an illness; in other accounts, he fell from his horse. Tiberius rode 200 miles nonstop to reach Drusus on the day he died (Dio 55.2.1; Pliny the Elder *Natural History* 7.20.84; Valerius Maximus 5.5.3).

Drusus' death was greatly mourned, especially by Augustus, who passed the rest of the year in deep grief. A funeral was held for him in every Roman town and city from Mogontiacum (Mainz) to Rome. A 20-meter high monument called the Drususstein at Mogontiacum commemorates his death. Drusus' mother Livia was awarded the rights of a woman who had three children (giving her greater legal privileges than ordinary women) as a consolation for her great loss. Tiberius performed a eulogy for Drusus in the Forum, and Augustus performed one outside Rome at the Circus Flaminius. Although he was not a true member of the *gens* Iulia, Drusus was buried in the Mausoleum of Augustus. He left behind three children, Germanicus, Claudia Livilla, and the future emperor Claudius. The Senate posthumously gave Drusus the *agnomen* Germanicus, which his descendants inherited. Velleius, Suetonius, and Dio recount his exploits.

Many modern scholars, based on the testimony of Velleius, Suetonius, and Dio, speculate that Augustus had decided to advance Drusus as his potential heir ahead of Tiberius. The affection Augustus showed for Drusus during his lifetime and the grief he felt at his death strongly argue in favor of this, especially when one considers the lukewarm relationship between Augustus and Tiberius. Suetonius says that Augustus specified Drusus as his heir along with Gaius and Lucius in front of the Senate. However, Drusus was one of many potential heirs to Augustus, including Augustus'

grandchildren, Gaius and Lucius, who also died prematurely. Drusus was also the name of Tiberius' son, who predeceased Tiberius (23 CE) and the name of a son of Germanicus.

Dura-Europos

Founded on the Euphrates by the Seleucid dynasty, ca. 300 BCE, this city in eastern ancient Syria was settled by the Macedonians, Persians, and Romans. Its name from the Aramaic "duru," meaning fortress, indicates the strategic value of the city. Archaeologists have unearthed a synagogue, a temple to Mithras and a Christian church, indicative of the variety in cultures occupying the site. The city was destroyed by the Sassanid Persians in the mid-third century CE when Shapur I took the city from Rome, employing chemical warfare (incendiary weapons made from sulfur and pitch) in the process. Dura-Europos is also the findspot for many documents relating to the Roman army in the early and middle third century.

Dux

In its earliest form *dux* (pl. *duces*), Latin “leader,” applied to any military commander, but generally referred to commanders of ad hoc units. By the third century CE *duces* appear within the Roman army, usually commanding forces composed of detachments from standing legions and assembled for specific military operations. The position of *dux* seems to have been institutionalized at earliest during the reign of Diocletian (284–305) and at latest later in the fourth century. In the *Notitia Dignitatum*, a list of the military and bureaucratic ranks of the Roman Empire compiled soon after 395 CE and revised early in the fifth century, *duces* appear as commanders of the *limitanei*, Roman military forces stationed in the empire’s frontier regions. As such, *duces* seem to have been subordinate to the *magistri militum*, or Masters of Soldiers, in the diocese (supra-provincial division) to which they were assigned. A *dux*’ sphere of authority is termed *ducatus*.

Although the exact powers and responsibilities of *duces* are unknown, they were probably responsible for policing the border regions assigned to them, responding to localized raids and military threats and, in the event of a major incursion, assisting the field armies in repelling attacking forces. Additionally, *duces* may have been responsible for gathering intelligence about potential threats in the regions for which they were responsible. In the late fourth century, a Roman *dux* collected rumors concerning the Hun attack on the Gothic kingdom in modern Ukraine and passed these rumors on to Constantinople.

E

Ebro, Battle of the (217 BCE)

The battle of the River Ebro (northeast Spain), fought in the spring of 217 BCE, was a naval confrontation between Carthage and Rome and formed part of the Second Punic War (218–201). The Carthaginian navy was commanded by Himilco and consisted of approximately 40 ships. Gnaeus Cornelius Scipio Calvus led the Romans at the helm of some 55 ships.

Victory over Carthage at the battle of Cissa (near mod. Tarragona) in 218 ensured Roman jurisdiction north and south of the River Ebro. While consolidating their position, the Carthaginian commander, Hasdrubal Barca, was raising a ground force and a navy to mount an expedition against the Romans north of that region. Scipio feared he would be outnumbered and therefore planned for a naval encounter.

On arrival, the Carthaginians anchored their fleet in an estuary of the Ebro. A lack of preparation, however, forced them to dispatch crews for provisions. This had left the Carthaginians exposed, and Himilco had no scouts checking for Roman ships. Meanwhile, Calvus was warned of their presence at the estuary. He manned his ships with selected soldiers and set off from Tarraco (mod. Tarragona) to attack the Carthaginian fleet. Hasdrubal attempted to warn his navy of their arrival, but by then it was too late. The Carthaginians were disorganized, inexperienced, and haphazard and it allowed a structured Roman fleet to nullify their movements. Ships were rammed and captured and the demoralized Carthaginian crews sought refuge among their army. The Romans proceeded to round up the remaining ships.

The battle of the Ebro was a decisive victory for Rome in context of the war. The Carthaginian fleet, considered superior to the Roman navy, was

left devastated. The defeat guaranteed Roman control of the Spanish Mediterranean coastline, ensuring open supply lines while, at the same time, being able to keep the Carthaginians in check.

Egypt, Roman

Previously ruled by the Ptolemaic dynasty, Egypt became a Roman province in 30 BCE after the battle of Actium (September 2, 31) in which Octavian defeated the forces of Antony and Cleopatra VII, the last Ptolemaic queen. Due to its strategic importance as a supplier of grain to the Roman Empire, the province of Egypt was governed by an equestrian prefect (titled *praefectus Aegypti*) rather than by a senator. Egypt's other high-ranking administrators and commanders, including commanders of legions, were also equestrian, appointed by the emperor. In the early first century CE it was unthinkable that an equestrian would attempt to usurp the imperial power. Later this was not the case. A usurper, Firmus, claimed the role of emperor in the mid-third century, and the revolt of another claimant was put down by Diocletian (ca. 297–298).

Egypt was garrisoned by three, later two, legions, a fleet, and various auxiliary units. Two legions and the fleet were stationed at Alexandria. Roman soldiers' main role was policing. The fleet patrolled the Nile River, which was the main north-south route through the province. Minor garrisons occupied mines and quarries in the Eastern Desert and patrolled

the land routes through the Eastern Desert to seaports on the Red Sea coast, guarding the lucrative Red Sea trade from Arabia and India. Soldiers might be called on to suppress rioting in Alexandria or banditry in the Nile Delta. Many documents survive concerning the Roman army in Egypt, both on papyrus (including soldiers' private letters to their families) and on ostraka, shards of pottery written on in ink.

More is known about social conflicts in Egypt than in other provinces due to the interest of Jewish authors such as Josephus and Philo of Alexandria, the survival of the *Acta Alexandrinorum*, and the survival of numerous papyrus documents. For their part, Romans of Rome had a poor opinion of Egyptians, regarding them as animal-worshippers and despising Egyptian immigrants to Rome. Alexandria, however, was a major center of Greek culture and its inhabitants were sensitive to insults. The Greek-speaking elite of Alexandria and the Jews of Alexandria were hostile to one another, breaking out into violent conflict during the reign of Claudius (41–54); his edict, the “Letter to the Alexandrians,” survives, urging them to cooperate. The emperor Caracalla (211–217) also had trouble with the Alexandrians. The *Acta Alexandrinorum* or “Acts of the Pagan Martyrs” (second/third ca. CE) are an apocryphal and probably fictionalized series of court transcripts, resembling Christian martyr acts, in which brutal Roman emperors tried and condemned Alexandrian notables, who defied and mocked their overlords.

The papyri, preserved by Egypt's dry climate, provide a relatively random sample of day-to-day administration at many levels, including corruption, crime, and poor farmers' resistance to taxation. Roman Egypt was a highly hierarchical society, with Roman citizens and Greek-speaking Alexandrians at the top, followed by the Greek-speaking inhabitants of other cities and towns; at the bottom were the Egyptian peasants. Egypt was also intensively exploited by the Romans. However, whether social conflict was worse in Egypt than in other provinces is uncertain; conflict may only be better attested.

Egypt became heavily Christianized and was one of the first areas to practice monasticism. The Egyptian Church adapted a written version of the Egyptian language, Coptic, that is still used today by the Coptic Church.

Elagabalus (Emperor) (218–222 CE)

The young emperor Marcus Aurelius Antoninus, known as Elagabalus (older form Heliogabalus), born ca. 203, reigned from 218 to 222. A pawn of Severan dynastic strife, he became one of Rome's most unpopular emperors due to his unconventional gender presentation and sexuality and promotion of nontraditional religion, and was assassinated after only four years of rule.

Elagabalus was the son of Sextus Varius Marcellus and Julia Soaemias Bassiana, a niece of Septimius Severus' wife Julia Domna. His original name was Varius Avitus Bassianus. He grew up in Syria, where he held the priesthood of the native solar deity Elagabalus (El Gabal) of Emesa.

After the assassination of Caracalla and the usurpation of Macrinus in 217, Elagabalus' grandmother Julia Maesa, the sister of Julia Domna, induced the soldiers to proclaim him emperor, changing his name to Marcus Aurelius Antoninus. This imperial nomenclature asserted a link to Caracalla, whose imperial name was also Marcus Aurelius Antoninus, alleged to be Elagabalus' real father, and to Marcus Aurelius. Macrinus, in contrast, had no dynastic connections.

The teenage Elagabalus was not, of course, the general of his army, but it defeated Macrinus' forces. Elagabalus entered Rome unopposed. His subsequent acts baffled and alienated the Romans. In 218, he brought the deity El Gabal to Rome and attempted to make this Syrian solar cult the chief religion of the Roman state, displacing the traditional Jupiter Optimus Maximus and angering the Senate. Elagabalus then divorced his wife Julia

Paula and married the Vestal Virgin Aquilia Severa. Elagabalus also conducted homosexual affairs with various men. The sources explicitly state that in his appearance and behavior Elagabalus violated expected sexual and gender roles, appearing effeminate and being penetrated by other men, conduct which was unacceptable to Roman sexual mores. Moreover, his male sexual partners, such as Aurelius Zoticus, were of low social status, offending the senatorial elite.

As a concession, the Senate forced Elagabalus to adopt as heir his cousin Alexianus (the later emperor Alexander Severus, 222–235) and to divorce the ex-Vestal. Subsequently the army, allegedly disgusted with Elagabalus' sexual behavior, revolted in favor of Alexander and Elagabalus was assassinated. Alexander Severus became emperor, though he was also young and as much a pawn of Severan dynastic rivalry as Elagabalus.

The reign of Elagabalus is described by Cassius Dio, who was a contemporary to events, and by the slightly later Herodian; the text of Dio has been abbreviated by the Byzantine compiler Xiphilinus. The *Historia Augusta* also features a highly unreliable life of Antoninus Heliogabalus, with extensive but fantastic detail: to take only one example, Elagabalus was so devoted to luxury that he caused a tall “suicide tower” to be built, surrounded by ornamented and jeweled boards, so that even his mode of death should be extravagant (*Historia Augusta, Elagabalus* 33.6).

Elite Participation

The Roman military officer cadre was partly bureaucratic in modern fashion, partly a quasi-hereditary military aristocracy. During the traditional Republic, men of the political class were accustomed to extensive

military service. For members of the senatorial order, the expectations and prevalence of service began to shift in the late Republic and changed markedly in the Principate. Many Roman elite officers, especially senators in the Principate, had little military experience, though they outranked the equestrian officers and lower status personnel. Due to the structure of Roman elite commands we refer throughout to “elite” or “lower-ranking” rather than “senior” or “junior” officers, as the latter terms might imply seniority-based promotion, let alone a modern meritocratic promotion structure.

In the traditional Republic, aristocrats (at first patricians, later the patrician-plebeian nobility) were expected to serve in the army and to lead as officers. In the *cursus honorum* or ladder of magistracies, military service was a prerequisite; a citizen had to serve 10 campaigns before he could run for office. Thus, in this period Roman men of the political class had almost all served in the army from the age of 17 (when recruits first became liable to serve) to 26. To seek a political career was to continue military service, for the two consuls were commanders-in-chief, accompanied by lower ranking quaestors (responsible for logistics and pay). The praetors were able to command campaigns in their own right, though usually less extensive ones. Magistrates might obtain promagistracies that enabled them to continue their campaigns for more than a year or to hold *provinciae* (regional assignments or theaters of war, later “provinces”) in other areas. The dictator was a sole commander-in-chief, appointed in emergencies, without a colleague. A Roman noble who held his magistracies in sequence aspired to hold the consulship at the youngest possible age, about age 42, while he was still vigorous, though many Roman consuls, praetors, promagistrates, and dictators were older.

Below the magistrates, the Republic’s military tribunes were partially elected by the centuriate assembly and partially chosen by the Senate from the population of young nobles (Livy 22.53.1; Plutarch, *Flaminius* 1.4). Consuls, praetors, and other commanders could also choose men (usually fellow nobles) as their deputies, termed *legati* (“chosen men”). *Legati* might act as envoys and diplomats, command troops up to legion scale, and advise the general. Ideally *legati* were experienced, but the general might be obliged by family ties, *amicitia*, or patronage to select inexperienced *legati* (Caesar, *Gallie Wars* 1.39–40).

The traditional republican nobility prized the quest for military glory

and fame (*gloria* and *laus*) through bravery and conquest. They admired courage (*virtus*) and individual prowess, celebrating Roman generals who defeated enemy leaders in personal combat and despoiled them of their armor. A measure of the prestige of courage is the fact that many mid-republican Roman nobles died in battle, especially during the Second Punic War when Hannibal nearly defeated the Roman Republic.

Roman commanders sought to earn triumphs, traditionally granted by the Roman Senate if a campaign had yielded at least 5,000 enemy deaths. The greatest triumphs celebrated far larger victories and displayed the wealth plundered from enemy communities. Triumphant victors redistributed such wealth to the Roman community via the construction of public works, temples, and victory monuments, and by expending wealth on the public at triumphs, feasts, and games. Even after his death, a victorious general's conquests lived on: his descendants wore his death mask and those of other distinguished ancestors at the funerals of members of the family and related their glorious deeds (Polybius 6.53.1–9).

Elite military participation began to decline in the late third and second centuries BCE, probably as the shift to overseas warfare promoted a more "professional" army led by a smaller number of prominent leaders and their officers. The Roman elite themselves stereotyped such decline as due to the nobility's increasing wealth, avarice, and luxury (Sallust, *Bellum Catilinae* 10–11). In reality, the decline in elite military participation in the late Republic was due to the ever-rising stakes of warfare. By the first century BCE, the command of wars had become a project that only a few leaders undertook, by virtue of their own wealth, prestige, followers, and military talent. Such leaders furthermore relied more upon their own picked *legati* than on the traditional military tribunes.

Furthermore, military success might entail a political trade-off; unless very well connected, a general who was away from Rome for many years might lose touch with his peers at Rome. It seems that Marius came to despise the political elite to which he had never really belonged (Sallust, *Jugurthine War* 85) and as dictator, Sulla chose to restructure the state by force. Caesar, who had spent 10 years conquering Gaul, termed the Roman state "a name merely, without body or form" (Suetonius, *Iulius* 77.1) and seems to have been caught unawares by the assassination conspiracy.

In the first century BCE, the requirement of 10 campaigns for office-holding seems to have lapsed. Young aristocrats required an extensive Latin

and Greek “higher” education, including forensic and political oratory, rhetoric, and philosophy, to pursue public careers. However, the militaristic values remained prominent, now attached to the late Republic’s great commanders, such as Pompey in Cicero’s *Pro Lege Manilia* (On the Manilian Law) advocating granting command of the Mithridatic Wars to Pompey in 66 BCE.

Nonetheless, due to the turnover in republican noble families as a result of decades of civil strife, the militaristic family tradition celebrated by Polybius (above) seems to have weakened. This turnover continued through the first two centuries of the empire. The senatorial aristocracy failed to perpetuate itself and was constantly supplemented by the promotion of families from below.

In the Principate, the emperor monopolized the role of commander-in-chief, though many emperors delegated field command to imperial family members. The emperor was hailed as *imperator* (victorious general) and maintained a close relationship with the army. A senator who sought to do these things was likely to be accused of sedition and revolt. However, many senatorial officers did serve as commanders without incurring the imperial jealousy emphasized and perhaps exaggerated by literary authors. It is not clear that these men, the so-called *virī militares*, constituted a distinct faction or social group. Elite literary authors continued to support the military values, praising emperors who undertook imperialistic wars. Elite authors also disparaged emperors who did not wage wars. In the *Annals* Tacitus apologizes for the military inaction of the emperor Tiberius, contrasting the heroic wars of Rome’s past with the early empire’s sordid civilian intrigues (Tacitus, *Annals* 4.32).

Augustus (27 BCE–14 CE) rearranged the structure of provincial governorship and legionary command to discourage revolt and usurpation by senatorial commanders. “Imperial” provinces were separated administratively from “public” ones. “Public” provinces did not contain legions and were governed by proconsuls (now used as a title, even if the appointee had not been consul), appointed by lot. These provinces were peaceful and mostly interior to the empire, such as Sicily and Asia. In contrast, imperial provinces had active frontiers. Imperial provinces were governed by *legati Augusti pro praetore*, senators who had held the office of praetor (sometimes consul), appointed by the emperor. These governors commanded legionary legates, the commanders of individual legions. The

emperor had ultimate authority over command in imperial provinces, and might deputize a relative as field commander or take the field himself. To further prevent usurpations, Egypt (a major supplier of grain to Rome) was governed by an equestrian prefect, too low in status in the early empire to be a suitable candidate for the purple.

Senatorial aristocrats usually served a year as laticlavian tribune (*tribunus laticlavius*), a rank for young men (under 25) who had not yet entered the Senate. The laticlavian tribune was notionally second-in-command to the legionary legate (the legion's commander) and outranked the legion's equestrian tribunes. Many senatorial aristocrats did not serve further in the army but went on to civil posts. A few senators held repeated tribunates and later became legionary legates and subsequently governors of imperial provinces. However, the governorship of a "public" province was much more prestigious, involving wealth and influence. Whether the emperor's jealousy and suspicion discouraged senators who became governors of imperial provinces from pursuing military glory depends on generalizing some instances in Tacitus (*Annals* 11.20, *Agricola* 39–40) and Pliny the Younger (*Letters* 8.14). Surviving career inscriptions on stone show that senatorial aristocrats could hold military commands and display military competence without risking imperial wrath.

Senatorial aristocrats might also avoid active military command (beyond the year as a laticlavian tribune) because of their contempt for common soldiers (*milites gregarii*), an attitude most prominent in Tacitus and Cassius Dio, who depict common soldiers as uneducated and brutal, motivated by greed and unable to control anger. A senator with such attitudes who commanded a legion would find it hard to win the affection of his men, even if such affection did not incur imperial suspicion that he was courting usurpation. Cassius Dio, governor of Pannonia in the 220s, despised the Pannonians as semibarbarians (Dio 49.36.2–4; cf. 74[75]2.6); subsequently the praetorians, who remembered his attitude, forced him to surrender his consulship (80.4.2).

Members of the equestrian order served and were promoted in the Roman army much more consistently. They usually entered the army as prefects (commanders) of auxiliary units, as narrow-stripe (angusticlavian) legionary tribunes ranking below the laticlavian tribune, and sometimes as legionary centurions. The *militia equestris* sequence was prefect of an auxiliary cohort; angusticlavian tribune; prefect of an *ala* (cavalry unit). In

the first century CE, equestrian officers were usually Italians or provincial Roman citizens from north Italy, Spain, or southern Gaul; by the late second and third centuries CE, they were provincial citizens from the frontier provinces.

Equestrian officers dominated the army in the middle third century CE, when senators no longer sought or were chosen for military commands. By the mid-third century, the senatorial titles of *legatus Augusti pro praetore*, proconsul, and legionary legate were disused and the equestrian commander of a region or governor of a province might be termed *dux* or *praeses*. The mid-third century CE, a period of peril for the empire, was a golden age for equestrian officers, many of whom rose to the highest commands. Gallienus (260–268) may have taken the step of depriving senators altogether of military commands, though this is disputed.

In the later empire (284–476), civil and military appointments were separated. The senatorial order was renamed the clarissimate; a senator was termed *vir clarissimus* (most distinguished man) and was eligible for largely honorific civil posts. Military officers and commanders were men from equestrian-equivalent status or, increasingly after 378, the nobles of non-Romanized ethnic groups. Promotion within the army was based on seniority.

Emperor as Commander

During the Republic's long centuries of conquest, Roman armies had often hailed their commander, a man from one of the ruling senatorial families, as *imperator*, or "victorious general." When the republican system, which shared such military glory among Rome's aristocrats, began to fail, it was largely because a few victorious generals had become so powerful that they subverted the loyalties of the armies from the state to themselves. After the civil wars of the first century BCE, there was only one *imperator*—the man we call the emperor. From Augustus, and regularly from Vespasian, each new ruler took *imperator* as his new *praenomen*, or first name, and with it took on the challenge of commanding the Roman army—his army. Without an effective army, his empire was in danger; without a loyal army, his reign might be short. Even if he did not command in person, and few and first- and second century CE emperors did, he promoted his public image as a commander. In the third and fourth centuries CE, however, many emperors commanded in person and several were killed or captured in combat.

This article will survey several aspects of the emperor's role as commander, although it can be difficult to generalize about a relatively informal system, a personal relationship between army and commander-in-chief that changed (sometimes drastically) with each new emperor. While this thematic treatment will focus on the first and second centuries CE, the last paragraph provides a diachronic sketch of the changes that occurred between Augustus and the late Roman Empire.

When Augustus finally brought the decades of civil war to a close, he had a unique opportunity. Rome had ruled an empire for more than two centuries, but he was the first emperor, the undisputed commander of the

armies that had won that empire. Augustus' central achievement was to create a stable army, replacing the highly personal loyalty of the soldiers to one warlord or another with an institutional loyalty to the emperor's person.

But the first problem was money. In the mid-Republic, veterans had been given land after victory or upon retirement, but in the late Republic this practice became a source of conflict when generals such as Sulla and the Second Triumvirs confiscated land from their enemies to give to the soldiers. To fund veterans' pensions without making confiscations, Augustus established the *aerarium militare*, a treasury seeded by his personal wealth and supported by a tax on inheritances. His decision to pay serving soldiers a steady and relatively low wage while using the treasury to ensure the payment of large cash bonuses at the end of a legionary's period of service (20–25 years) transformed army service from an opportunistic gamble into a decent career. As the system developed, the old practice of generals giving donatives (cash gifts) to their soldiers became routinized as well. Soon, all donatives came from the emperor, and normally they were paid only in honor of imperial events, such as imperial accessions and their anniversaries. Usurpers might also exploit the custom of accession donatives to win supporters.

This might seem to be a brilliant innovation: a pseudo-modern professional military conjured into existence to replace a chaos of competing war bands. There is some truth to this view, but Augustus built his new institution along traditional lines, namely the old Roman system of patronage. What might seem to be a corrupt system of promotion or an institutionalization of bribery was in Roman eyes an acceptable way of recognizing the personal, reciprocal bonds between a patron and his many clients. In this manner, the emperor became the sole patron of every serving soldier. While the emperor gathered all of the old sources of Roman martial glory to himself—the triumph, the taking of victory titles, the right to supreme command—he paid for it by providing financial stability to several hundred thousand soldiers.

As the empire passed into the hands of Augustus' successors, the bonds between the soldiers and their ultimate commander were emphasized in a number of ways. Soldiers now swore the military oath directly to the reigning emperor, which was probably often repeated on paydays and holidays. Just as emperors might reward outstanding individual service with

decorations and promotions, entire units were bound to an emperor or his family through gifts and honorific unit titles, and every unit carried portraits of the emperor. The remarkable military calendar known as the *Feriale Duranum* (the Festival Calendar from Dura-Europos, a third-century CE military base in Syria) testifies that first century imperial birthdays were still celebrated by an auxiliary unit serving on the banks of the Euphrates two centuries later. Even the coins that paid a soldier's salary bore the image of his commander-in-chief, and were likely to feature slogans emphasizing the closeness of emperor and army. Despite the social and geographical separation between an emperor and his soldiers, some emperors made much use of the term *commilito*, or "fellow soldier," and every emperor was expected to address his troops from time to time, an event known as an *adlocutio* in which the emperor delivered a formal speech to his men, usually praising and exhorting them to raise morale.

Just as the *adlocutio* recalled the prebattle speeches of battlefield commanders, there was pressure on the emperor to act the part of an old-fashioned Roman military leader. Claudius, a most unmilitary emperor, traveled all the way to Britain to be able to claim a personal triumph, but even emperors with previous command experience cultivated the reputation of a "fellow soldier." As a younger man Galba had run for 20 miles with his troops, carrying a shield; as emperor, though now an old man, he appeared at the head of his troops, carrying a sword. Trajan marched on foot, fording rivers alongside his infantry; Hadrian kept his head uncovered on the march, in fierce sun and snow alike. Here too there was symbiosis: soldiers appreciated an emperor who made the effort to share their hardships, and emperors without victories of their own basked in the reflected glory of their legions. Amidst the praise emperors also emphasized maintaining discipline, but this was largely a sop to the senatorial aristocracy who objected to the army's increased influence—even if the emperor blustered about keeping the army in line, it was understood that when push came to shove senators were dispensable and legions were not.

In reality, of course, the emperor could only very rarely lead his far-flung troops in person. Senators commanded legions, as they had always done, but now they were rotated through different regions, rarely spending more than a year or two with the same troops. The system worked well: soldiers were provided for without confiscations, and the senators could still compete (albeit in a much more restricted way) for military prestige without

much chance of earning the personal loyalty of the troops under their command. Those senatorial commanders who broke these customary rules, as did Gnaeus Calpurnius Piso, the alleged murderer of Germanicus, paid the price for perceived treason. Still, the rule of Rome depended only on the army—however much Augustus politely played down this fact—and a very unpopular emperor or the sudden end of a dynasty meant that either a provincial army or the Praetorian Guard (the chief troops in the city of Rome) would become kingmakers.

In the two centuries after Augustus major campaigns were relatively rare, yet the emperor did occasionally take the field at the head of his army. First- and second-century CE emperors were not expected to actually fight in the front, endangering their persons, but they might take an active part in directing the battle. Like any senatorial commander, they rode behind the battle lines, making dispositions and deciding when to commit reserves to combat. During sieges it was considered good leadership to be seen courting the (slight) danger of long-range fire from the enemy walls, and to remain close enough to the action to personally witness the heroic exploits of assault troops. Active leadership was good, but all understood that “no one demands that a general should risk his life in fighting like a common soldier,” in the words of Plutarch’s *Life of Pelopidas*, a biography of a fourth-century BCE Greek general in which Plutarch voices the attitudes of a citizen of the Roman Empire. Trajan is the exemplar of this approach, and the column commemorating his Dacian Wars shows him constantly in the presence of his army. He leads the religious rites, he rewards his soldiers, he directs siege and river-crossing operations, and he makes speeches—but when he is in range of enemy weapons he is protected by his shield bearers.

Trajan represents an ideal performance of “emperor as commander,” but the demands of the role were always changing. The Julio-Claudian emperors stayed in or near Rome, and only Claudius and Gaius (Caligula) appeared on campaign, each for unusual reasons. But the Flavian claim to rule rested largely on the military success of Vespasian and Titus, and subsequent emperors generally made a habit of visiting their armies in the provinces. Hadrian did not lead a victorious campaign but he toured constantly, and an inscription records the speeches he made while inspecting an outpost in North Africa—model *adlocutiones* in which he emphasized his connection to the army and displayed his familiarity with the individual units he addressed.

Toward the end of the second century, when barbarian pressure on the frontiers increased, emperors were increasingly on hand with an army. In 193, there was a chaotic scramble for power which featured two senators shouting to outbid each other for the support of the Praetorian Guard. The troops had acclaimed new emperors before, but this “auction of the empire” was seen as very shocking, and suggested the long corrosion of the Augustan modesty that had de-emphasized the political role of armed force. Not long after, Septimius Severus is supposed to have told his sons to “enrich the soldiers, and despise all the rest,” in the words of Cassius Dio. One of these sons, Caracalla, so fully identified with the army that he carried a standard on the march and wanted soldiers to address *him* as “fellow soldier.” The rest of the fiction was stripped away, and during the series of invasions and civil wars that marked the middle of the third century, most Roman emperors were little more than briefly supreme generals, leading their armies in person and ruling by right of conquest. The emperor Maximinus Thrax (235–238) represented the next logical step in this time of crisis: not only was he a soldier of humble birth, but, even after becoming emperor, he rode into battle with his troops, killing with his own hand. The emperor Decius (249–251) died in battle. The emperor Valerian (253–260) was captured when his army was defeated by the Persians in 260. Although Diocletian and the Tetrarchy restored order to the empire in the late third century, the pattern that emperors might fight in combat persisted in the fourth century; Constantine the Great’s rival Maxentius perished in the battle of the Milvian Bridge (312). In 363, the pagan emperor Julian, attempting to imitate Alexander and numerous Roman emperors in defeating the Persians, died from a wound received in battle. The emperor Valens died in the battle of Adrianople (378), one of Rome’s most notorious defeats. Even the most powerful of the later Roman emperors was dependent on the ever-uncertain loyalty of his soldiers and rarely far from a major field army.

Emperor as Patron

The reality of the imperial army was that the emperor, as at least symbolic commander-in-chief, maintained a special relationship with the army, on which his power depended, a relationship resembling patron and client in Roman society. His soldiers were also dependent on him; many soldiers were poor men, though the socio-economic status of recruits may have risen slightly in the imperial period as more men were recruited from assimilated, and thus moderately well-off, provincials.

This relationship was emphasized throughout soldiers' service. The soldiers took oaths to the emperor and received their pay at least partially as coin minted in his name and depicting his likeness. The emperor might address his soldiers in person, praising them, and give them donatives (bounties of coin) or other privileges. Emperors who provided their soldiers with benefits earned the cooperation of the army, while emperors who withdrew benefits, as Galba did in 69 CE by refusing the Praetorian Guard a promised donative, risked revolt or assassination.

The relationship between emperors and soldiers was a reciprocal one resembling the traditional relationship of patron and client in Roman society: the patron provided for his dependent clients, and the clients returned the favor with loyalty and services. This patron-client relationship between commander and soldiers is thought to have developed during the late Republic when many legionaries were now recruited from the landless poor and the most prominent commanders were extremely wealthy oligarchs. Pompey the Great is an example; as a young man, he raised three legions from his family's clients in Picenum.

However, the patron-client model is not entirely satisfactory as an explanation of the imperial army's social dynamics. Traditional patrons did

not depend on their clients to maintain their social status. Furthermore, the Roman emperors had also to satisfy a third group, the Senate or, more broadly, the educated urban elite (in Rome and other cities). This aristocratic group disapproved of the emperor's too obvious indulgence of the army and of the army's threat of revolt. The emphasis on military discipline in imperial literature (including narratives and anecdotes of the traditional Republic) probably represents the imperial aristocracy's disapproval of the patronage dynamic between emperor and army. In this model of military discipline, emperors and senatorial commanders did not show the army special favor, and took a leading role in inculcating their soldiers to endure hardships in training and on campaign. In practice, however, skillful emperors adopted both roles; they provided their soldiers with benefits and they upheld traditions of military discipline.

Both emperors and senatorial commanders also had reason to provide a counterweight to the patronage model of military command because it offered too easy a route to power for usurpers. This is seen in the "War of Four Emperors" (69 CE) in which the historian Tacitus, our main source for the war, depicts Marcus Salvius Otho and Aulus Vitellius as rising to imperial power through their patronage of the army, Otho bestowing favors on the praetorians and Vitellius on the Rhine legions. That this dynamic was not merely an imperial historian's construction is seen in the document titled the *Senatus Consultum de Cn. Pisone Patre* (20 CE) in which the Senate of Tiberian Rome condemned one Gnaeus Calpurnius Piso, governor of Syria, for attempted conspiracy. The decree of the Senate depicts Piso as courting the favor of the army in Syria, and is supported by Tacitus' account of the same episode (*Annals* 2.55). If senatorial commanders wanted the emperors to trust them, they needed to avoid excessive emphasis on the role of patron with their soldiers. In practice, this line may have been narrow. Documents from Vindolanda (around 100 CE) on Hadrian's Wall in northern Britain show that when soldiers petitioned their commander, an auxiliary prefect, for leave, they adopted the subservient terminology a client might use.

Empresses

The wife of a reigning emperor received the title *Augusta*, but lacked formal military, political, or judicial powers. Their absence was due to the political structure of the traditional Republic, in which men monopolized political office and military commands, and the development of the emperor's role, an outgrowth of the acclamation of victorious generals. The power of an empress was personal and depended on her influence with the emperor and with other powerful men in Rome. The Augusta was also wealthy and acted as a patron, able to dispense material favors as well as influence. However, her lack of formal political power meant that if she wished to wield political power, she might support male relations as puppet emperors. This article discusses empresses in a Roman cultural context, excluding Zenobia of Palmyra (sub vid).

The first empress termed *Augusta* was Livia, the wife and then widow of Augustus, mother of Tiberius (14–37 CE). She commanded vast influence and respect. Tacitus' *Annals* depict her as virtually a power behind the throne of Tiberius. She was rumored to have engineered the succession of Tiberius over Augustus' previous choices, family members who all predeceased Augustus. However, she maintained the public image of a traditional Roman matron.

Notable empresses after Livia included Agrippina the Younger, a daughter of Germanicus, sister of Gaius (37–41), and later wife of Claudius (41–54) and mother of Nero (54–68). Tacitus' memorable but biased portrait of Agrippina emphasizes her dominating personality and her influence over

and control of the elderly Claudius (whom she allegedly poisoned) and her underage son Nero. Nero eventually tired of his mother's domination and had her assassinated, killed by Roman soldiers after a botched attempt to drown her in a boating accident.

Other empresses who were prominent and influential were Julia Domna, the wife of Septimius Severus (193–211) and her nieces Julia Soaemias, mother of Elagabalus (218–222) and Julia Mamaea, mother of Alexander Severus (222–235). The hostile sources, the contemporaries Cassius Dio and Herodian, depict Soaemias and Mamaea as manipulating the army and powerful interests to support the accession of their teenage sons, and then as governing behind the scenes.

These empresses were particularly notorious because, in male-dominated Roman society, they gave offense by seeming to be more powerful than men; male historians such as Tacitus, Cassius Dio, and Herodian gave them a bad press. It is a useful check to examine the documentary sources for their reigns.

The last extremely prominent empress was Galla Placidia, the daughter of Theodosius I (379–395) and sister of Arcadius (395–408) and Honorius (395–423), the power behind the thrones of Honorius and her son Valentinian III (425–455). Galla Placidia was caught up in the turbulent events of the early 400s, being kidnapped by Alaric at the sack of Rome in 410 and, after Alaric's death, married to his brother Athaulf; then wife to Constantius III, a short-lived Roman emperor and father of her son Valentinian III. Galla Placidia ruled in the name of Valentinian III from 425 to 437. As Galla Placidia could not be a military leader, and neither Honorius nor Valentinian III (even after their minorities) were effective leaders, the western Empire depended on a series of unrelated commanders-in-chief (*magistri utriusque militiae*), most notably Flavius Aetius. In the eastern empire, Pulcheria, the sister of Theodosius II (408–450) also wielded great influence over her brother and the court.

Many empresses were able to exert influence more covertly. The mainstream role of an empress, which the women discussed above also fulfilled, was dynastic and religious. She presented the virtue of marital *concordia*, or harmony and fidelity. Her role as faithful spouse ensured a stable dynastic succession, in an imperial dynasty, or sealed adoptive successions with linkage by marriage, in cases of adoptive succession. (For instance, in the Tetrarchic designation of the Caesars Galerius and

Constantius I, these men married the daughters of the Augusti Diocletian and Maximian.) For these reasons, imperial historians and biographers exposed the infidelities of empresses such as Messalina (the previous wife of Claudius) and Faustina the Younger (wife of Marcus Aurelius). The Augusta also took part in Roman religious ceremonies appropriate to elite women; after the conversion of Constantine, some of the empresses were highly influential with Christian bishops.

Equites, Equestrians

The *equites* (singular, *eques*) or equestrians were the second most prestigious of the Roman orders or social strata, ranking below the senatorial order. The *equites* originally were cavalry, termed *equites equo publico*, or “horsemen granted horses by the people.” By the last century of the Republic, the associations of *equites* with cavalry service had broken down due to military reorganization and the growth of the order. Equestrians now denoted a well-to-do middle social stratum, below the Senate and nobility, from which senators might be recruited. In the late Republic and empire, equestrians became the backbone of the government and officer corps; in the third century CE, equestrians dominated the government and officer corps, replacing senators as governors of provinces, before equestrians as a category faded away in the fourth and fifth centuries CE. *Equites* or equestrians are not best translated “knights,” a term with anachronistic medieval connotations.

In the Classical Mediterranean, horseback riding and cavalry service were usually aristocratic activities. The archaic Roman *equites* were a privileged Servian census class, granted horses at public expense and occupying 18 *centuriae* in the assembly. One of the duties of the censors was to regulate the composition of the equestrian order, summoning the *equites* to a parade on horseback (*transvectio equitum*) on July 15 and observing whether the men and their horses were fit for military service. At this time *equites* numbered from 300 (archaic) to 1800 men, required to serve in the army for 10 campaigns.

However, this narrow definition of the *equites* broke down by the last two centuries of the Roman Republic. The reorganization of the Roman legion from maniples into cohorts reduced the need for cavalry. By the mid-first century BCE, allied forces (*auxilia*) were used for cavalry. The *transvectio equitum* lapsed as a ritual. The equestrians developed into a much larger group of well-to-do landowners (they still were required to own property equivalent to 400,000 HS), businessmen, tax farmers, and friends and assistants to the Roman governing class which was still dominated by the senatorial order. Senators and wealthy equestrians might socialize in the same circles and intermarry. However, the ongoing struggle over whether senators or equestrians should serve in the jury panels for the criminal courts (*quaestiones perpetuae*) that tried magistrates for extortion, differentiated senatorial and equestrian interests, and brought them into conflict. The equestrians were not a unified group and cannot be viewed as opposing the Senate *en masse*, though Sulla in his proscriptions targeted wealthy equestrians and promoted the interests of the Senate.

When Sulla, Caesar, and Augustus sought to fill the ranks of the Senate, they promoted equestrians to senatorial rank (a power originally held by the censors). Such equestrians were “new men” who had not held magistracies in earlier generations. Many came from Italian towns and cities outside Rome. Augustus differentiated senators and equestrians more sharply, requiring senators to possess 1,000,000 HS in landed property, while equestrians required only 400,000; senators and equestrians were assigned to different seating in the games and theater. Augustus also restored the *transvectio equitum* parade, though obviously not all equestrians could participate (many lived outside Rome) (Dionysius *Roman History* 6.13). Through the promotion of equestrians into the senatorial order and common citizens into the equestrian order, the emperors assured a constant flow of

provincial Roman citizens into the governing class of the Roman Empire.

In the Principate, equestrians entered the imperial service both as civilians and as military officers. As civilians, they might become imperial secretaries with major responsibilities, carrying out the day-to-day central administration of the empire. These secretaries were the emperors' freedmen in the Julio-Claudian period, but soon were replaced by equestrians, a group less resented by senators. The *ab epistulis* managed the emperor's correspondence, including diplomatic relations with many communities; this prestigious post required literary polish in both Latin and Greek. The *a rationibus* managed imperial finances, taxation, and expenditures. Other secretaries assisted the emperor with the formulation of legal opinions. Subjects wrote to the emperor asking for legal advice, and the emperor (or his secretaries) issued replies (*rescripta*) which functioned somewhat like modern case law, establishing precedents.

The most important civilian post in the Principate was the praetorian prefecture. The praetorian prefect commanded the Praetorian Guard but became the emperor's deputy for civilian administration. The praetorian prefecture was held by equestrians, and the first equestrian to become emperor, Macrinus (217–218), was the emperor Caracalla's praetorian prefect (Dio 78.41). (Pertinax, emperor in 193, was born an equestrian but had been promoted into the Senate.) The risk that the prefect would usurp the emperor's place continued into the mid-third century, with usurpations by Philip (244–249), Carus (282–283) and Aper (284, a would-be emperor slain by Diocletian, emperor 284–305). In the provinces, equestrians might hold the office of *procurator* in the financial administration, but only one major province, Egypt, had an equestrian governor, the *praefectus Aegypti* (Tacitus, *Annals* 2.59; Dio 51.17). Because Egypt was a major provider of grain to the empire and to the city of Rome, a senatorial governor of Egypt would be a risk for usurpation.

Equestrians also dominated the higher ranks in the imperial legions, though senators still monopolized the highest ranks in the first two centuries CE. Proconsuls and legates were of senatorial rank, as was the *tribunus laticlavus*, the broad-striped tribune, a young man (under 25, a senator's son but not yet senator). The *tribunus laticlavus* formally outranked the equestrian *tribuni angusticlavii* (narrow-striped tribunes), who however were mature men with longer service. Centurions might also begin as equestrians, obtaining their centurionates by patronage. A minority

of centurions attained equestrian rank through long service: a centurion who was promoted through the hierarchy of centurions, attaining the rank of *primus pilus*, became an equestrian on his discharge from the army. Some *primipilares* (former *primi pili*) continued in military service, holding the rank of *praefectus castrorum* (camp prefect), an important officer in charge of logistics. Other *primipilares* might enter the civilian administration at the level of procurator. The *praefecti* of auxiliary units (infantry or cavalry), commanding these units, were also equestrians.

The “third-century crisis” (235–284) is traditionally seen as a period when the emperors excluded senators from military commands and provincial governorships, promoting equestrians as governors and legionary commanders. The promotion of equestrian commanders began earlier; Septimius Severus (193–211) created three new legions, I–III Parthica, commanded by equestrians, and appointed an equestrian governor of the new province of Mesopotamia (Dio 75.3.2). The exclusion of senators may have been informal and regarded by contemporaries as temporary. The third-century emperors stereotyped as lower class peasants by contemporary writers such as Herodian and by later fourth-century authors were probably provincial equestrians. In the fourth and fifth centuries, the status of equestrian died away as it mattered less than holding office in the enlarged government and army. Advance in civilian or military rank conferred wealth and prestige equivalent to equestrians and senatorials.

Equites Singulares Augusti

The *equites singulares Augusti* (singular: *eques singularis Augusti*) were an elite cavalry unit which guarded the early Roman emperors. Started by Domitian (81–96 CE) or Trajan (98–117), they replaced the earlier semimercenary “German bodyguard” (*Germani corporis custodes*) who had been tasked with keeping first-century emperors safe. Somewhat like their predecessors, the *equites singulares* were initially recruited from the Batavi and Ubii, Germanic peoples in the Rhineland who had a strong cavalry tradition. By the Severan era (ca. 200), as with the praetorians, they were largely recruited from militarized frontier zones around the western Danube River that provided much of Rome’s auxiliary *alae*. By this period they also came to number 1,000 or, more probably, 2,000, and occupied a notable camp in southeast Rome, the *Castra Nova* (new camp). The camp today lies under the St. John Lateran papal basilica complex.

There is a good deal we do not know about the *equites singulares Augusti*’s service and command structure, but they do not seem to be simply the cavalry of the Praetorian Guard, which had its own mounted units. Nor, of course, were the *equites singulares Augusti* always on their horses; especially in Rome, the nature of their service would have afforded limited opportunities to ride. Besides keeping the emperor safe and accompanying him on journeys, *equites singulares Augusti* (like praetorians) were sometimes sent out on policing missions against bandits and other problems, especially in Italy but occasionally the provinces as well. Constantine disbanded the *equites singulares Augusti* along with the praetorians when he took Rome in 312.

Cavalry guards with similar titles also served some Roman provincial governors.

Etruria, Etruscans

The region of Etruria comprised the core geographical area of the Etruscan civilization, which flourished between the ninth century and fifth centuries BCE in central Italy. Etruria's geographical borders are the Arno and Tiber rivers to the north and the south, and the Tyrrhenian Sea and Apennine Mountains to the west and east. As early as the eighth century BCE Etruscans began colonizing other parts of Italy. These extensions reached northward to the Po Valley and southward into Campania. Etruscan city-states resembled Greek city-states in their development as autonomous political units containing both urban areas and the adjacent agricultural hinterland. Many archaeologists consider Etruscan civilization to have been the most advanced civilization of the western Mediterranean during its height. This cultural ascendancy is due most significantly to Etruria's mineral-rich and fertile land. The excellence of Etruscan metalworking, shipbuilding, and masonry enabled the Etruscans to dominate trade.

The Etruscans are an under-represented people in the historical record as almost no original literary sources in the Etruscan language are extant. Our main sources of information are derived from archaeological excavations of Etruscan cities and necropolises, and from the writings of later Romans. Since the Romans conquered the Etruscan city-states, these literary sources are written with a pro-Roman bias giving the superficial impression of the Etruscans as a perpetually hostile enemy to Rome.

The dearth of Etruscan literary sources causes their language to remain largely unknown to modern scholars except from brief and tantalizing inscriptions. Etruscan is not a member of the Indo-European language family and thus has traditionally been considered an isolate language, unrelated to others. The origin of the language and its people has frustrated scholars for centuries. Origin theories include the possibilities of migration from either the eastern Mediterranean, from northern Alpine regions of Europe, or that these were truly an indigenous people.

After the Roman conquest of Etruscan territory, Etruscan civilization (itself heavily influenced by Greek civilization) became submerged in Italian

and Roman culture, largely disappearing by the first century BCE. Nonetheless, Etruscan civilization had some important influences upon Roman civilization, providing loan words and religious practices such as haruspicy, the ritual inspection of the livers of sacrificed animals to reveal portents.

Etruscan Wars

Early Roman engagement in war with the Etruscans was a major undertaking that would have significant repercussions on Roman expansion. The Romans had no notion of a planned, unified war against the Etruscan people. Rather, the military endeavors against the city-states of Etruria were discrete reactions to an array of individual factors and events.

The Etruscans themselves never united in a large-scale war against the growing strength of Rome. The legendary league of 12 Etruscan peoples evidenced no desire to unite militarily. Aware of their impotence against the might of a confederated Etruria, Romans exhibited anxiety at this prospect that never came to fruition. The only evidence of cooperation was city-states that would form occasional alliances with each other to face the threat of Rome. Early Romans were at a distinct disadvantage compared to their adversarial neighbors. The thoroughly developed Etruscan city-states had military experience and ample resources to contend with the blossoming threat of Rome.

The Etruscan Wars fought by Rome began as a clash of neighbors who

inhabited opposite banks of the Tiber River. This proximity was a motivating factor for both parties to engage in warfare. The closeness and shared geographical resources of these two peoples drove them to conflict. The Tiber, which served as the boundary between these two civilizations, was crucial for interior access to the peninsula and the salt beds at the river's mouth were highly valuable. The Etruscan cities of Caere, Fidenae, and Veii all relied on access to these resources as well as on trade routes to Campania and thus were keen to defend their position from the new Latin city.

Throughout Rome's infancy it was the Etruscan cities, particularly those closest to the Tiber River, which incited war. The Etruscans, having been the dominant culture in Italy for centuries, were not complacent to the looming threat of Rome's unrestrained expansion. As such, it was the city-states of southern Etruria that engaged in the earliest confrontations. The inhabitants of northern Etruria did not challenge the Romans until the southern stronghold of Veii was conclusively defeated.

The Etruscans were inclined to avoid the battlefield and seek less traditional tactics to inflict damage. Raids on Roman lands became a frequent method of instigating hostilities. Etruscans showed willingness to capitalize on Roman preoccupation. Whether distracted by wars with other Italian tribes or crippled by pestilence and famine, Etruscan cities, like Veii in 436 BCE and Tarquinii in 397 BCE, sought these opportunities to initiate conflicts with Rome.

The most significant conflict in these wars happened between Veii and Rome. It began slowly with sporadic raids on the Roman countryside. This conflict culminated in the final episode between Veii and Rome with the besiegement of Veii for 10 years, from 406 BCE and 396 BCE. According to legend, the Roman dictator Marcus Furius Camillus ordered a tunnel built to sack the city from inside its own gates. Though the Etruscan cities of Capena and Falerii offered their aid to Veii, it was not enough to contend with the tenacious Romans.

After the fall of Veii, other southern Etruscan cities engaged in war with Romans and one by one were defeated in conflict. The remaining Etruscan cities, most of which inhabited northern Etruria, were increasingly vulnerable after the fall of southern Etruria. Throughout the fourth and third centuries BCE Roman commanders such as Camillus and Quintus Fabius Maximus made forays into the heart of Etruria. Once powerful

strongholds such as Arretium, Perugia, Rusellae, Tarquinii, and Volsinii were defeated and their autonomy lost. In 295 BCE, the Etruscans threw in their lot with the Samnites in a famous alliance of Samnites, Etruscans, Umbrians, and Gauls. This coalition was defeated by the Romans in the battle of Sentinum.

Rome's Etruscan Wars were not a simple process of expansion into barbarian-inhabited lands. Etruria was home to a thriving civilization that did not willingly forfeit their independence. Throughout centuries of conflict, Etruscans dealt the Romans frequent defeats, but eventually they succumbed along with the rest of Italy into the hands of the Romans.

The Etruscan Wars played a significant part in expanding Rome's sovereignty throughout the Italian peninsula. The incorporation of Etruscan city-states into Rome's dominion represented the end of political autonomy for the once dominant Italian people. In the aftermath of an Etruscan defeat there were immediate consequences as to the city's relationship with Rome and its place as an Italian ally. Rome had no prescribed formula for how it dealt with a conquered Etruscan city. The outcome was particularized according to the initial cause for war, the past relations with that city, and the result of the actual military engagement.

Among all the pacified Etruscan cities, the incorporation of Veii in 396 BCE was most significant to the rise of Rome. The expansion of Rome by the additions of Veii can be measured by numerous means. Roman territory more than doubled in size with the addition of Veian lands and the auctioning of the population was Rome's first attempt at large-scale enslavement.

Rome's interactions with the Etruscans did not cease once they were conquered. An interest in Etruscan culture and identity persisted in Roman society centuries after the conflicts were fought and the cities subdued. A uniquely Etruscan culture continued to thrive in central Italy in spite of the loss of political autonomy. Etruria benefited overall from the stability offered by Rome. Much of the famous Etruscan art known today, including sculptures and tomb paintings, was produced from the fourth century BCE and onward into Roman times. Though Etruscan culture never fully vanished in the Roman period, its language did disappear from use. Etruscan eventually succumbed to Latin sometime near the end of the Republic; bilingual tomb inscriptions in both Latin and Etruscan are used to track the decline of the Etruscan language.

Eugenius (Usurper) (d. 394 CE)

Flavius Eugenius was a usurper who ruled the western half of the Roman Empire from August 22, 392 to September 6, 394 CE. His reign is often thought to represent the last significant pagan challenge to the dominance of Christianity in the Roman Empire. Reconstructing the detail of Eugenius' reign is difficult due to a paucity of ancient sources for the period. With the history of Ammianus ending with the year 378 we are forced to rely on brief epitomes, the history of Zosimus and the work of church historians. Both Zosimus and the church writers are highly biased regarding Eugenius' usurpation and must be used with care.

Eugenius came to power in 392 after Valentinian II, who had been given responsibility for the west by his brother-in-law the eastern emperor Theodosius I, was either murdered or driven to suicide by his Frankish *magister militum* Arbogast. Knowing he would not be accepted as co-Augustus by Theodosius, Arbogast instead raised Eugenius to power (Zosimus 4.54.2; Socrates 5.25). Prior to his accession Eugenius was a teacher of rhetoric who had also served as chief secretary to Valentinian II. Needing support among the western aristocracy, Eugenius appointed leading pagan senators to senior positions in his regime. Despite the claims of Christian writers, there was no widespread pagan revival under Eugenius. Instead Eugenius (himself a Christian) offered pagan senators support as they

publicly patronized pagan causes, a decision which brought him into conflict with Ambrose of Milan (Ambrose, *Letters* 57).

Eugenius was Augustus in name only and was most likely directed by Arbogast in all his actions. Initially Eugenius attempted to coexist with Theodosius. He sent emissaries seeking approval for his appointment and minted coinage in the names of both Theodosius and his son Arcadius. Although Theodosius did not immediately denounce the usurper, he quickly began to prepare for war (Zosimus 4.55, 57). In January 393, Theodosius raised his second son Honorius to the rank of Augustus, signaling his intent to keep the empire in his dynasty's hands. In mid-394, Theodosius finally moved west with a large army, defeating Arbogast and Eugenius at the Battle of the Frigidus River on September 5 and 6, 394. Following Theodosius' victory, Eugenius was captured and executed (Zosimus 4. 58.2–5; Sozomenus 6.24).

Euphrates (River)

The Euphrates River is one of the two great rivers of Mesopotamia, west of the River Tigris, and in Roman times was sometimes a frontier of the Roman Empire in the east. The Euphrates originates in the mountains of Armenia and first flows in a southwest direction toward the Taurus Mountains before it flows southward.

The Euphrates formed an unofficial boundary between the Roman and Persian Empires. Individual Roman emperors sought to extend the area of Roman control eastward to the Tigris River, establishing client kingdoms in

Mesopotamia as buffer states between the Roman and Persian Empires. Septimius Severus established Mesopotamia as a Roman province (197). The Persian Sassanid Empire, the Arsacids' successor, overran this territory and captured Dura-Europos, a Hellenistic city and Roman frontier outpost on the Euphrates, in 257 CE. Major Roman victories in 297–298 and a treaty of 299 extended Roman control eastward to the Tigris, but the region of the Euphrates and Tigris rivers was contested through the later empire, in a cold war of diplomacy that occasionally heated up into active warfare.

Eusebius (ca. 260–339 CE)

Eusebius of Caesarea, bishop of Caesarea, was a major early Christian historian, apologist, and scholar, writing in Greek. His *Church History* (finished ca. 324–325) broke new ground in presenting a history of the Roman Empire from a Christian point of view, and documents the persecutions of the early Christians. He included contemporary events, such as the so-called Great Persecution of 303–311 and the victory of Constantine the Great (306–337). Eusebius also innovates as a historian by quoting documentary sources in full, a practice usually avoided by classical authors who prefer to summarize or paraphrase such documents. The *Church History* thus is a valuable source of documents pertaining to the early Church and the persecutions. Eusebius sees pagan-Christian conflict as a major historical force, in contrast with non-Christian authors who probably viewed the persecutions of Christians as incidental (probably as a matter of public order).

Eusebius also wrote an encomiastic biography of Constantine, the *Vita Constantini*, and a lost *Chronicle* (replaced by Jerome's Latin *Chronicle*) that covered biblical and classical history from earliest times to the present. Eusebius thus is a useful source for the Tetrarchy and reign of Constantine.

Exile

Latin *exilium*, which in the imperial period employed the technical terms *deportatio* (deportation) and *relegatio* (relegation), was the most common capital penalty applied to Roman citizens during the Republic. During the Principate and later empire, exile applied to elite Roman citizens (i.e., senators and equestrians). The death penalty was not usually applied to citizens of the Republic or to elite citizens during the Principate.

During the Republic, citizens not on military service were protected from the arbitrary judgment of magistrates by the right of *provocatio ad populum*, appeal to the Roman people. They could request a fair trial. In exemplary narratives from the early Republic, *provocatio* saved citizens from the death penalty. In practice, during the Classical Republic, exile was the most severe penalty applied to citizens. Those exiled beyond the boundaries of Roman territory might take refuge in the Greek Eastern Mediterranean, hardly a severe punishment. Nonetheless the exile suffered *aquae et ignis interdictio* (interdiction from fire and water, i.e., no citizens or allies might lend him or her aid). He or she may have lost Roman citizenship, though this is debated by scholars.

The civil wars and civil conflicts of the late Republic caused the death penalty to be applied to citizens who threatened the public safety or committed treason. In some cases, the death penalty was extrajudicial, a result of the *senatus consultum ultimum* (SCU) that empowered the consuls or other executive magistrates to “see to it that the state suffered no harm,” authorizing them to inflict whatever violence they deemed necessary. In the late Republic’s civil wars and conflicts, those presently in power might

declare their opponents *hostes publici*, public enemies, liable to summary execution if caught. In the proscriptions of 82–81 and 43–42 BCE, the victims were *hostes publici*, exiled on pain of death and with a price on their heads; if caught, they could be summarily killed and their killers could claim rewards. A few of the victims escaped beyond the boundaries of the empire. However, outside of emergency situations such as these, the Republic still regarded exile as the most severe capital penalty.

The expansion of the empire decreased the geographic space available for exiles to flee to. Accordingly, in the Principate exile to islands became the favored mode of exile. Such exile could be relatively comfortable, or could be a severe hardship if the island in question was small, barren, uninhabited, and far from shipping routes. The Roman Mediterranean boasts hundreds of islands, from Sicily, Sardinia, and Corsica to tiny rocks; Britain was also counted. However, the symbolic nature of the islands as remote from society mattered more than their actual desolation.

Those exiled to islands underwent *deportatio*, the most severe form of exile, in which they lost their citizenship and civil rights; their property was confiscated, and their familial relationships were dissolved. A less severe form of exile was *relegatio* (relegation), in which the convicted person did not lose his or her civil rights but might suffer loss of property. A relegated person might undergo temporary exile or be forbidden to enter the city of Rome or other defined areas of the empire, but was not necessarily restricted to an island. Female adulterers and their lovers were exiled to different islands.

In the imperial age, deportation and relegation applied to the upper orders, who normally were not executed. The exception was execution for sedition or treason; even in these cases, aristocrats might be offered the opportunity to commit suicide, sparing them the humiliation of execution. In contrast, members of the lower orders, even if Roman citizens, were subject to the death penalty and, increasingly, to exacerbated death penalties (such as being thrown to wild beasts in the arena) formerly reserved for slaves.

Extraordinary Levies

In emergencies, the Romans recruited groups or classes of persons who were normally ineligible for service in the legions, including *capite censi* (in the pre-Marian Republic), and slaves and freedmen. Such recruitment is distinct from the *tumultus* (*levée en masse*, call-up of all male citizens of military age) that marked a state of emergency.

The traditional Republic's military recruitment excluded men without property, termed *proletarii* or *capite censi*. In 280 BCE, *capite censi* were called up to campaign against Tarentum in South Italy. Marius made it routine to recruit *capite censi* into the legions, and the barrier to service thenceforth was slave status. Slaves and freedmen traditionally did not serve in the legions. They might be recruited into Rome's navy, as occurred in 217, 214, 181, and 171 BCE (Livy 24.11.7–9, 22.11.8, 40.18.7, 42.27.3). After the battle of Cannae (216 BCE), due to the mass casualties, the Senate authorized the recruitment of freedmen (Livy 22.57.12, 23.35.7). The loyalties of many of these freedmen was to their former master Tiberius Sempronius Gracchus (an ancestor of the tribune of the plebs), according to Livy (25.20.4).

After the Pannonian revolt in 6 CE and the Varian disaster of 9 CE in which three legions were lost, Augustus authorized the recruitment of freedmen. The owners of suitable slaves were required to free them (described in Velleius 2.111). The measure is alluded to in Tacitus, *Annals* 1.8 and 1.16. These units of freedmen were organized as cohorts, not legions,

and termed *cohortes voluntariorum civium Romanorum*, “cohorts of Roman citizen volunteers” distinguishing them from regular auxiliary cohorts of noncitizen soldiers. The freedmen cohort soldiers received a donative as Augustus’ bequest, as did other Roman citizen troops (Tacitus, *Annals* 1.8). The *cohortes voluntariorum* are also attested in inscriptions. Freeborn civilian volunteers, the *cohortes ingenuorum*, were also recruited for the emergency (*ingenus* means freeborn).

Under normal conditions, slaves were not enlisted and were not permitted to enter the army. As governor of Bithynia, Pliny the Younger wrote to Trajan about the disposal of two recruits who had proven to be runaway slaves; Trajan reiterated the rule that slaves were prohibited to enter the army (Pliny, *Letters* 10.29–30). The only division of the army routinely open to freedmen was the *vigiles*, Rome’s fire brigade.

If there was a sudden need for manpower, it was also possible to promote soldiers from one branch of the service into another. During the civil wars of 68–69 CE, fleet soldiers were recruited *en masse* to make up two legions, Legio I Adiutrix and II Adiutrix (“Helper”), which then sought permanent status (Tacitus, *Histories* 1.6, 3.55; Suetonius, *Galba* 12; Dio 55.24.2). In 193, Septimius Severus sacked the praetorians who had supported Pertinax’ assassination and replaced them with men promoted from the Danubian legions.

F

Fabius Maximus (275–203 BCE)

Quintus Fabius Maximus Cunctator was a Republican Roman statesman and war hero mostly remembered for the delaying tactics he employed against Hannibal during the Second Punic War. Though Fabius was an established general and politician by the time of Hannibal's invasion, the Second Punic War thrust him into a commanding and controversial role as dictator.

Fabius was born into one of the Republic's oldest patrician families, the Fabii, and was known for upholding traditional Roman values. His long career consisted of five consulships (233, 228, 215, 214, and 209 BCE) and the dictatorship; he was also chief augur and *pontifex maximus*, and he celebrated two triumphs. Fabius had at least one son, Quintus, who became consul in 213 BCE.

Fabius' traditionalist reputation and influence brought him into conflict with other Punic War era Roman heroes such as Marcus Claudius Marcellus and Scipio Africanus who espoused more aggressive policies. The rivalry between Fabius and Marcellus was well known; they had opposing personalities and used every bit of influence at their disposal to compete for political, martial, and religious honors. Fabius also resented Scipio's nontraditional rise to fame and did what he could to counter the young man's aggressive plans.

Fabius' long career climaxed when he became dictator in 217 BCE, directly following the Romans' defeat at the battle of Lake Trasimene. Though known for his conventional ways, Fabius as dictator was anything but conventional. Acknowledging that the Romans could not defeat Hannibal and his cunning tactics in battle, Fabius avoided pitched battles

and from high ground continually harassed Hannibal's foraging troops. This method of warfare would eventually weaken the Carthaginians by keeping them constantly vigilant and depriving them of food. These tactics became known as "Fabian tactics" or "delaying tactics" and earned the dictator the nickname Cunctator, "the Delayer." Though Fabius—and Hannibal—understood the power behind this plan, its evasive nature was antithetical to the bellicosity traditionally inherent in Roman warfare.

Consequently, Fabius' troops and his second in command, Minucius Rufus, criticized him for "cowardice." Fabius' lack of a definitive victory also attracted negative attention at Rome and Minucius was elevated to the unprecedented status of codictator in the hopes that he could defeat Hannibal since Fabius could not. It was not until Fabius rescued Minucius from one of Hannibal's ambushes that Minucius realized that he had wrongly judged the senior dictator and resigned his office. While Fabius' tactics remained contrary to Roman warfare, they nevertheless were employed again after the battle of Cannae (216 BCE) when the Romans at last understood that facing Hannibal in pitched battles was not feasible at that time.

Fabius' reputation was unaffected by his dictatorship; though nearly 70 years old, he continued to be an active and influential member of the Senate and went on to win a triumph for his sack of the Greek city of Tarentum in southern Italy. Sadly, he did not live long enough to see the conclusion of the war and died of natural causes in 203 BCE just as Scipio Africanus was moving toward Carthage. Fabius was affectionately remembered as the "Shield of Rome." Cicero once said of Fabius, "Though quite old, he waged war like a young man."

Fabius Valens (d. 69 CE)

Fabius Valens was a legionary commander in Lower Germany at the time of Vitellius' revolt in 69 CE, and may have encouraged it. After the troops in Germany refused to take oath to Galba, Valens led his troops in proclaiming Vitellius as emperor. Vitellius split his army into two forces, with one headed by Aulus Caecina Alienus, and the other commanded by Valens; Caecina and Valens advanced through Gaul and into north Italy. Their combined force defeated the army of Otho at the First Battle of Bedriacum (April 14, 69). When the army supporting Vespasian reached Italy, Valens fell ill, leaving command of the Vitellian forces to Caecina. After the Vitellian army lost at the Second Battle of Bedriacum, Valens fled Italy, only to be captured and beheaded.

Factions

Factions (sg. *factio*, pl. *factiones*) were groups or alliances in the politics of the Roman Republic. They might coalesce around a particular politician or family, connected by bonds of kinship and friendship (*amicitia*); members might be connected by mutual obligation or patronage. The Scipionic faction in the late third and early second centuries BCE is an example of a faction centered around a powerful family. These factions were personal in nature rather than ideologically oriented.

Other factions were broader and reflect common material interests. The optimates or “best men” of the late Republic identified with the Roman aristocracy and often were nobles, wealthy landowners, and businessmen.

Optimates favored the Senate and disapproved of more populist institutions such as the tribunate of the plebs. The *populares* or “people’s politicians” appealed to the *plebs*, in particular the urban populace. Tribunes of the plebs were by tradition *populares*. However, a wealthy aristocrat might be a *popularis*, exploiting his appeal to the public. The optimates and populares were not political parties or class identities in the modern sense; they had a disposition to support policy and vote a certain way in the assemblies and the Senate, but no formal ideologies or codified platforms. The impact of such factions still depended on personal influence and alliances. Thus interpreting republican political relations as “factional” has often been a matter of controversy.

Individual popular leaders encouraged popular followers who could become a source of mob violence in the late Republic. The most notorious such leader was Publius Clodius Pulcher, tribune of the plebs, who encouraged his followers to tear down Cicero’s house; the followers of Titus Annius Milo later lynched Clodius (52 BCE).

“Faction” itself became a term of abuse. A politician might describe his opponent’s party as a faction but would not do so for his own supporters. Thus Augustus, in his autobiographical *Res Gestae*, famously stated that “I liberated the state from the domination of a faction” (*rem publicam a dominatione factionis oppressam in libertatem vindicavi*, RGDA 1), alluding to his opponents, Caesar’s assassins.

Faction in republican politics is distinct from the “circus factions” best known at Constantinople in late antiquity, but found in many large cities. These were the fans of chariot racing teams, for example, the Blues and the Greens at Constantinople. They were prone to rioting.

Fall of the Roman Empire (West), Causes

Both internal weaknesses and external pressures came to a head in this rolling series of problems and disasters. The external factor is the most dramatic and obvious: the Germanic and Hunnic invasions. It is difficult to claim that the external threat was much more formidable than in earlier periods, although a case can be made that the invaders were more numerous. The fall of the western empire is thus not a story of major battles and defeats, but rather of inability to keep enemies out and to recover territory lost. The loss of Africa, its grain supply and revenues, was most damaging; laws from the 440s indicate a desperate financial situation. The empire's forces seemed unable both to maintain a solid extended frontier and to preserve internal political unity; as in the third-century crisis, an internal crisis, such as civil war or a coup, invited external invasion and vice versa. Despite Rome's long history of incorporating outsiders, the fifth-century empire did not effectively control or co-opt new and potential barbarian clients. The problem may have been one of scale as much as opinion (e.g., prejudices against barbarians and Arians). Furthermore, too many of the new groups had forced their way in, being neither defeated nor received as suppliants. Rome was no longer in a position to always dictate terms, and allied tribal groups kept their own leaders and hierarchy. Barbarian incursion and settlement caused a vicious cycle: each province lost meant a diminished capacity to recover and to withstand future invasions.

Not all barbarian movement into the empire was hostile, and recent scholarship has tended to downplay the scale and effects of the barbarian migrations. One of the important things barbarian settlement did was to expose already-existing fault lines beneath the imperial surface. The willingness of the Gallo-Roman aristocracy to accommodate Visigothic kings, for example, suggests a growing gap between the imperial center and regional aristocracies. Weaknesses at the center meant the provinces increasingly looked to self-help or accommodation.

The major weakness at the center was one of leadership. Ineffectual

rulers were dominated by powerful generals, often of barbarian stock, from Stilicho to Gundobad, and it is notable that powerful warlords often chose to rule from behind the throne. The public role of the emperor had become extremely formal and ceremonial, and while this had not hindered powerful third- and fourth-century emperors (e.g., Diocletian, Constantine I, Valentinian I, Theodosius I), it seems to have stultified less dominating personalities. These weak emperors, furthermore, tended to provoke usurpers, and emperors had a marked tendency to confront rivals rather than external enemies. Attention and resources devoted to civil wars further hampered Roman recovery from existing problems.

Economic and social factors also had a role. The western empire was generally less prosperous than the eastern empire, but archaeological studies suggest no universal economic decline, and some regions, like Africa, flourished. Vast amounts of land were concentrated into huge and far-flung aristocratic estates owned by a very few families and farmed increasingly by *coloni*, tenant farmers tied to the land. Other land is described as abandoned. These patterns of land tenure are hard to verify, as is demographic change in a period without available population statistics. Nonetheless, disruption of resources and manpower may have contributed to the collapse of the western empire. There were difficulties in large-scale military recruitment from the provinces, and landlords preferred to provide coin rather than conscripts. This increased Roman reliance on allied barbarian troops (*foederati*), effectively mercenary bands setting their own price.

We may connect this to the tendency of Rome's elites, other than the emperors themselves, not to participate in warfare. After Constantine, senatorial status was an *honor* deriving from high-ranking service in civilian government posts. As such, the military officer cadre was socially distinct from the civilian elite, further fragmenting the unity of the empire.

We must also recognize the long-term survival of the eastern empire, which shared many of the western empire's weaknesses. Two major distinctions are the much lower occurrence of armed invaders in the eastern empire, before the Arab conquest, and a civilian-dominated government that resisted the takeover of power by supreme generals. The eastern empire was also significantly richer; indeed, part of the weakness of the western empire lay in the division into two empires: the western regime could not draw on the resources of the eastern Mediterranean to make up its

shortfalls.

Fall of the Roman Empire (West), Course

The fall of the western Roman Empire was not a single moment in 476 CE, but rather a process of slow erosion of imperial control. The fourth-century rejuvenation of the Roman Empire faltered early in the fifth. The empire was divided in 395 between the young sons of Theodosius I (379–395), Arcadius (395–408), and Honorius (395–423), who both became weak rulers controlled by powerful advisors. In the western empire, the power behind the throne until 408 was Stilicho, the first in a series of commanders, often of Germanic origin, usually holding the ranks of *magister utriusque militiae* (commander-in-chief) and patrician, effectively governing the western empire through ineffectual emperors. Much of Honorius' reign was characterized by military crises involving Germanic incursions and rival usurpers. A Gothic invasion of Italy in 402 led the court to move from Milan to the more defensible Ravenna, which remained the capital until the end of

the western empire. Stilicho's regime managed several emergencies, but not the wandering army of Alaric's Visigoths, and in 408 rival factions at court convinced Honorius to execute Stilicho. This left Honorius to deal with Alaric, a task to which he was unequal. His inability to choose conciliation or resistance led finally to the sack of Rome in 410.

Numerous enemies took advantage of the power vacuum generated by the weak, indecisive emperor. At the end of 406, bands of Vandals, Alans, Suebi, and Burgundians crossed the frozen Rhine and campaigned through Gaul for three years. Revolts and usurpers were frequent. In Britain, several arose in succession; the most successful, Constantine III (407–411) established himself in Gaul in 407, helping to secure the region. The year 409 saw usurpers in Spain, Gaul, and even Rome: Priscus Attalus (409–410; 414–415), a compromise candidate between Alaric and the Senate. Britain was formally abandoned (ca. 410), while the Vandals, Alans, and Suebi overran Spain and divided it between themselves.

The shock of Rome's sacking was much greater than its material or military effects. Recovery was possible into the 420s, thanks partly to Constantius III (421), briefly co-emperor with Honorius after having served him as a highly successful general, who established alliance with the Visigoths in 418, at the cost of Aquitaine.

The deaths of Constantius III in 421 and Honorius in 423 left a power vacuum, briefly occupied by Johannes (423–425), but Galla Placidia, Honorius' half-sister and Constantius' widow, persuaded the eastern emperor Theodosius II (408–450) to reassert dynastic and imperial unity by placing her son Valentinian III (425–455) on the throne. Galla Placidia ruled as regent for Valentinian until 437, balancing the competing great generals Aetius, Boniface, and Felix.

Aetius was successful in reasserting Roman control in the north. Preferring to be sole commander-in-chief, Aetius eliminated his rivals in the early 430s, and wrested control from Galla Placidia, but did not attempt to become emperor. Aetius' regime was strong, and achieved stability through force, diplomacy, and gold subsidies paid to the tribes. Barbarian settlement within the empire nonetheless expanded. In 429, the Vandals left Spain to conquer North Africa, severing much of the richest part of the western empire and disrupting maritime trade. Aetius assembled an invasion force in 440 in response to the capture of Carthage, but abandoned the plan due to the Hunnish threat. A treaty recognised the Vandal king Geiseric as

essentially independent in 442.

The great invasion force of Attila the Hun was met and defeated by Aetius and his Visigothic allies near Châlons in 451. Attila himself died after an abortive Italian campaign, dissolving the Hunnish empire. Aetius' power seemed assured, but Valentinian III, wanting to rule in his own right, personally killed him in 454. Valentinian was assassinated the next year, and Petronius Maximus acclaimed (455). Rome was that year sacked again, much more brutally, by a Vandal raiding force; Petronius Maximus was assassinated.

Subsequent emperors faced expanding barbarian kingdoms in Africa, Spain, and Gaul. Avitus (455–456) was next acclaimed by the Visigothic king Theoderic and the Gallo-Roman aristocracy. On a visit to Rome, the Italian army revolted under Majorian and Ricimer, who deposed Avitus and forced him into clerical orders. Ricimer, as *magister utriusque militiae*, put Majorian (457–461) in power, beginning Ricimer's 15-year tenure as kingmaker in the western empire. Majorian was one of the last emperors to attempt imperial recovery, against the trend of central power devolving into separate kingdoms. He recaptured parts of Gaul, and campaigned through Spain, but failed to invade Africa because of problems with his fleet. On return to Italy, Majorian was killed by Ricimer, who after a few months raised Libius Severus (461–465) to power. Geiseric had suggested Olybrius, who would be emperor briefly in 472. Notably, these nominees were all Romans, not Germans. In the meantime, the eastern emperor Leo (457–474) and Ricimer agreed to invest the eastern aristocrat Anthemius (467–472) as western emperor, with full eastern backing to launch a campaign to retake Africa. It was not to be. After initial success, treachery and adverse winds allowed the Vandals to destroy the Roman fleet, ending hopes of western recovery. Gaul too was abandoned. Ricimer declared war on Anthemius, and both, along with Olybrius, died in 472.

The Burgundian prince Gundobad installed Glycerius (473–474), but gave up on *de facto* control of the empire in favor of ruling his own small kingdom, a very telling decision. In 474, Julius Nepos (474–480) was raised by the Illyrian army, with Leo's blessing, to replace Glycerius. In 475, Nepos was ousted by the patrician Orestes, and left for Illyricum, where he ruled until 480. Orestes installed his aptly-named son Romulus (Augustulus, 475–476). In 476, Odoacer, a Scirian commander, removed the boy from office, sent the imperial insignia to Constantinople, and began to rule in Italy as

patrician and king.

Fall of the Roman Empire (West), Consequences

The end of the western empire gradually led to the dawn of medieval Europe. However, the year 476 is no longer seen as a sharp cataclysmic division between ancient and medieval, but rather a time of transformation; late antiquity was a vibrant and innovative period in its own right.

Nonetheless, the late fifth century did see the end of an era and of an empire, and in particular, the end of any attempt to maintain an imperial regime in the west as an overarching structure. Centralization disappeared, both in administration and culture, enabling the new barbarian kingdoms to coexist within the old imperial borders: Vandal Africa, Visigothic Spain and Aquitaine, Frankish and Burgundian Gaul, and Ostrogothic Italy all became more or less stable, if not peaceful, kingdoms. Common Roman culture eroded at different rates in different regions: rapidly in Britain, whereas Ostrogothic Italy remained fundamentally Latin.

Despite archaeological continuity between fifth century and post-Roman cultures, economic consequences are clear. Sophistication and quality of

ordinary artifacts drops, particularly in the pottery record. The empire had made large amounts of high-quality goods available to the average provincial, and had provided a coherent, safe network of long-range trade. While trade continued, imperial infrastructure and easy communication and transport over long distances disappeared. The empire-wide culture of traveling noblewomen and landowners with far-flung properties likewise dissolved. The post-Roman west had narrower horizons. The scale of building, even for new churches, was much reduced, and cities shrank—across post-Roman western Europe is seen a strong trend toward increased civic fortification, but very often on smaller footprints. Land surveys also indicate fewer rural sites in the fifth to seventh centuries. These all points to a shrinking economy and population.

The normative elite literacy and highly educated culture of the empire did not endure in the west; it was retained in Constantinople, but there lost its Latin character, preserving Greek classicism. By around 600, Latin literacy was mostly confined to clergy. This meant that the intellectual world became solidly clerical; knowledge of the pagan Roman past dimmed.

The most notable beneficiary of the end of the empire was the Church. The power vacuum left behind by imperial administration meant that bishops, already major power brokers in many cities, were representatives of the only surviving interregional body, tied together and to the emerging papacy in Rome. The head of such a system could only gain in prestige and authority. A number of formerly imperial roles were adopted by the popes, and the emergence of a strong papacy seems inconceivable without the Empire's collapse.

An additional consequence was the persistence of the enduring ideal of Rome, and the desire of some ambitious individuals to recapture it. Just over 50 years after Romulus Augustulus, Justinian (527–565) launched his campaign to retake the western empire, ideologically charged but fundamentally doomed. The Byzantines nonetheless persisted in calling themselves Romans (*Rhomaioi*), and the concept of the western empire would overshadow Europe, with Charlemagne's attempt to revive the Roman Empire in 800 CE.

Fall of the Roman Republic

The causes of the collapse of the late Republic lay in the new extremes of wealth among the elite and the breakdown of cohesion and cooperation within that elite starting with the Gracchan conflicts in 133 and 123–121 BCE. Vast military successes in the second century BCE had brought Rome political and economic control over huge territories throughout the Mediterranean and thus wealth in the form of indemnities, tribute, taxation, and spoils, as witnessed by displays such as the Pydna triumph of Aemilius Paullus in 168 (Plutarch, *Aemilius Paullus* 32–35). The cultural emphasis the older Roman elite placed on fair competition for offices and honors had been useful when harnessed to public service; however, when the possession of resources and power among the elite became extremely uneven, this sense of competition became harmful to the principle of fair cooperation. This change dampened leveling impulses among Roman elites and instead fostered the taste for conspicuous consumption noticed and decried by the likes of Cato the Censor (Plutarch, *Cato Maior*). Offices and war brought wealth and glory, and competition for these goods became more extreme throughout the late Republic, with glory-seeking individuals setting precedents alien to republican norms.

Three major ingredients of future civil conflict began in the late second century BCE. In 133, Tiberius Gracchus' forcing of a land-reform bill brought

about his assassination. Tiberius' refusal to follow elite power-sharing norms created an example, as did his lynching. Such events repeated at intervals for the remainder of the Republic. Gaius Marius' removal of property requirements for legionary service in 107 BCE, intended to give work and money to landless men targeted in the Gracchan reforms, instead paradoxically contributed to civil conflict. It created armies of landless individuals, their weapons now supplied to them, their loyalty attached to their general in a personal patron-client relationship rather than to the Roman state as a superpersonal entity.

Political competition between Marius and Sulla became deadly, setting another pattern for the century. Rivalry between Marius and Sulla erupted into civil war in 88 and 82, resulting in Sulla's march on Rome, proscriptions, and conservative reforms. Loyal to Sulla were both his armies and the equestrians he promoted to the Senate, providing more precedents for future dynasts. However, Sulla's increase in magistracies created more competitors for office, hence harsher competition to reach higher offices. Moreover, the civil war normalized massacre, such as the Sulla's slaying of the Samnites as a warning to the Senate.

After Sulla's abdication, legal channels for ambition now seemed constricted or breakable in the era of the dominance of Pompey and Crassus. Pompey was too young to receive proconsular *imperium* necessary to campaign against Sertorius' Spanish empire in 77, but exceptions were made in his case (Plutarch, *Pompey*). This set new patterns for breaking republican rules. After defeating Sertorius, Pompey took over the Roman offensive in the Third Mithridatic War from Lucullus, winning the war effectively. Spartacus' revolt of 73–71 BCE united landless poor citizens and slaves against Roman civil authority. Upon escaping from captivity, the Thracian slave Spartacus led an insurrection. Marcus Licinius Crassus' use of private funds to raise additional troops against this threat created another precedent for future dynasts. The display of Spartacus' army's corpses crucified on the Appian Way after the crushing of the revolt was a grotesque warning against would-be insurgents, but did not change the important fact that not only slaves but impoverished free persons had joined the revolt, signaling extreme civil discontent among the poor *plebs*. The elites were also destined for discontent: In 70 BCE, Pompey and Crassus marched to Rome and left their troops camped outside its gates. Both anticipated high honors and consulship. The Senate feared Pompey's troops,

but he was too young to be consul and had not held the prerequisite magistracies. Crassus and Pompey joined forces. The Senate permitted Pompey to run for office and he and Crassus won consulships for 70 BCE. After this year of cooperation, the two dynasts began rivalry again.

Some examples of civil conflict in the late Republic employed traditional channels, such as Cicero's prosecution of Verres for extortion in Sicily in 70 BCE. In addition, attempts to curb some abuses of power occurred in 67 under the tribunes Gaius Cornelius and Aulus Gabinus. They punished bribery and curbed the Senate's ability to grant exemption from laws. However, piracy had become intolerable in Mediterranean waters, prompting Gabinus to present voters with a bill to create a command against piracy with consular rank, immense resources, ships, and staff for three years. Most senators opposed this bill, fearing it would empower one individual dangerously, but the Roman populace made the bill pass. The command went to Pompey. His clearing the seas of piracy demonstrated the effectiveness of an individual given sufficient power, and led to his success in the Third Mithridatic War and to further campaigns in the eastern Mediterranean, creating a loyal army of followers for himself and Rome. His splendid triumph in 61 raised the stakes for other Roman elites' pursuit of glory.

Elite competition for office required increasing displays of power such as public festivals, games, and monuments, leading naturally to debt. Lucius Sergius Catilina exploited this, running for consul for 63 on a platform of debt cancellation, and again for 62 using more extreme rhetoric, attracting debtors both from both elite and the masses, including Sullans, farmers, and victims of Sulla's proscriptions (Cicero, *Against Catiline*; Sallust, *Bellum Catilinae*). Winning neither election, Catiline resorted to planning revolution. Allying with him, the former centurion Gaius Manlius began forming an army of impoverished peasants and former Sullans to march on Rome. Cicero arrested and executed the conspirators. Although the Senate disdained Cicero, he believed that maintaining the Senate's prestige was essential to the Republic's survival and concord between the orders, a concord all the more necessary in the face of Catiline's threat.

The penultimate years of the Republic matched Pompey and Julius Caesar against each other. In 62, Pompey returned from the eastern Mediterranean. Italy feared a new Sulla. He released his army before arriving at Rome, desiring recognition more than tyrannical power.

However, the Senate short-shrifted Pompey's great accomplishments, and in 60, refused Pompey's request for farmland for his veterans and ratification for his disposition of the eastern Mediterranean. Concord between Pompey and the optimates seemed hopeless. The younger Cato opposed both Pompey's wishes and a bill sponsored by Crassus to relieve *publicani* (tax farmers) who had bid too high. He moreover irritated the equestrians with another bill and frustrated Caesar by blocking his petition to run for consul *in absentia*. Then for 59 BCE, he offered Caesar as consular provinces Italy's cattle-tracks and forests, a trivial appointment that Caesar obviously did not want. This antagonism aggravated elite civil conflict, thwarting Pompey, Crassus, and Caesar to the point that they formed an alliance (the so-called First Triumvirate) to pursue their goals. The First Triumvirate granted Caesar his desire, the proconsulship of Gaul and scope to conquer Gaul.

Caesar's successes in Gaul in the 50s BCE spurred resentment in the Senate, which blocked his policies. In 49, Pompey and the Senate declared Caesar a public enemy. Invading Italy, Caesar defeated Pompey at Pharsalus in Thessaly. After Pompey fled to Egypt and was assassinated there, the Senate, pressed, made Caesar dictator (in 44 for life), consul, and *pontifex maximus*. Caesar's reforms were intended to reduce conflict, including a rationalization of government in Italy and the provinces. However, all this was too much for the Senate. His assassins in 44 called him a tyrant.

The Republic's final years saw more civil war following Sulla's template. Caesar's will, snubbing Mark Antony, declared as his primary heir Octavian, who exploited Caesar's memory to his advantage. The Senate's disinclination to give Octavian a triumph or reward his troops led Octavian to march on Rome, a Sullan tactic. Though he was too young for the office, Octavian received a suffect consulship in 43 at age 19, and created with Antony and Lepidus a "three-man board for the restoration of the Republic" the so-called Second Triumvirate, which seized most consular powers and in Sullan style effected proscriptions and packed the Senate with clients. In 42, the triumvirs defeated Caesar's assassins and then made an uneasy peace with different spheres of influence. Civil war resumed in 32: Octavian presented it as a war of Rome against Egypt, where Antony was living with Cleopatra VII. Octavian won, becoming sole ruler of the entire Mediterranean. Civil conflict was transformed by the poet Horace's pen into Rome's victory over Egypt's raving queen.

The ultimate fruit of the breakdown of the Roman Republic was

acceptance among both elites and nonelites of a new form of monarchy in the person of Octavian. His reception of the title Augustus in 27 BCE normally marks the year that ended the Republic and began the empire. The terrors of civil war made his subjects inclined to accept any alternative, even one offending republican power-sharing sensibilities. Augustus enacted many reforms but did not become dictator, and retained the Senate and the offices of the Republic: his control of government was subtler. In any case, his reign ended a period of severe civil conflict, “winning over the soldiers with gifts, the populace with cheap grain, and all men with the attractions of peace” (Tacitus, *Annals* 1.2).

Families of Imperial Soldiers

Legionary and auxiliary soldiers in the Roman army were not legally allowed to marry during their period of military service for at least the first

two centuries of the Principate (ca. 13 BCE–197 CE and possibly longer). At the same time soldiers formed *de facto* relationships that were not technically legal but occurred frequently, with the result of offspring that until 140 CE were legalized with the right of citizenship conferred by the Roman government when the soldier retired (recorded in Roman military diplomas). High level officers, such as the prefect of an auxiliary unit (cohort or *ala*) and probably also the centurions, were allowed legal marriage and their families often lived within the fort itself. The *praetorium* (residence of the commanding officer) was located in the central area of an auxiliary fort and the centurions' quarters were located in a larger unit at the end of standard barrack blocks. Most likely the families of the rank and file lived outside the fort itself in the extramural settlements that adjoin most military sites. Some evidence suggests that families of soldiers may have traveled with the unit either on campaign or when changing locations (e.g., Cassius Dio 56.20.2), but it is unclear whether this practice was typical. Equally uncertain is the location of soldiers' families during volatile periods or while the unit was on active campaign. It is doubtful that dependents of soldiers accompanied the unit on active campaigns, and we should expect that the extramural settlements remained occupied during times of conflict to house soldiers' families and other noncombatants associated with the unit.

Federates

Federates (Latin *foederatus*, plural *foederati*), also translated "allies," were non-Roman communities who had entered into a *foedus*, a treaty or perpetual agreement, to provide military service to Rome for land or other considerations from the Roman government. The practice is best known and most debated in the later empire (from the 380s onward). The debate over the *foederati* in the later Roman army concerns their novelty, their extent and their alleged "barbarization" of the Roman army. It is colored by the increasingly opportunistic behavior of some of the allied Germanic peoples and their leaders, such as Alaric, king of the Visigoths.

There was nothing new about the empire's use of non-Roman contingents to flesh out Roman armies. As early as the Polybian legion non-Roman manpower, as the Italian allies, seems to have provided up to half the strength of Roman armies. Client monarchs also supplied contingents to Roman wars. The imperial *auxilia* were originally recruited from non-Roman peoples, as were the *numeri*, smaller fighting units that maintained native weapons skills such as archery and slingshots. Many units of the late third-century Roman army took their titles from the native peoples they were originally recruited from. The titles persisted, though the regiments were probably filled with local recruits and lost their ethnic character. These units are not considered federates.

The increased use of federates is usually attributed to Theodosius I (379–395) in a treaty that he concluded with the Goths in 382, obliging them to fight for Rome. Theodosius faced a manpower problem due to massive Roman losses in the battle of Adrianople (378). However, his action should

not be regarded as unprecedented (above) or desperate. From the Roman perspective using non-Roman manpower in Roman armies was pragmatic. First, fewer Roman citizens had to be inducted every year. The evidence suggests that, during the fourth- and fifth-centuries Rome was having increasing difficulty recruiting citizens to serve in the army, and was having difficulties paying those Roman citizens who were serving. *Foederati*, on the other hand, were usually recruited from large groups, even whole peoples, who were willing to serve in the Roman army in exchange for land to settle on. Their equipment and training were up to their leaders, whom the Roman authorities paid. Many of the federate peoples were so-called warlike peoples, a major component of the Germanic “barbarian” stereotype, and did not need special training.

Barbarians might assume the status of *foederati* in several ways. The most common was by treaty or arrangement with a barbarian community outside the empire, committing warrior bands to Roman service. The Huns were particularly known for this method of service, as Hunnic auxiliaries served under Aetius in support of the usurper Johannes (423–425) and later in Gaul. Barbarians also came to be *foederati* by being admitted into the empire. In this case whole communities rather than just warriors were involved, and they were usually given land in exchange for military service. Such communities could be disruptive, however, and sometimes became military threats. For example, the Burgundians were initially allowed into the empire as *foederati* in the 420s, but later began raiding Roman territory and were attacked and decimated by the Huns, at the direction of Aetius, in the 430s. A third way barbarians became *foederati* was through the collapse of barbarian kingdoms, in which case some splinter groups were taken into Roman service. The advantages from the Roman perspective were surely securing fighting men for the Roman army and keeping those same splinter groups from raiding Roman territory.

This raises two inter-related questions: to what extent did the use of *foederati* lead to the “barbarization” of the Roman army, and to what extent were *foederati* loyal to Rome? As for the question of “barbarization,” the evidence seems to indicate that *foederati* as a percentage of the Roman army remained relatively steady throughout the third and fourth centuries. Furthermore, *foederati* units, as they suffered losses and retirement, were supplemented with whatever recruits the Romans could find, meaning that ethnic units would, over the course of a generation, lose their ethnic

character. Finally, the evidence is that *foederati* were, generally speaking, loyal to Rome. *Foederati* units did support usurpers, but then so did Roman regiments. As long as Rome was providing pay and land, there was no incentive for *foederati* to conspire against Roman rule.

The Franks provide a good case study. The Franks became *foederati* in 358 after being defeated by the emperor Julian (361–363), who had crossed the Rhine and invaded Frankish territory. Entering into a *foedus* with Julian, the Salian Franks were allowed to migrate west of the Rhine, taking over territory that was underpopulated, in return for military support. The Salian Franks provided a bulwark against other peoples east of the Rhine, while simultaneously bringing into cultivation land that had apparently been abandoned by Roman farmers.

The example of the Gothic migration of 376 offers an example of a *foedus* that failed. The Goths, fleeing the depredations of Huns who were themselves migrating from Central Asia, arrived on the Danube and requested the emperor Valens (364–378) grant them the status of *foederati*. Under this arrangement, the Goths were to provide military service in return for land to settle their families on. Valens saw an opportunity in this arrangement both to reinforce his army and to repopulate agricultural land that had been abandoned in previous decades. However, the Roman logistical system was unable to support such a large body of immigrants. Facing starvation, the Goths seized the supplies they needed from the surrounding territory. In response, the emperor Valens led the eastern Roman army out to attack the Goths, but was defeated at the battle of Adrianople. It was only a generation later, in 415, that the Goths were finally allowed to settle in Aquitaine.

Female Warriors

In discussing women as warriors, it is necessary to distinguish between women with influence in military affairs, women as commanders, and women as combat fighters. The political structure of the Roman Republic meant that women did not serve in the army or hold political office or military commands. Roman women of noble families might, however, exert indirect influence over political affairs. Fulvia, Mark Antony's wife before 40 BCE, wielded considerable political influence, supporting her husbands' dangerous political careers (she was married to Clodius and Curio before Antony). After Fulvia's death, Octavia, the sister of Octavian, helped to arrange the Treaty of Brundisium (40 BCE) between Octavian and Antony; she married Antony at this time, and later brought him troops for his Persian invasion. However, extrainstitutional political influence was distinct from office or military command.

In the civil conflicts of the late Republic, elite women faced danger alongside their husbands and a few women took up military command in special situations. In the *Laudatio Turiae*, an inscription from the late Republic, the husband of Turia commends her bravery in defending him when his life was threatened during the triumviral proscriptions. Other women helped their proscribed husbands escape to safety. It was not uncommon for women to take part in the defense of besieged cities. Fulvia and Antony's brother Lucius Antonius commanded the defense of the city of Perugia in north Italy when it was besieged by Octavian. Agrippina the Elder, wife of Germanicus, accompanied him on his mission to suppress the Rhine mutiny (14 CE) and played a leadership role in stemming a rout of Roman soldiers by greeting them at the Rhine bridge. Female leadership might be regarded hostilely; according to Tacitus, Tiberius resented Agrippina's action as a usurpation of power.

However, the sources most often depict female military leaders as non-Romans, such as Boudicca, queen of the Iceni and leader of the British revolt of 60/61 CE, or Zenobia of Palmyra. In such cases, ethnic difference and gender difference were conflated, making the female enemy leader doubly alien to Roman male eyes.

In these cases, it is probably correct to speak of female military commanders rather than fighters. Women warriors such as the Amazons or the Latin warrior woman Camilla appear in legend. Female gladiators

appeared in the arena. Despite these instances, and despite stories of small Roman (male) fighters defeating tall Gauls in single combat, in ancient warfare success in hand-to-hand combat depended greatly on height and physical strength, giving the average male greater advantage as a combatant when compared to the average female. This does not rule out exceptions (particularly tall, strong women from peoples with female leadership, who infiltrated the Roman army in disguise), though none are known. Women who infiltrated early modern armies found firearms to be an equalizing factor.

Courage (*virtus*, a quality pertaining to men, *virī*) was displayed by Roman women in other situations, such as resisting torture or committing politicized suicide, sometimes by violent means paralleling death in battle. Such courage was displayed by the legendary Lucretia and in historical times by Arria, wife of Caecina Paetus, a senator who was accused of conspiracy by Claudius (41–54). Arria set an example for her husband Paetus by stabbing herself first, telling him, “Paetus, it does not hurt” (Martial 1.13; Plin. *Ep.* 3.16). Courage was also displayed by female martyrs in the persecutions of the Christians.

Fetiales

The *fetiales* were 20 priests, who ritually ensured that Rome waged just wars and who monitored religious aspects of treaties. This priesthood, which was held for life, demonstrates the importance the Romans placed on ensuring divine approval in all military matters. Though fetial priests were an Italian custom, King Numa Pompilius (715–673 BCE) introduced fetiales into Rome. The priests acted as ambassadors to neighboring towns to

request redress for grievances before declaring war. The treaty ritual was still used in the 50s CE and the war declaration in the fourth century CE.

Fides

Fides, "loyalty," was an important Roman virtue with respect to military and political affairs. The communities which formally surrendered to Rome entered the *fides* of the Romans; granted protection, they owed submission and loyalty in return. The Romans thus could be extremely harsh toward subjects and allies who betrayed *fides* and defected or revolted. Such violators of *fides* were considered to deserve vengeance. A commander or governor who was cruel toward surrendered peoples or subjects also breached *fides*. However, such a commander or governor risked prosecution for misgovernance (usually, extortion) by his political rivals at Rome, rather than the vengeance of the Roman state.

Fides was personified as a goddess, with a temple on the Capitoline, in association with the state cult of Jupiter. *Fides* became a political catchword, frequently used on imperial coins to invoke the loyalty of various groups, such as the army.

Fimbria, Gaius Flavius (d. 85 BCE)

Gaius Flavius Fimbria was a Roman commander in the Marian-Sullan conflict, fighting for the Marian-Cinnan alliance. He first became involved in the Marian-Sullan conflict when he was sent to negotiate a treaty of alliance with the Samnites, who were still fighting Rome in the Social War. During the subsequent siege of Rome Fimbria killed a number of prominent opposition figures. In 86 BCE, Fimbria was appointed deputy to Lucius Valerius Flaccus, who commanded the army sent to fight Mithridates VI in Asia. While in Asia, Fimbria either organized the mutiny and murder of Flaccus, or acquiesced in it, and took over command of his army.

Fimbria campaigned extensively in Asia in 85 BCE against Mithridates' forces, defeating one of his sons at the battle of Miletopolis and driving Mithridates himself from Pergamum, winning back much of Asia for Rome. Fimbria's campaign is also noted for the sacking of Ilium, the supposed site of ancient Troy, from which Rome claimed descent. He came close to capturing Mithridates himself, besieging him in Pitane, but Lucius Licinius Lucullus' refusal to send naval forces enabled Mithridates to escape by sea. The Marian-Sullan conflict interrupted the campaign when the opposing commander Sulla crossed into Asia. Full blown military conflict was only averted when Fimbria's army deserted him and defected en masse to Sulla. This was their second betrayal of a commander in two years. Fimbria himself fled to the city of Pergamum where he committed suicide later that year, allegedly at the orders of Sulla.

First Triumvirate

The First Triumvirate (founded 60 BCE) was a political alliance between Pompey, Crassus, and Caesar. It had no official status, but was simply a combining of their political resources aimed at achieving particular individual goals.

Pompey and Crassus had been rivals since first appearing in Roman affairs helping Sulla gain control in 83–82. Following Pompey's victory in Spain against Sertorius and Crassus' defeat of Spartacus, they put aside their differences and secured a joint consulship in 70. At the time of the formation of the triumvirate toward the end of 60, the two men's requests were being blocked by conservatives in the Senate. Pompey had conducted major rearrangements of Rome's eastern possessions after his defeat of Mithridates. The Senate refused to endorse them in a single vote, but wanted to debate them individually. Pompey was also having difficulty getting a law passed to provide land allotments for his army veterans. Crassus had promoted a request by businessmen for a reduction in the price they had paid for the right to collect Asian taxes, but the Senate rejected it. Caesar, recently returned from a governorship in Spain, asked for a triumph and permission to run for the consulship *in absentia* rather than in person, as the law required, but the Senate refused him that permission; he abandoned his request for a triumph and entered the city.

The three thwarted men decided to combine their political resources to secure Caesar's election as consul for 59, so that he could push through their requests. It is usually thought that Caesar took the initiative and reconciled Pompey and Crassus, but it is more probable that these two, wealthy and far more influential and experienced, chose to cooperate again and give Caesar their support. At first the coalition was kept secret, but it became apparent with Pompey's marriage on May 59 to Caesar's daughter Julia, which cemented the alliance.

As consul Caesar pushed through legislation to satisfy his partners' requests, but he had to use force to do so. Before the end of the year he left for a five-year command in Gaul, while Crassus began sniping at his rival Pompey through the volatile Publius Clodius Pulcher. Tensions developed, showing that the coalition was inherently unstable. When threats emerged to Caesar's tenure of the Gallic command, he summoned Crassus to Ravenna in winter 56, and then they both met with Pompey at Luca to

reorganize their coalition: Pompey and Crassus planned to become consuls again for 55 and receive five-year commands in Spain and Syria, respectively, to equal the extension of Caesar's command in Gaul.

All went to plan, but when Julia died in childbirth in late summer 54 and Crassus was killed in the disastrous battle of Carrhae in June 53, the bonds were broken. Pompey drifted away from Caesar to the side of the conservatives, being made sole consul in 52 with their approval and marrying a daughter of the Metellan and Scipionic families. Pompey acquiesced in the intrigue which forced Caesar to cross the Rubicon and invade Italy, marking finally the end of their coalition.

Flamininus (228–174 BCE)

Titus Quinctius Flamininus was a patrician consul and general of the Roman Republic who defeated Philip V in the Second Macedonian War (200–197 BCE), but later fell afoul of Cato the Elder for his philhellenism and his alleged luxuries.

Flamininus hailed from the same patrician family as the legendary Cincinnatus, and his *cognomen* indicates that an ancestor(s) were high priests or *flamines*, in particular priests of Jupiter, Mars, and Quirinus. During the Second Punic War, Flamininus served with distinction under Claudius Marcellus. Flamininus was one of a few wunderkind military geniuses elected to the consulship an before the legal age, in his case at 29

for 198 BCE, just as Scipio Africanus had been so elected in the election for 205. Flaminius' candidacy was opposed by two tribunes because he had not yet served as aedile or praetor (Plutarch, *Flaminius* 2.1 mistakenly includes tribune, for which Flaminius was ineligible as a patrician), however, the Senate allowed the people to decide by permitting him to run. Flaminius was elected to the consulship with Sextus Aelius Paetus. Flaminius received the command of the Second Macedonian War against Philip V. Among Romans, Flaminius had a special advantage, for he spoke Greek excellently and understood Hellenistic culture. He was a true philhellene.

When Flaminius came to Macedon, he found the war at a stalemate. His predecessor, Publius Villius, was unable to force a successful outcome, so Flaminius assumed the command and pressured or enticed the Greek leagues and cities to join the Romans against Philip (or defect). After more diplomatic than military successes, Flaminius' command against Philip was renewed for 197, and the two fought a decisive battle at Cynoscephalae (Dogs' Heads) in Thessaly, in which Philip was completely defeated, and his army cut to ribbons. The most reliable historians agree that Macedonian casualties numbered 8,000 killed and 5,000 captured (Polybius 18.27; Livy 33.10.7; Plutarch, *Flaminius* 8.5) while Roman casualties numbered 700. It was a stunning victory that demonstrated the superiority of the flexible legion over the rigid phalanx. Philip soon sued for peace, and Flaminius imposed what was to become a Roman standard of victory. The defeated would pay an indemnity, cede territory, lose their elephants, reduce their fleet to 10 warships, give hostages, surrender any Roman captives and deserters, reduce the army, ally with the Romans, and not make war without Roman permission. When news reached Rome of Flaminius' victory and the proposed peace terms, his command was extended for a third year.

In the following year, 196, Flaminius negotiated borders and the return of prisoners. He then shocked and delighted the Greeks by announcing at the Isthmian Games that henceforth the Greeks were to be free. After a moment of disbelief, the Greeks asked for the message to be repeated. Thereupon, according to Valerius Maximus, a shout so loud arose from the gathering that it allegedly stunned birds flying overhead who fell to the ground (Valerius Maximus 4.8.5, not supported by Polybius 18.46; Livy 33.32.9; Plutarch, *Flaminius* 10.5).

Soon after, Flaminius went to a war with the tyrant Nabis of Sparta. As a Roman ally, Philopoemen of Arcadia fought bravely and according to Plutarch aroused Flaminius' jealousy. The Romans could easily have destroyed Sparta, but Flaminius chose to come to terms with Nabis, rather than destroy Sparta and allow Philopoemen equal credit for the victory. When Flaminius was challenged over this decision later, he claimed that the price of destroying Sparta was not worth the life of Nabis, but in fact Flaminius may have been concerned that a new Roman general would have replaced him and won the glory, had the war lasted much longer. In this case, he might be exonerated of jealousy of Philopoemen.

For his victory Cynoscephalae, Flaminius was awarded a triumph. On top of the gold and silver and captured weapons and prisoners, the finest adornment of the triumph was the 1,200 Roman captives from the Hannibalic War marched behind his chariot as freedmen with the *pilleus* (freedman's hat) on their heads. For as a gesture of gratitude, the Achaeans and some other Greek allies rounded up their Roman slaves and presented them, unrequested, to, who hardly knew the number of Romans Hannibal had sold into slavery to the Greeks.

Flaminius was elected censor in 189 with Claudius Marcellus, the son of his old commander, over Cato the Elder. In the long ongoing feud between Cato and Scipio Africanus, Flaminius sided with Scipio by renewing him as *princeps senatus*. Cato later retaliated after his election as censor in 184 by expelling from the Senate the younger brother of Flaminius, Lucius. Flaminius' philhellene sympathies also conflicted with Cato.

In his final act of public service, Flaminius pursued Hannibal, now a refugee from the Romans. Many of the Romans continued to fear Hannibal, for after the defeat of Carthage in the Second Punic War, Hannibal had stirred Antiochus III against the Romans in the Syrian War (191–189). These Romans felt insecure as long as Hannibal was alive. Therefore, Flaminius took the assignment to see to the death of Hannibal. Learning that Hannibal had joined the court of King Prusias of Bithynia, Flaminius demanded his surrender. Unable to escape, Hannibal took poison. However, this mother did nothing to increase Flaminius' glory, but to the contrary diminished, for it was thought that Flaminius had driven to death an old, sick man, rather than a dangerous enemy of Rome.

After retiring from public service, Flaminius died peacefully. Polybius,

who often refers to Flamininus as Titus, is a major source for this period. Flamininus is also the subject of a biography by Plutarch.

Fleets

Although never as large or critical to Rome's strength as its legions, the fleets played a vital role in Rome's military history. Despite occupying a peninsula in the middle of the Mediterranean Sea, the Romans were not originally a naval people. The First Punic War forced the Romans to learn to build and crew ships. After victory in the First Punic War, the Roman fleet proceeded to defeat the Carthaginians at the battle of the Ebro River in the Second Punic War. As Rome expanded into the eastern Mediterranean, the Roman fleet protected trade, including the essential Egyptian grain shipments, from pirates and the depredations of hostile kingdoms such as Macedonia. The fleet also played a critical role in the final defeat of Mithridates of Pontus in 73 BCE.

Equipped and structured differently from its opponents, Roman fleets used lighter vessels and emphasized boarding over the ramming and maneuver tactics that had dominated Mediterranean naval warfare since the Greco-Persian Wars. These fleets served Rome well against the Carthaginians and later opponents. Augustus equipped his fleet with light agile *liburnae*, a bireme design optimized for boarding, which by defeating Mark Anthony's and Cleopatra's more traditionally equipped fleet at Actium, ensured the demise of the trireme, quinquereme and larger banked-oar ships. Such massive ships, funded by Hellenistic monarchs, had expanded beyond easy maneuverability. All later Roman warships were founded on the bireme *liburna* design. Although ships were still equipped

with rams, boarding remained the navy's primary tactic throughout its existence.

After Actium, Augustus organized his 800-ship fleet into three, later two permanent "praetorian" fleets, each stationed at key ports near major trade routes. The Misene fleet was stationed at Misenum near Naples, while the Ravenna fleet, also created by Augustus, guarded the Adriatic Sea and naval routes eastward. In the third and fourth centuries CE, the advent of barbarian invasions, resurgent piracy and Gothic naval raids forced later emperors to shift resources to the Ravenna fleet. The fleets' primary duties during the imperial period were convoy escort, maritime policing, and troop and heavy transport, essential to logistics. The navy also maintained provincial squadrons (fleets) in key areas along the frontier. The Rhine fleet was one of the first and most active but provincial fleets were also stationed in Alexandria, Britain, on the Danube, and in Syria. Roman naval units also operated in the Red Sea, on the Tigris and Euphrates rivers and the Indian Ocean. Gothic raids led to the stationing of an imperial fleet at Constantinople in 330 CE.

As the least prestigious branch of the service, the fleets tended to recruit non-Romans from the late Republic onwards, particularly from the Greek and Dalmatian coasts. Fleet service was longest (26 to 28 years) but offered the Roman citizenship at discharge.

Unfortunately, the fleet's importance to the army's supply system and strategic mobility drew it into imperial Rome's many civil wars. These diversions from the navy's primary role depleted its ranks, and created vacuums in areas the fleet normally patrolled, inspiring piracy and raiding. Still, the fleet won more battles than it lost in its last century of existence, defeating three Gothic, two Vandal and one Cilician fleets. Never as numerous, well paid or important as the legions, the fleet nonetheless played a vital role in Rome's expansion and defense.

Formal Declaration of War

Despite the indisputable aggression that Rome displayed in the wars throughout Italy and the Mediterranean, the Romans were never able simply to march toward their enemies on a whim. On the contrary, the Roman state religion stipulated an intricate process for declaring war on an enemy to gain justification for the conflict and to ensure the approval of the gods. The fetial priests, who supervised Roman foreign policy, originally controlled the procedure for declaring war, known as the *ius fetiale* (fetial law). Over time, however, the processes required by the fetial law became impractical as Roman control spread farther into Italy, and eventually throughout the Mediterranean. In response, the fetial procedure began to change, losing much of its ethical significance and becoming much more of a formality.

The sources disagree on exactly when the fetial priests were introduced, but all point to sometime during the Roman monarchy (traditionally 753–509 BCE). According to Dionysius of Halicarnassus,

It is their (the fetial priests') duty to take care that the Romans do not enter upon an unjust war against any city in alliance with them, and if others begin the violation of treaties against them, to go as ambassadors and first make formal demand for justice, and then, if the others refuse to comply with their demands, to sanction war.

(Dionysius, *Roman History* 2.72.5)

As the excerpt shows, the fetial priests' original mission was to facilitate communication and relations with other Latin cities near to and in alliance with Rome, and thus not solely for bellicose purposes. Livy goes into great

detail regarding the specific process by which a fetial priest would facilitate a declaration of war. First, the leader of the fetial college, the *pater patratus*, traveled to the border of the accused neighbor, identified himself as the representative of Rome, recited the Roman demands, and called upon Jupiter as the witness and judge for the veracity of his claim. The priest then proceeded into the accused neighbor's territory and city, repeating his claims two more times. After the demands for restitution were delivered, the priest returned and a period of 33 days was allotted for the offender to supply recompense. If restitution was not given during this time, the *pater patratus* returned to the enemy city and announced before Jupiter that the accused had not offered redress for their transgression, and that the Roman Senate and people would now decide their fate. Having returned to Rome, the king (or, after 510, the consuls) and Senate debated on the offenses suffered by their neighbor, and accordingly, with the consent of the Roman people, voted for war. The *pater patratus* then returned to the enemy's boundary a final time and cast a blood-stained spear into their territory, thus officially delivering the declaration of war (Livy 1.32.5–14).

This procedure was feasible so long as it involved Rome's immediate neighbors in Latium or Etruria, but became impractical once Rome began to expand throughout the Italian peninsula. A key aspect to the *ius fetiale* is that the Romans were willing to adapt the tradition to accommodate for the circumstances brought on by their expanding frontiers. The first change was that senatorial *legati* (envoys) began to replace the fetial priests when delivering the demands. While Rome's other Latin neighbors had their own fetial customs and *patres patrati*, allowing for a common ground of communication, other cultures in Italy, specifically the Greeks of South Italy, did not have a fetial custom. In many ways, this religious disparity strengthened the Romans' justification for wars. Since Italian cities outside of Latium did not have a fetial tradition there was no manner for those cities to effectively contend with Rome's demands, thereby strengthening the Romans' own claims to possess the approval of the gods.

The war against Pyrrhus of Epirus (280–275 BCE) brought on a notable change, as the Romans were fighting a power originating from outside of Italy for the first time. Specifically, the Roman fetial priest or senatorial *legati* could not reasonably lead three journeys to Epirus to deliver demands, nor could they realistically throw a bloodstained spear from Roman territory into Epirote territory. According to the Roman grammarian

Servius (late fourth century CE), the Romans accommodated for the distance from Epirus by capturing an Epirote soldier, selling him Roman land, and then throwing the spear into the captive's small plot, thus satisfying the final requirement for the fetial custom (Serv. *Aeneid*. 9.52). This emphasis on technicalities illustrates the legal aspect of the *ius fetiale*, and shows that the Romans were insistent on demonstrating their justification for war to the gods.

As Rome became involved in conflicts throughout the Mediterranean, the *ius fetiale* changed further. Some scholars have argued that the tradition had completely faded away by the late second century BCE, but a close inspection of the literary evidence shows that the fetial custom survived albeit in a reduced and evolved manner. There was no longer any question of the feasibility for multiple trips to an enemy's city, and the formalities for declaring war were now entirely in the hands of senatorial envoys. In fact, the innovations made in the fetial custom demonstrate the power of tradition. By the late second century, ambitious aristocrats often manipulated circumstances to create the pretexts for wars. In this context the fetial custom did remain as a true expression of religious piety, but evolved also into a ritual observance that facilitated the necessary formalities for declaring war (Watson 1993, 64–65). Vestiges of the fetial custom can be seen in the multiple embassies to the Carthaginians prior to the Second Punic War (218–201 BCE), the strategically placed envoys sent through Greece leading up to the Second Macedonian War (200–197 BCE), and the demands given to Perseus before the Third Macedonian War (171–168 BCE).

Many aspects of the *ius fetiale* resemble private law suits, where the fetial priests would announce their grievances to the accused neighbor before the gods as judges. If the fetial priests (or senators) failed to gain reparation for the enemy's transgressions, the Romans could go to war knowing that the gods had ruled in their favor. One result of the evolution of the fetial procedure was that the opportunity for peaceful resolution became impossible. Demands began to be set so high that the Romans seem to have expected an enemy to reject them, thus supplying a pretext to declare war with a clear conscience (see the prelude to the declaration of the Third Punic War in 149 BCE, document 10). In all instances of Roman demands leading to a declaration of war, only in 238, when Rome threatened Carthage over the affair at Sardinia, did an enemy capitulate to a

Roman ultimatum. In such a manner, the *ius fetiale* evolved into a way to obtain a desired war, rather than a way to determine the necessity and justification of war.

Formula Togatorum

In the mid-Republic, the *formula togatorum* was a document which stipulated the number of men that each allied community was required to provide for Rome’s wars. Polybius states that allied communities were required to keep lists of their men of military age (2.23–24, ca. 225 BCE). An agrarian law of 111 BCE describes Rome’s allies as “from whom the Romans demand soldiers in the land of Italy according to the *formula togatorum*.” The term *togatorum*, from *togati*, “men who wear the toga,” indicates Rome’s most immediate allies in Latium and Italy, with a similar culture as opposed to overseas allies; it also suggests adult males (Roman boys ritually became men when they donned the toga at age 16).

It is possible that the number of men each allied community had to contribute was established at the time of its treaty with Rome. At a later date, in 177 BCE, the Samnites and Paeligni could not meet their numbers because thousands of their people had migrated (Livy 41.8). However, the *formula togatorum* may have been more flexible than this and the number that each community provided changed with Rome’s requirements. The *formula togatorum* itself is not extant and has been a topic of scholarly

debate.

The allies specified by the *formula togatorum* were grouped together into *alae* (wings) that might comprise both cavalry and infantry. They were commanded by Roman *praefecti sociorum*.

Forum (Republic)

The Roman Forum was of great antiquity, being constructed upon a swampy area between the Palatine, Quirinal, and Capitoline hills that was drained and infilled in the late seventh century BCE. It became a market place, meeting place, and the political and religious center of Rome. Important political structures included the Senate House and Comitium (assembly place), and Rostra (speaker's platform, adorned with the beaks or *rostra* of ships). Important temples included the Temple of Saturn, the Temple of Vesta, and the Regia. Though Sulla and Caesar began adding more impressive public buildings to the Forum, the emperors built the Forum that is extant today, with the Temple of Divus Iulius (built by Augustus) and other restored and elaborated temples.

Forum of Augustus

The Forum of Augustus, built at Augustus' expense, was dedicated in 2 BCE, the year when Augustus was hailed as father of the fatherland. It comprised a large rectangular piazza flanked by porticoes on its long sides, which acted as venues for courts of justice. It was dominated by the Temple of Mars Ultor (the Avenger). The Forum was decorated on one side by marble statues of Rome's seven kings and of great men of the Republic who had expanded Rome's empire, and on the other by statues of Augustus' Julian ancestors and the kings of Alba Longa. Inscriptions accompanying these statues summarized each general's career and could be interpreted as justifying Augustus' anomalous powers. Augustus showed personal interest in the Forum's design, and wanted his achievements to be measured against those of Rome's famous generals of the past. Further bronze statues of triumphal generals were added over the next hundred years or so. Statues of Rome's mythical founders, Aeneas and Romulus, were complemented by a statue of Augustus in a chariot, as father of the fatherland. Paintings of the deities Castor and Pollux with Victory and of Alexander the Great further enhanced the Forum's martial flavor. The Forum played a central role in military ceremonies, becoming the venue where the Senate would meet to vote on awarding triumphs and waging wars; from where commanders set out to the provinces on their military campaigns; and where boys celebrated their coming-of-age (and, by extension, potential entry into military service).

Forum of Trajan

The Forum of Trajan was built ca. 104–112 by the emperor Trajan (98–117) as an addition to the Roman Forum and Forum of Augustus. It occupied the lower ground between the Capitoline and Quirinal hills. Two large semicircular exedrae (recesses) ascended these hills. The south was bounded by a portico facing onto the Forum of Augustus. The north side was bounded by the Basilica Ulpia, built by Trajan. To either side of a colonnaded court were two Greek and Latin libraries. Trajan's Column stood in the center. The Column's elaborate reliefs depicting the Dacian Wars may have been visible from the upper floors of the libraries. The Forum of Trajan, celebrating Trajan's victories, was probably adorned with relevant statuary such as the images of two Dacians that now stand in the courtyard of the Musei Capitolini in Rome.

Franks

The Franks were a Germanic people originally located east of the Rhine River. In 358 CE, the Salian Franks were defeated by the Caesar Julian (later emperor, 361–363). Given the status of *foederati*, the Salian Franks were

settled in Roman territory near the mouth of the Rhine. During the late fourth century, several Franks rose to prominence in the Roman army and played key roles in Roman politics. Flavius Richomer, more commonly referred to as Richomer (not to be confused with the mid-fifth century general Ricimer), was a Frank who took service in the Roman army during this period. He eventually held the positions of *comes*, *magister militum*, and consul. His son Theudemeres became a king among the Franks while his nephew Arbogast took service with Rome. In 388, Theodosius I sent Richomer to suppress the rebellion of Magnus Maximus. Richomer then served Theodosius as *comes et magister utriusque militiae* until his death in 393.

After the capture and execution of Magnus Maximus, Theodosius I elevated Valentinian II, the son of Valentinian I, as western emperor. Richomer's nephew Arbogast, as *magister peditum* in the western empire, was ordered to consolidate Valentinian's rule in the west, which he did by eliminating Victor, the son of Maximus and a potential rival to Valentinian II. Subsequently Arbogast was promoted to *magister militum*. Arbogast, however, overthrew the young Valentinian II, who either committed suicide or was murdered in 392. Arbogast then promoted the civilian Eugenius as emperor in the west. Theodosius I refused to recognize Eugenius as emperor and moved his army into Italy. At the battle of the Frigidus River (394), Arbogast and Eugenius were defeated. Eugenius was captured and executed, while Arbogast committed suicide.

In 451, the Salian community was divided in support of two claimants to the Salian throne, one backed by Aetius and the Romans, the other backed by Attila, king of the Huns. This conflict was one of the reasons Attila chose to invade Gaul in 451. Attila entered Salian territory and presumably placed his ally on the throne, then advanced on Orleans. Driven away from Orleans, Attila met the combined Roman and Visigothic army at the battle of Châlons. In this battle, Franks appear to have fought on both sides.

A generation later the Salian Franks seem to have provided the core of the newly emergent kingdom of Tournai ruled by Childeric I. Historians refer to this period in Frankish history as the Merovingian dynasty, beginning from the accession of Childeric I to the Frankish throne in 481 and continuing down to 751. During this period the Franks, having converted to Roman Catholicism and having adopted Latin as an elite language, began to develop Old French, the ancestor of the modern French

language.

Frīgīdus, Battle of the (394 CE)

The battle of the Frīgīdus (394 CE) was fought between Theodosius I (379–395) and the western usurper Eugenius near the Frīgīdus River (modern Isonzo), bordering north-western Italy, on September 5–6, 394. The *magister militum* Arbogast had proclaimed Eugenius emperor in the west after the suicide or suspicious death of Valentinian II in 392. Theodosius rejected Eugenius’ legitimacy and assembled his armies to defeat Eugenius in May 394, to secure his son Honorius as western emperor. Theodosius’ army was reinforced with 20,000 Gothic warriors, previously settled in Moesia, while Eugenius’ army was reinforced by several thousand Frankish and Alamanni auxiliaries. Arbogast commanded Eugenius’ forces, making a defensive camp in the mountain valley near the Frīgīdus. During the first day of battle, Theodosius’ forces suffered heavy casualties. Theodosius also allegedly stationed the Gothic auxiliaries deliberately in the front line to kill them off, where they suffered 10,000 casualties.

On the second day, some cavalry of Arbogast defected to Theodosius’ army but both sides were still evenly matched in battle. Christian sources state, however, that Theodosius received the aid of the Bora wind, a katabatic wind blowing downslope from a mountain range, carrying dust with it that threw the forces of Arbogast and Eugenius into disarray, allowing the eastern army to break through and defeat them. In the aftermath of the battle, Eugenius was executed and Arbogast committed suicide. Theodosius I emerged briefly as senior ruler over the entire empire until his death in January 395. Together with the defeat of Magnus Maximus, the battle of the Frīgīdus imposed a massive strain on the western

Roman army from which scholars have argued that it was never able to fully recover during the fifth century. Theodosius' mistreatment of Gothic soldiers also sowed the seeds of Alaric's mutiny, leading to the sack of the city of Rome in 410 CE.

Frontiers

In *The Grand Strategy of the Roman Empire: From the First Century A.D. to the Third* (1976, rev. ed. 2002), modern strategic studies expert Edward Luttwak argued that in the early Roman empire, the Romans projected force beyond their borders, shifting to a more defensive and linear concept of frontiers in the middle empire when linear *limes* works (walls and ditch and road systems) were constructed in north Britain, Germany, Africa, and elsewhere.

Scholars within classical studies and archaeology challenged Luttwak's account by emphasizing cultural aspects of Roman frontier policy (see in particular Whittaker 1994; Mann 1979; Mattern 1999). Within the literary tradition, Romans do not appear to be very conscious of linear frontiers, let alone the need to geographically project force beyond them or maintain rigid defensive barriers. These are modern concepts dependent on the possession and use of accurate two-dimensional maps. Map-making was very inadequate in the ancient world; the Romans calculated distances along roads, but otherwise viewed their domination in terms of control or influence over peoples. Furthermore, frontier works such as Hadrian's Wall and the ditch system in North Africa (*fossatum Africae*) were intended to be permeable and let local peoples move back and forth. The army kept watch

over their movements rather than maintaining a rigid barrier. The Romans viewed the political submission of frontier peoples and of external peoples as more important; in imperial ideology peoples far beyond the frontiers did homage to Rome.

According to Luttwak, in the later Roman Empire, inferior frontier forces (*limitanei*) served to detain any enemy who broke into the empire, until the central field force arrived to combat the enemy. The frontier troops were dispersed in the frontier provinces, thus “defense in depth.” Luttwak attributes this strategic policy to the emperor Diocletian (284–305) and Constantine I (306–337). The strategy contrasts with that of the earlier Principate in which the Romans sought to contain enemy forces beyond their borders, defending their borders with linear frontier installations (*limes* works) and projecting force beyond them. In the later Roman Empire, since the Romans no longer projected force beyond their borders, the empire was inevitably eroded, leading to its collapse in the west.

The theory of “defense in depth” has been challenged particularly by Benjamin Isaac, a Roman frontier archaeologist and historian, who argued in *The Limits of Empire* (1988, rev. ed. 1992) that Roman soldiers were dispersed in the countryside not to combat external enemies but to maintain internal security, suppressing revolt, and policing potentially rebellious subjects. Isaac focuses on Roman Judaea, where low-intensity internal conflict involving resistant Jews was common. Many other provinces, particularly in mountainous areas, had such low-intensity conflict, usually termed “banditry.” Because the emperor’s power rested upon the army, the army’s maintenance of internal control was as strategically important as its use against external threats.

Furthermore, the Roman army, being the largest body of trained and disciplined personnel at the Roman state’s disposal, was employed for many other purposes besides defense (Fuhrmann 2012). Soldiers’ additional duties included policing and guard duties; attending and assisting provincial governors and other officials; collecting taxes, customs duties and other imposts. In modern nations, civilian officials perform most of these functions. Military installations within Roman provinces may have had a variety of purposes, including defense, internal policing, and other activities. Hence, it is difficult to prove that the purpose of later Roman military installations was “defense in depth.” Furthermore, even in the later Roman Empire there is substantial evidence that Roman emperors and

armies continued to carry out military offensives and expeditions beyond the frontiers.

Frontinus (ca. 30–after 100 CE)

Sextus Julius Frontinus was a notable Roman senator, administrator, military officer, provincial governor, and author of two surviving technical treatises, the *Stratagems* and the *Aqueducts*. He held a praetorship in 70, the consulship in 72 or 73, and was governor of Britain in 73/74–77, conquering Wales for the Roman Empire. He may have commanded in Domitian's war against the Germans in 82/83. Frontinus was proconsul of Asia in 86, a highly distinguished post; he was then *curator aquarum* (in charge of the water supply of Rome) in 97, and held two more consulships in 98 and 100.

Frontinus' *Stratagems* is a collection of military anecdotes from Greek and Roman history and biography, arranged topically to illustrate various

tactical and strategic concepts, such as “on hiding one’s decisions” from the enemy. The Greek term *stratagemata* connoted “tricks” or deceptive tactics rather than modern formal or grand strategy. Frontinus also displays a moralistic approach, idealizing Rome’s great leaders of the past, such as Scipio Africanus, Fabius Maximus, and Cato the Elder.

Frontinus’ *De aquis urbis Romae* (*Aqueducts*) concerns the water supply of Rome, a city of over a million inhabitants in the first century CE for which the provision of fresh water was a vital necessity. He describes the construction of aqueducts and thus is a major source on Roman engineering techniques.

Fulvia (d. 40 BCE)

A Roman noblewoman of the late first century BCE, Fulvia was actively involved in the politics of the last decades of the Republic. She was married to Publius Clodius Pulcher (92–52 BCE), the populist tribune who became a major enemy of Marcus Tullius Cicero. After Clodius was assassinated by Milo’s followers in 52, Fulvia sought justice for Clodius, exhibiting his body to the Roman crowd and provoking a riot. Milo was prosecuted for the death of Clodius and was defended by Cicero. Fulvia next married Gaius Scribonius Curio, a tribune of the plebs in 50 BCE and a Caesarian officer. Curio was killed in Caesar’s African campaign. Since Curio had been a patron and friend of Mark Antony’s, the widowed Fulvia married Mark Antony, whose interests she proceeded to defend passionately.

Fulvia played an active role during the triumviral proscriptions in 43–42 BCE, in which the triumvirs Octavian, Antony, and Lepidus targeted political and personal enemies, putting prices on their heads and confiscating their property. Fulvia is said to have particularly sought the death of Cicero, whose *Philippics*, orations targeting Mark Antony, also targeted her. After Cicero’s execution, Fulvia allegedly mistreated his severed head, pulling out

his tongue and sticking it with her hairpins.

Fulvia is noted also for her command of the siege of Perusia. Fulvia and her husband's brother Lucius Antonius roused the Italians against Octavian and were besieged by Octavian at Perusia (41–40 BCE; Appian, *Civil Wars* 5.32–49). Though Roman women were normally excluded from military affairs, their participation in the defense of a besieged city was more acceptable (cf. Caesar, *Civil War* 3.9, the Roman colony of Saloniae during the Caesarian civil war). The soldiers of Octavian and of Lucius Antonius inscribed insults on sling bullets, some of which were sexual in nature and intended to embarrass Fulvia and Octavian. Perusia eventually fell to Octavian, who spared Lucius Antonius; Fulvia fled to Greece, where she died of an illness a short time later. After Fulvia's death, Mark Antony then married Octavian's sister Octavia as part of the Treaty of Brundisium alliance (40 BCE).

Nonetheless Fulvia's personality became part of Mark Antony's bad reputation, elaborated by Cicero and embellished by Octavian's propaganda: she was said to dominate Antony, preparing him for his defection to Cleopatra. Fulvia's reputation has been analyzed in terms of Roman stereotypes of male/female behavior. A woman with masculine traits such as Fulvia possessed was contrary to Roman social norms and to represent her thus was a strategy of insult.

A different Fulvia played a minor part in the suppression of the Catilinarian Conspiracy in 63, exposing the conspirators to Cicero.

G

Gaius Gracchus (ca. 154–121 BCE)

Gaius Sempronius Gracchus, the younger brother of the *tribunus plebis* Tiberius Gracchus, himself held the tribunate of the plebs in 123 and 122 BCE. During his tribunate, Gaius Gracchus promoted land redistribution and the extension of the Roman citizenship in Italy, and other sweeping reforms, but was killed by the Senate in an extrajudicial purge.

As a young man, Gaius Gracchus served on his brother's land commission and served as quaestor in Sardinia, where he was known for his probity. Following the murder of Tiberius Gracchus at the hands of a senatorial lynch mob, Gaius Gracchus was widely expected to take up his brother's cause. He did so, being elected as tribune in both 123 and again in 122 BCE. During his two years of office, Gaius Gracchus produced a legislative program with far wider aims than his brother's. The chronology of these measures is controversial, as are some of the measures themselves.

In terms of the land issue, Gaius Gracchus reissued his brother's law of 133, which resumed the distribution of *ager publicus* to Roman citizens. The redistribution of public land was intended to promote military recruitment by enlarging the pool of eligible citizens. Gaius Gracchus went further by proposing distribution of land outside Italy by founding new city colonies, including one on the site of Carthage itself. Gaius Gracchus also provided for the army with legislation that required legionary clothing and equipment to be funded at public expense and that barred the recruitment of youths under the age of 17.

Gaius Gracchus also targeted corruption and misgovernment. One of his laws required that the Senate, which assigned provinces to governors, must designate all provinces before the election to discourage favoritism. He also

assigned tax collection in Asia to merchants termed *publicani*, who bidded for the right to collect taxes. This policy, administered by the censors, later became unpopular with the provincials, but Gaius Gracchus hoped to discourage corruption by taking tax collection away from governors and their staff. Another notable Gracchan measure was the state issue of grain, the staple diet of an average Roman citizen, to the inhabitants of Rome, at a subsidized rate.

Following his re-election for 122, which in contrast to Tiberius Gracchus' campaign was without notable incident, Gaius Gracchus introduced more sweeping governmental reforms. Hitherto the juries in the *quaestiones perpetuae*, the criminal courts for trying corruption and misgovernment, had been mostly senatorial and the trials had been used by nobles to attack political rivals with little effect on corruption. Gaius Gracchus assigned the juries to equestrians, reducing senatorial influence over the outcomes and ensuring fairer trial of senators. Gaius Gracchus' most drastic measure proposed to extend the Roman citizenship throughout Italy, making Latins Roman citizens and allies Latins. This measure had actually been proposed earlier, in 125 BCE, by the consul Marcus Fulvius Flaccus, an ally of the Gracchi. Both the jury and the Italian proposals would have extended Gaius Gracchus' power base. Gaius Gracchus clearly favored the equestrian order, themselves not an altogether separate class from the senatorial elite, by his measures for the *publicani* and equestrian juries. Perhaps his most important proposal was the extension of the Roman citizenship throughout Italy (albeit in a controlled manner), an issue not resolved until the Social War.

Thus Gaius Gracchus went far beyond his brother's scope in terms of legislation. His motives were debated by ancient and modern authors, but the scope of these laws and proposals shows a desire to rapidly alter the shape of the Roman political landscape. Such reform also benefited Gaius Gracchus' supporters, *plebs* and Italians. The more traditional nobility regarded sweeping, rapid political reform and popular measures with horror, but Tiberius Gracchus and his supporters' violent deaths had also shocked the political class.

In response to Gaius Gracchus, the Senate initially adopted a more measured approach than they had used against his brother and set about undermining his support, certainly within Rome itself. One of Gaius Gracchus' fellow tribunes of 122, Marcus Livius Drusus, proposed his own

program of colony foundation on a reduced scale and vetoed the measures on extending the citizenship throughout Italy. On this occasion there was no resultant deposition of Drusus, perhaps because the urban populace of Rome was unwilling to share citizenship rights with the inhabitants of Italy. Thus Drusus presented a more subtle opposition to Gaius and not one that could easily be ignored. Furthermore, Gaius Gracchus spent some time outside Rome, organizing the foundation of the colony on the site of Carthage. His absence did not help his popularity. As a result of Drusus' efforts and his own absence, Gaius Gracchus failed to be elected for a third consecutive tribunate, for 121 BCE.

The following year, with Gaius no longer a tribune, the Senate made its move, via a compliant tribune, to annul some of his previous legislation. When the day came for the measure to be passed, Gaius Gracchus and his supporters protested at the assembly, during which a servant of Lucius Opimius was killed. Opimius, one of that year's consuls, was a noted opponent of Gracchus and used this death to argue that Gaius Gracchus was attempting armed sedition, a charge leveled against his brother Tiberius Gracchus. On this occasion, rather than resort to a religiously sanctioned lynching, Opimius urged and the Senate passed a unique decree known as the *senatus consultum ultimum* (the ultimate or final decree of the Senate), equivalent to martial law: it suspended the usual laws and the civil rights of citizens. Gaius Gracchus and his supporters retreated to the Temple of Diana on the Aventine, but were then hunted down and killed; when his capture was imminent, Gaius himself committed suicide, ordering his slave to kill him (Appian, *Civil Wars* 1.26; Plutarch, *Gaius Gracchus* 17).

Thus Gaius Gracchus met the same fate as his brother, murdered at the hands of the Senate, but left an even more divisive legacy. In particular, his promotion of equestrian and Italian interests raised issues that were not resolved with his death, but contributed to the instability which plagued the late Republic and in particular the Social War of 91–87 BCE.

Galba (Emperor) (68–69 CE)

Servius Sulpicius Galba, a Roman senator from a distinguished patrician family, revolted from the emperor Nero and claimed the imperial power in 68 CE. His personality and policies alienated the Praetorian Guard, whom Marcus Salvius Otho persuaded to assassinate Galba on January 15, 69. Galba’s adopted heir, Lucius Calpurnius Piso Frugi Licinianus, was also assassinated.

Galba represented the last of the old aristocracy at Rome and lived through the reigns of Tiberius, Gaius, Claudius, and Nero. He was appointed governor of Aquitania, governor of Upper Germany during the reign of Gaius, and governor of Africa (ca. 44–51). He was governor of Hispania Tarraconensis from 60 to 68. In 68, Galba was solicited by Gaius Julius Vindex to support his revolt. Galba himself was hailed as emperor by his troops, and upon Nero’s death proceeded to Rome and was accepted by the Senate.

Galba alienated the armies through the harshness of his policies toward them. Already known for severe discipline during his governorship of Upper Germany, he inflicted decimation on the legion constituted from fleet soldiers who requested that he formally recognize them as a legion. Galba also alienated the praetorians. Though Nymphidius Sabinus, then praetorian prefect, had promised the praetorians that Galba would give them a large donative, Galba as emperor refused to give this donative, saying, “I levy my soldiers, I don’t buy them” (Tacitus, *Histories* 1.5). Tacitus relates that the praetorians regarded this refusal as a personal insult; they would have been satisfied with a small gift, a token of the emperor’s respect for them

(Tacitus, *Histories* 1.18). Galba was believed to be very wealthy in his own right, adding to the odium of his parsimony. At age 72, he seemed both harsh and inflexible, and weak, excessively dependent on three subordinates, Titus Vinius, Laco, and his former slave Icelus.

Galba had no sons and adopted as heir a young man, Calpurnius Piso Frugi Licinianus, who had a similar old-fashioned, severe reputation. Otho, who had hoped to be adopted by Galba, was displeased. Accordingly, Otho subverted the praetorians with bribes and personal favors. On January 15, the praetorians carried Otho off to their camp in Rome and hailed him as emperor. Galba was seized and assassinated by the praetorians, who also assassinated Piso. Otho was recognized and accepted as emperor in Rome and Italy, though his reign would be short, lasting only until April 69 when he was defeated in battle by the Vitellians.

The main sources for Galba's life and reign are Tacitus' *Histories*, Suetonius' *Galba*, Plutarch's *Galba*, and Cassius Dio's *Roman History*. Tacitus emphasizes Galba's incompetence; Suetonius adds uncritical biographical information. Plutarch's *Galba*, much more favorable to Galba than Tacitus' *Histories*, provides some additional information about the first months of Galba's reign. Dio's *Roman History*, surviving in epitome for this period, probably followed Plutarch. Scholars have examined Galba's coin issues as evidence of his actual policies and political stance; however, the extent to which emperors controlled the images and legends on their coinage as a mode of propaganda is uncertain.

Galerius (Emperor) (305–311 CE)

Galerius (Caesar 293–305, Augustus 305–311) was one of the Tetrarchs. His full name was Gaius Galerius Valerius Maximianus, and he is often termed Maximian in the ancient sources, but usually termed Galerius by modern scholarship to avoid confusion. A vigorous general, Galerius was notable for winning great victories over the Sassanid Persians in 297–8. He is also best known as the instigator of the “Great” Persecution of the Christians (303–311). Accordingly, Christian authors disparaged his character, depicting him as barbarous and cruel. However, Galerius remained loyal to Diocletian and attempted to salvage the Tetrarchic system after it began to break up into civil warfare.

Little or nothing is known of Galerius’ youth. He was probably born in the 250s in eastern Illyricum. Lactantius claims that he was Dacian, in which case his family will have evacuated Dacia ca. 270–275 to settle elsewhere. Lactantius also claims that his mother, Romula, was a pagan priestess (a position of some local prestige), influencing him to hate the Christians. Galerius entered the army and advanced rapidly in the army and administration. He probably held high office before he was raised to the rank of Caesar in 293.

As Caesar, Galerius took command of the Roman war with Persia, which had broken out afresh in 296 due to the accession of a new ruler, Narses. Galerius lost his first battle with Narses’ forces between Callinicum and Carrhae, angering Diocletian, who let him try again. Galerius first invaded through Armenia with great success (297). The next year, he advanced down the Tigris and captured Ctesiphon, the Persian capital; he then returned up the Euphrates (298). In 299, the Romans negotiated a peace with the Persians at Nisibis on very favorable terms to the Romans. Galerius had restored Roman control of the eastern frontier up to the River Tigris and avenged the defeat and capture of the emperor Valerian in 260. When not fighting the Persians, Galerius assisted Diocletian with campaigning against Germanic peoples and Sarmatians on the Danube.

According to Lactantius, Diocletian was allegedly influenced by Galerius to persecute the Christians in 303, based on Galerius’ personal hatred of Christians and Diocletian’s fear of Galerius, who had become arrogant after his Persian victory. This story inverts the official relationship of Augustus and Caesar, and denies Diocletian sound Roman traditionalist

reasons to attempt to suppress the new religion. It also emphasizes Galerius' personal cruelty and barbarity.

At Diocletian's abdication in 305, Galerius was promoted to the rank of Augustus, together with Constantius I. Courtiers may have expected that Constantius' son Constantine and Maximian's son Maxentius would become Caesars. Instead, according to Lactantius, Galerius influenced Diocletian to name his own friend Severus and nephew Maximinus II Daia as Caesars. The truth is not known; Diocletian may have intended to favor adoptive (nonhereditary) succession, yet the choice of Maximinus appears dynastic.

On the death of Constantius I in July 306, Galerius automatically became senior Augustus, and Constantine I revolted at York. The revolts of Maxentius and the ex-Augustus Maximian followed. For his part, Galerius attempted to hold the Second Tetrarchy together. Severus, now Augustus in the western empire, lost to Maxentius and was captured and executed. Galerius invaded Italy, but did not save the situation. He called a conference of all the emperors (including Diocletian, living in peaceful retirement at Spalato) at Carnuntum in November 308. Here Maximian was induced to retire, and Licinius (a friend of Galerius) was promoted to Augustus; Constantine and Maximinus only received the rank of Caesar, and Maxentius did not get even that. Subsequently, Galerius recognized Constantine and Maxentius as having the status of Augustus. Galerius became very ill in 311, and died after a long, painful illness, described in detail in Lactantius' *On the Deaths of the Persecutors*. On his deathbed, Galerius rescinded the persecution. His wife, Diocletian's daughter Valeria, attended by her mother Prisca, were forced to flee from Maximinus (whom the widowed Valeria refused to marry) and Licinius, and were eventually killed by Licinius' men.

Galla Placidia (Empress) (ca. 390–450 CE)

Aelia Galla Placidia, daughter of Theodosius I, was a Roman empress and briefly Visigothic queen, and perhaps the greatest example of the strong political women of the Theodosian dynasty.

Captured by Alaric in the sack of Rome in 410, Galla wed Alaric's successor Athaulf in 414. Intelligent, pious, and charismatic, Galla briefly became central to Roman diplomacy with the Visigoths; Athaulf and Constantius III (Honorius' *magister utriusque militiae*) bargained over her while the Visigoths jostled for position in Gaul. Athaulf was overthrown in 415, and after public humiliations Galla was rescued and returned by King Vallia to Ravenna in exchange for alliance with Rome. In 417, Galla (reluctantly) married Constantius; their children were Valentinian III and Honoria. Constantius was briefly elevated to co-emperor with Honorius in 421, but did not rule long.

Galla involved herself in episcopal politics, and after Constantius' death from illness in 421, she promoted Valentinian's claim to succeed as emperor after Honorius, who had no sons of his own. Galla's attempts to persuade her half-brother were undercut by intrigue and factions at court, resulting in her exile to Constantinople. After Honorius' death in 423 and the usurpation of Johannes (423–425), Galla inspired her nephew Theodosius II (408–450) to impose dynastic succession on the western empire: in 425, six-year-old Valentinian III (425–455) was installed as western emperor, and Galla began her regency at Ravenna. She genuinely ruled from behind the scenes, but there was no precedent nor institutional framework for female rule, and one of her major concerns was balancing the competing generals Boniface, Felix, and Aetius, against the backdrop of the barbarian takeover

of Spain and Africa, and the advance of the Huns. By 437, Aetius had wrested control for himself from Galla, and Valentinian ruled in his own right. Afterward, the empress continued to play a role in familial and papal politics, becoming a vital link holding the Theodosian dynasty—and thus the two empires—together, until her death in November 450.

Gallic Empire

The Gallic empire was a separatist state, which existed independently of the Roman Empire between 260 and 274 CE. It was established when the governor of Germania Inferior, Marcus Cassianius Latinus Postumus, staged a revolt in Cologne that resulted in the murder of Saloninus, a son of the emperor Gallienus. Postumus declared himself emperor and was recognized throughout most of Gaul, Britain, and Spain. The Gallic realm was established on the model of the Roman Empire itself, with its own senate, consuls, and coinage.

Gallienus invaded Gaul in 265 CE and achieved some success against Postumus, but the campaign was soon abandoned after he was wounded in battle. Then, in 268 CE, Gallienus' cavalry commander Aureolus was to launch a second invasion; this too ended in failure after Aureolus mutinied against Gallienus instead. But the Gallic empire was soon destabilized by its own internal problems. Postumus himself was killed in 269 CE by his own

troops, when he prevented them from sacking the city of Mainz. He was replaced in rapid succession by Marcus Aurelius Marius and Marcus Piavonius Victorinus. In response to this upheaval, the Spanish provinces rejoined the central Roman Empire, and the new emperor Claudius II Gothicus sent an expeditionary force into Gaul to increase the pressure. Victorinus was himself murdered in 271 CE, and succeeded by Gaius Esuvius Tetricus, the governor of Aquitania. He reigned until 274 CE, when the emperor Aurelian invaded Gaul, and Tetricus surrendered himself. As a reward, he was given the governorship of the Lucanian region of Italy.

Gallic Revolt (69–70 CE)

The Gallic Revolt of 69–70 CE was a major revolt that involved the Rhine frontier of the Roman Empire and the provinces of northern Gaul (modern France). It was triggered by the civil war of 69 CE (the War of Four Emperors), in which Aulus Vitellius was proclaimed emperor by the Rhine legions in January 69. Most of the legions followed his two generals, Aulus Caecina and Fabius Valens, south to Italy, leaving the northern frontier under strength. The Vitellians quickly defeated the emperor Otho, but were soon challenged by a new usurper, Vespasian. Native leaders of the Batavians, a Germanic people occupying the Rhine delta area, took advantage of the Roman imperial power's distraction, assaulting Roman legionary bases. Two Roman legions were defeated, and some Roman legionaries defected to the enemy. The native Gauls soon joined the revolt. The revolt was only suppressed in 70 when Petilius Cerialis brought more legions north to fight the Batavians and Gauls.

An immediate cause of the revolt was Roman recruiting officials' mistreatment of the Batavians, who instead of paying tribute furnished

recruits to the Roman army. In particular, Roman recruiting officers are depicted as practicing extortion and sexually molesting Batavian youths (Tacitus, *Histories* 4.14). Longer term causes include native religion and the probable disaffection of Romanized auxiliary soldiers and veterans who faced inferior conditions of service and a glass ceiling to promotion. The main source, although incomplete, is Tacitus' *Histories*.

Notably, the named leaders of the revolt, the Batavian leader Julius Civilis and the Gallic leaders Julius Classicus and Julius Tutor, were auxiliary veterans and Roman citizens. Their names suggest that their immediate ancestors in the male line received the Roman citizenship from Julius Caesar or Augustus. Their fathers or grandfathers had probably also served as auxiliaries, receiving the citizenship as a reward. Civilis and his peers probably benefited from family connections, as they became auxiliary officers, but were unable, due to the structure of the Julio-Claudian Roman army, to rise further. Auxiliary prefects (commanders of cohorts or cavalry units) might be promoted to tribune in a legion or into the civil administration, but at this time such promoted officers were more likely to be Italian. Tacitus depicts the auxiliaries as revolting against legionaries, who had more privileged terms of service and discharge benefits; this degree of hostility, rather than mere rivalry, is not apparent elsewhere. Civilis, furthermore, had personal grudges against the Roman administration, as he had been detained twice on suspicion of treason.

Another possible cause of Gallic disaffection was native religion, particularly Druidism. The Roman emperors took a dim view of Druidism due to its associations with potentially seditious prophecy. Druids as native "wise men" resembled astrologers, a group that the Roman authorities periodically expelled from the city of Rome; Tiberius and Claudius had banned the practice of Druidism. Tacitus relates that a Germanic prophetess, Veleda, supported Civilis' revolt, and that the Gauls and Germans were elated by the news of the burning of the Capitoline Temple of Jupiter in Rome in December 69, because they claimed that it portended the fall of the Roman Empire.

The Gallic Revolt displays the pattern in which peripheral areas of the Roman Empire tended to revolt and even to elevate local rulers (who claimed the title of emperor) at times of crisis elsewhere. Gaul elevated its own emperors, Postumus and Tetricus, during the crisis period of the mid-third century CE, and elevated another emperor, Avitus, during the period

preceding the fall of the western empire in the fifth century CE. These “Gallic empires” did not mean that Gaul was regarded as a separate nation. It is notable, though, that in the Gallic Revolt none of the Batavian or Gallic leaders claimed the title of emperor.

The main literary source for the Gallic Revolt of 69–70 is Tacitus’ *Histories*, particularly Books Four and Five, though Book Five is only partially preserved. Tacitus presents the views of Civilis and the rebels and of Petilius Cerialis in set speeches which, as often in ancient historiography, represent the author’s opinions, dramatize conflicts, and are probably not based on factual speeches. Tacitus’ presentation of the Batavian and Gallic Revolt is, as usual with Tacitus, layered with ambiguity and ideology.

21 CE saw the lesser revolt of the Treveri Florus and Sacrovir.

Gallic Wars, Causes

The immediate causes of the Gallic Wars were the alleged threat of the Helvetii, an Alpine people relatively close to Roman territory, and Julius Caesar’s own desire for the prestige and plunder of conquest. Broader factors include migration and cultural shifts in the late Iron Age societies of this region, and the Roman Republic’s political structure based upon aristocratic competition and military values.

Caesar depicts the Helvetii as a severe threat to Roman interests, suggesting in his commentaries that they might cross the Alps into Roman territory. To combat the Helvetii, Caesar and his advisers were drawn into

the political world of the peoples of southern Gaul. It was common Roman practice to actively foster and exploit such relationships, particularly by granting favored groups privileges and influence in return for access to resources.

Victory against the Helvetii could provide plunder Caesar needed to pay back the massive debts he had accrued in political campaigns at Rome, in addition to providing funds to pay and provision his army. Though the state guaranteed these funds, their transport from Rome to Gaul was slow and risky. If he did not treat his troops well, he could expect mutinies.

Military victory would not only increase Caesar's political influence, but would justify extension of his command in Gaul (initially limited to five years), enabling him to avoid prosecution by his opponents. Magistrates in office could not be prosecuted. Once Caesar became a private citizen, he would become vulnerable.

A major long-term cause of the Gallic Wars was the orientation of Roman elite society and government toward warfare. For Roman aristocratic males, a successful political career was closely interwoven with military responsibilities. Aristocrats competed strenuously for military glory, exemplified by the awarding of a triumph, the victory procession through the streets of Rome.

Gallic Wars, Course

Between 58 and 50 BCE, Julius Caesar and his army conquered Gaul, a region covering what is now modern France, Belgium, and the Netherlands. Caesar also attempted an invasion of Britain across the English Channel. The main source for the Gallic Wars is Caesar's *Gallic Wars*, supplemented by Caesar's officer Aulus Hirtius. For the most part, independent sources are lacking; Caesar's representations dominate the narrative of the Gallic Wars.

The Gallic Wars began soon after Caesar arrived in his provinces (Cisalpine Gaul and "Transalpine" Gaul, that is, Narbonne) in 58 BCE. Gaul proper, or Gallia Comata, northward to the English Channel and eastward to the Rhine, was unconquered territory. The Helvetii, an Alpine people forced to migrate due to pressure from Germanic peoples, requested his permission to cross Roman territory to relocate further west. On hearing the news, Caesar quick-marched his troops to the Rhône, the border of the province, and destroyed the bridge to prevent their crossing. He later formally refused their request, justifying the future Roman use of force. After unsuccessful attempts to cross the Rhône and the Saône rivers, the Helvetians were defeated in the battle of Bibracte and surrendered. They became Roman allies and returned to their original lands.

Caesar then encountered Ariovistus, leader of the Suebi, a Germanic people. By this point Caesar had allied with the Gallic Aedui, who earlier had been defeated by Ariovistus. The Sequani and a number of other peoples joined them to ask for Roman support. This campaign would be more difficult, as the Suebi had been too powerful for a coalition of Gallic peoples to expel. Just as troublesome was Ariovistus' status as a Friend of the Roman People, a title given to client monarchs obligated to Rome. Regardless, Caesar attacked Ariovistus and the Suebi and drove them back across the Rhine.

The following spring, Caesar campaigned in northern Gaul. These peoples, especially the Nervii, responded with guerrilla tactics, where Rome

was at a disadvantage. The Romans responded quickly with battle at the River Sambre. Caesar then besieged and defeated the Belgic Aduatuci, rejecting their deceptive attempts at negotiation.

Matters in Gaul remained unsettled. Several peoples, including the Veneti of northwest Gaul and the Aquitani of southwest Gaul, revolted in 56. Unrest began in spring 55 among the Usipetes and the Tencteri, both Germanic peoples who had migrated to Gaul. Here again Caesar represents the Germans as not to be trusted; despite their diplomacy, they attacked treacherously, resulting in a humiliating defeat of his auxiliary cavalry. He refused the apology of the Germanic leaders and attacked their camp, massacring as many as 400,000 Germans. At Rome, Caesar's enemies used this incident to argue that Caesar should be recalled for the Roman equivalent of war crimes—a betrayal of *fides* (loyalty) toward allies. The proposed trial was politically motivated, as the Romans normally showed little compunction toward killing and enslaving enemy peoples.

The next month Caesar led his army across the Rhine over a bridge built for this purpose, a direct response to the German peoples, who had asserted that Roman power did not extend east of the river. Caesar had his soldiers destroy the bridge after crossing back to Gaul, to impress these peoples further as well as hinder any possible advance.

Caesar then directed the first Roman invasion of Britain in 55 to counter those who allegedly had given assistance to the Belgae. As significant was Caesar's desire to explore a region new to Rome. However, the campaign was a great disappointment. Inadequate intelligence left the Roman army unprepared to land safely; in addition a hostile British army awaited Roman soldiers approaching the shore. However, the Romans forced the Britons to accept terms. In the second invasion of Britain in 54, despite greater success, the Romans still achieved no permanent occupation. During this period, there were signs that several Gallic peoples planned to revolt during Caesar's absence. Therefore, Caesar left behind Labienus, his most trusted legate, in command of half the Roman forces. Caesar soon defeated Cassivellaunus, the Britons' most powerful leader, and claimed victory. However, Caesar decided to withdraw to Gaul for the winter. While bad harvests made it necessary to garrison the legions separately, Caesar did not reduce the amount of grain requisitioned. The pressure this caused in addition to already existing resentment of Roman control strengthened Gallic resistance.

The Eburones, of northeastern Gaul, were first to revolt in winter 54–53, attacking a detachment of soldiers from the force commanded by Sabinus and Cotta. During later negotiations, the leader of the Eburones, Ambiorix, informed them of plans for coordinated attacks on all the Roman winter camps and suggested that Sabinus and Cotta withdraw, swearing to protect them on the march. Despite sharp disagreement, Sabinus persuaded Cotta, who supported staying and fortifying camp, to march out. The Roman army left the next morning, and was soon ambushed and massacred by the Eburones.

Ambiorix' victory inspired further revolts. The Nervii attacked the winter camp of the legion led by Quintus Cicero (the brother of Marcus Tullius Cicero the orator). Cicero fortified his camp, and managed to get a message to Caesar, who personally led a Roman contingent to relieve the siege. This news caused the Treveri to forestall their attack on Labienus' camp. Caesar decided to consolidate Roman forces into three camps instead of five for the remainder of the winter.

For the campaigns of 53 BCE, Caesar correctly suspected that the previous year's unrest would continue. His immediate goal was the capture of Ambiorix, who had formed an alliance with a number of Gallic and German peoples. Unable to accomplish this, he placed greater pressure on Gallic resources.

Consequently, many Gallic peoples united, led by Vercingetorix, a prince of the Arverni, a people in southern Gaul. Vercingetorix used Roman-style discipline and diplomacy to keep his supporters in line, and was a talented strategist. But realizing that the Gauls were too weak to oppose the Romans in open battle, Vercingetorix focused on a strategy of attrition.

The first major encounter in this campaign was the siege of Avaricum, a Gallic stronghold. Despite strong initial resistance, the Gauls yielded, and were slaughtered as they attempted to flee. Caesar then proceeded to Gergovia, the well-fortified primary town of the Arverni. The Romans managed by stratagem to take Gallic camps surrounding the town. However, the army advanced into Gergovia too eagerly and was driven back.

The defeat inspired the Aedui and other Gallic peoples to join Vercingetorix, who began to fortify the hill town Alesia. Caesar began a circumvallation, which Vercingetorix' cavalry attacked before its

completion. Caesar therefore constructed a second wall with defenses designed to slow advancing enemies. The Romans drove back several coordinated assaults, with a final rout that left few Gallic survivors. Vercingetorix was forced to surrender. This was the last serious resistance of the war.

The remaining narrative of the Gallic Wars is authored by Aulus Hirtius, one of Caesar's officers. Caesar remained in Gaul for another two campaigning seasons. The last significant actions of this war were the siege of Uxellodunum and the subduing of Commius, leader of the Atrebates. But during this period, Caesar's opponents gained political momentum and finally were able to declare him a public enemy. In response, soon after January 1, 49, Caesar crossed the Rubicon and marched on Rome, beginning the Caesarian-Pompeian civil war (49–45 BCE).

Gallic Wars, Consequences

Caesar's *Gallic Wars* provides a lucid and fast-moving narrative. It is extremely valuable for study of Roman diplomacy, the Roman army, and engineering. It is also an important source for the classical ethnography (description of peoples) of preconquest Gaul, Germany, and Britain. However, recent scholarship has drawn attention to distortions in his work. For example, Caesar presents the Gauls and Germans as unreliable and treacherous, continuing an old tradition of Roman hostility to the Gauls. He also omits any less than creditable motives he might have for the conquest of Gaul.

After the Gallic Wars, Caesar's legions were loyal and highly experienced. The bond Caesar developed with his troops was significant and served as a model for many subsequent Roman military commanders. Though the nature of Caesar's authorship casts doubt on the enthusiasm of his army's response, there is plenty of confirmatory evidence that soldiers in this period were more loyal to their personal leaders than to the formal institutions of the Republic.

Other factors contributed to Caesar's army's loyalty, such as generous rewards and pay. Army size and campaign length may have weakened the common identity that Caesar's leadership methods were intended to foster. His armies mutinied in 49 and 47 due to supply shortages and dissatisfaction with pay and rewards. His soldiers recognized their own interests, as well as the political value of their support, and were willing to use these to their own benefit.

This pattern continued after Caesar's death: as Caesar's heir, Octavian was able to call up Caesarian veterans. Antony, as one of Caesar's former legates, used this connection to recruit his veterans. The oligarchic opposition did not have this advantage and had to rely on new recruits from the eastern Mediterranean, as did Antony after his break with Octavian.

The immediate consequences of the Gallic Wars for many of the Gallic peoples were undoubtedly disastrous. Even if the Romans had not inflicted massacre outright (as at Alesia), they enslaved many Gauls, reducing the native labor supply. Roman logistic demands likely also reduced food and supplies for the native population.

Some Gauls did benefit from the Roman conquest. These Gauls were recruited into the Roman army as non-Roman troops; Caesar was the first

to do this on a large scale, creating Legio V Alaudae (“Larks”) from Gauls and numerous cavalry cohorts from Gauls and Germans. Such recruitment led the way for the permanent establishment of the *auxilia*, military units recruited from noncitizens. These units were smaller, more flexible, and less expensive (auxiliary soldiers were paid slightly less) than legions.

Gaul eventually prospered from Roman colonization and especially from the trade promoted by Roman presence along the Rhine frontier. Local aristocrats who assimilated to Roman ways might receive positions in local government, which both promoted stability and provided needed support for Roman rule. Some reached high status, and Gauls became members of the Roman Senate by the mid-first century CE. Gallo-Roman aristocrats reached their high point in the fourth and fifth centuries CE, as the center of gravity of the western empire shifted northward to Milan and Trier.

Gallienus (Emperor) (260–268 CE)

A Roman emperor (260–268 CE), Publius Licinius Egnatius Gallienus was born ca. 213 CE, the son of the senator Publius Licinius Valerianus (Valerian) and his wife Egnatia Mariniana. They were a traditional senatorial family, with links to the central Italian region of Etruria. When Valerian became emperor in 253 CE, he promoted Gallienus to the rank of Augustus, effectively making him coruler. Between 254 and 256 CE, Gallienus campaigned in the Danubian and Balkan regions before moving to the

Rhine frontier between 257 and 259 CE. His father Valerian was based in the east, preparing for a war against the Persians. Although there was no formal territorial division, the system of co-emperorship allowed Valerian to deal effectively with threats on several different fronts.

Gallienus married Cornelia Salonina prior to his accession, and she bore him three sons, Valerian II, Saloninus, and Marinianus. This enabled the further division of responsibility between members of the imperial family. Valerian II was given the title of Caesar in 255 CE, and replaced his father on the Danube in 256 CE. When Valerian II died in 258 CE, Saloninus was elevated to Caesar in his place, and joined Gallienus on the Rhine frontier. Disaster struck in 260 CE, however, when Valerian was captured by the Persian king Shapur. This sparked a series of revolts by governors and commanders throughout the empire, including Ingenuus and Regalianus on the Danube, and Postumus in Germany. Saloninus was murdered in the latter uprising, which resulted in the defection of the provinces of Gaul, Spain, and Britain from the empire.

As a result of these events, Gallienus was left as sole ruler of the central provinces of the empire, as his conventional reign dates (260–268) show. The Palmyrene king Odenathus appears to have exercised some authority in Gallienus' name over the eastern regions, but the extent of his powers is debated. The revolts continued in the east until 262 CE, with insurrections by the financial official Fulvius Macrianus and the governor of Egypt, Aemilianus. In response to this dire situation, Gallienus reformed the military hierarchy. He ceased appointing senators to the post of legionary commander, instead replacing them with officers who had worked their way up from the ranks. Many of these commanders had begun their career as protectors, a new officer corps established by Valerian and Gallienus in the 250s CE. Gallienus' new nonsenatorial generals played pivotal roles in defending the Balkan provinces from incursions by the Goths and Heruli in 267–268 CE. Attempts to reclaim the Gallic provinces from Postumus were, however, unsuccessful.

Gallienus was murdered at Milan in 268 CE as a result of a conspiracy by several of his leading officers, which included the future emperors Aurelian and Claudius II Gothicus. He was unpopular with the Senate as a result of his military reforms, and the senators wanted to condemn his memory and put his brother and youngest son, Marinianus, to death.

Gallienus did not fare well in the Latin and Greek historical record. The

epitomators Eutropius and Aurelius Victor, the emperor Julian (361–363) in his *Caesars*, and the *Historia Augusta* blame Gallienus for the crisis and depict him as frivolous and unreliable. All that can be said is that Gallienus failed to retain the loyalty of his generals. Despite the hostility of the ancient sources toward his regime, Gallienus' overhaul of the army command structure marked a pivotal turning point in Roman history.

Gaul, Gauls

Roman interaction with the Gauls began in the early Republic with the Senones' invasion of Roman territory and sack of Rome; as the Roman conquest of Italy progressed, the Romans subdued and colonized the northern part of Italy known as Cisalpine Gaul. Continental Gaul, occupying roughly the area of modern France and Belgium, was added to Roman territory in the late Republic. The Romans first acquired the region of modern southern France (called at first the Province or Transalpine Gaul, later *Narbonensis*). Northern Gaul, which Julius Caesar describes as divided into three parts, Aquitania, *Lugdunensis*, and *Belgica*, was conquered by Caesar in 58–50 BCE. During the Republic, the Gauls remained an alien people, embodying the stereotype of the hated and feared “barbarian,” but as Gauls became assimilated Roman citizens, this role was filled by the Germans.

The Gallic peoples who settled in North Italy in the fifth/fourth centuries BCE were the Boii, Cenomani, Insubres, Lingones, and Senones. The similar Veneti and Raeti also settled in north Italy. They migrated from

continental Gaul across the Alps into the Po valley, which became termed Cisalpine Gaul.

The Senones proceeded as far as the Allia River, where they inflicted a serious defeat on the Romans. The Gauls advanced to Rome and sacked it in 390 BCE. According to Roman legend, the Gallic leader (the) Brennus demanded 1,000 pounds of gold but was forced to abandon his demands and flee when the Roman general Marcus Furius Camillus arrived with an army and drove off the Gauls. In fact, the Gallic sack was probably more humiliating for the Romans. The Romans developed a fear of the Gauls (*metus Gallicus*), and the prospect of a Gallic invasion justified a *tumultus* (a *levée en masse* or mass conscription, including propertyless citizens).

Nonetheless, as the Roman conquest of Italy advanced, some Cisalpine Gauls served as Roman allies; the Senones, however, allied with the Etruscans, Umbrians, and Samnites against Rome at the battle of Sentinum (295 BCE) and were defeated. The Romans thence advanced into Cisalpine Gaul and planted colonies to establish a Roman presence and intimidate the Gauls. The early colonies of Cremona and Placentia were overrun by the Gauls, but over time the Roman presence grew. In the decades just before the Second Punic War (218–201 BCE) the Romans defeated a coalition of the Senones and Etruscans and another union of the Boii and Insubres; Marcus Claudius Marcellus was among the Roman commanders victorious over the Gauls. In the Second Punic War, the Boii and Insubres allied with Hannibal.

In the early 120s, the Romans acquired Transalpine Gaul as a province, termed “The Province,” to protect the land route to Spain. Now the threat consisted of the German Cimbri and Teutones, who first invaded Transalpine Gaul in the late second century BCE, defeating a Roman army of 80,000 men at Arausio in 105. The Germans became the feared and hated barbarian.

After the Social War of 91–87 BCE Cisalpine Gaul became a Roman province; noncitizen settlers in colonies were enfranchised, and the other inhabitants of the province were granted Latin rights. After 42 BCE Cisalpine Gaul was merged with Italy, adding four new districts. Cisalpine Gaul was rapidly Romanized, but remained a strong recruiting ground for the legions in the late first century BCE and the early first century CE.

Continental Gallic society is described in Caesar’s *Gallic Wars* and (with more local color) by Greek ethnographers. Caesar depicts an agricultural, male-dominated society with many tribes (*civitates*) with aristocratic elites;

a few *civitates* elected magistrates in more Mediterranean fashion. The Gauls also had a priestly elite, the Druids, who monopolized learning and religious lore. The Gauls' Late Iron Age culture is known to archaeologists as La Tène from its style. In the 50s, the Gauls were already influenced by Mediterranean trade and culture, as Caesar notes. Each *civitas* (sg.) had a central settlement (termed *oppida*, "forts," by Caesar) but was otherwise dispersed in the countryside rather than urban.

Roman Gaul was marked by two major revolts, one in 21 CE, the more significant one in 69–70 CE, triggered by the partial withdrawal of Roman legions from the Rhineland as the legions supporting the emperor Vitellius marched south to civil war. The Gallic leaders of the revolt were auxiliary veterans, Julius Classicus and Julius Tutor, allying with the Batavian leader Julius Civilis. Their names suggest that their ancestors acquired Roman citizenship in the period of Julius Caesar or Augustus. Our main account of the revolt, Tacitus' *Histories*, depicts the persistence of native identity and resistance to Rome. However, Rome soon quelled the revolt.

The Gauls of the imperial period became partially assimilated to Roman culture. This happened quickly in Cisalpine Gaul, which became indistinguishable from the rest of Italy and was a major recruiting ground for the early imperial legions, and in Gallia Narbonensis, where the local elites were granted Roman citizenship and advanced in the imperial administration. Northern Gaul took longer to be fully assimilated. In a famous speech (preserved also in an inscription), the emperor Claudius I (41–54 CE) defended the promotion of Gallic elites into the Senate. A fusion of cultures took place, often termed Gallo-Roman. Many Gallo-Roman aristocrats became highly proficient in Latin literature and rhetoric, especially in late antiquity. Many Latin place-names have persisted into modern times in French form; the French language evolved from Vulgar Latin (as spoken in Gaul) but was not standardized until the seventeenth century.

In the mid-third century, as the central power was weakened by invasions, coups, and revolts, Roman Gaul became practically a separate empire, with its own emperor Postumus (and shortlived successors). The "Gallic Empire" was reconquered by Claudius II Gothicus (268–270) and Aurelian (270–275). After that time unrest took the form chiefly of brigandage, the Bagaudae of the late third and fourth centuries. Diocletian (284–305) elevated Maximian to co-emperor to fight the Bagaudae.

The First and Second Tetrarchy and Constantine the Great (306–337) maintained provincial capitals throughout the empire to maintain an imperial presence and discourage separatism. The provincial capitals in the western empire were at York in Britain, at Trier in northeast Gaul, and at Milan. Trier (Augusta Treverorum) was one of Constantine’s favorite capitals before his founding of Constantinople and was adorned with impressive buildings.

Fourth-century Roman Gaul was prosperous, but the fortunes of fifth-century Gaul went sharply downhill due to the invasions of the Burgundians, Visigoths, and Franks. The loss of Gaul to the western empire seriously weakened its finances, contributing to the collapse of the western Roman Empire (476). The Visigoths dominated Gaul until the late fifth century CE, when they were displaced by the Franks.

Gender and War

The term “gender” encompasses both the actual social roles of men and women and the cultural or ideological construction of masculinity and femininity in a given society. Both actual roles and cultural constructs influence one another and may change considerably over time. “War” for the purposes of this article includes active war, low-intensity conflict, and military organizations. War and gender interact because across nearly all primitive and historical cultures, warfare was considered a masculine activity; warriors and soldiers were male, and manhood was associated with fighting. Though individual female fighters existed in some of these societies, they were exceptional until very recently, when the professional

militaries of Western nations accepted women as soldiers; even then, women have often been excluded from the front lines.

In the Roman world, warfare was a male prerogative, closely associated with masculinity. Women did not serve as soldiers in the Roman army. As will be seen, the presence of women in military society was symbolic or marginal before the imperial period. A few legendary exceptions exist, such as Cloelia, who saved early Rome by escaping from captivity and swimming a river to warn the Romans (Livy 2.13). Cloelia received an equestrian statue in her honor, which Livy depicts as altogether exceptional, as is the equally legendary Camilla, a Volscian female warrior who aided Turnus in his war against Aeneas and the Trojans (Virgil *Aeneid* 11.1121–1210).

Historical exception was made for siege warfare, where women often aided the defense of their cities. Women were motivated to defend their besieged cities because the enemy, sacking the city, would rape and enslave the women. During the civil war of Caesar and Pompey, Caesar (*Civil War* 3.9) relates that at Salona, a city on the coast of Dalmatia (modern Croatia), the female citizens appeared on the walls disguised as male fighters so their menfolk could make a sortie from the walls and drive off the besieging Pompeians. In a less reliable anecdote (repeated elsewhere, for example, Appian, *Punic Wars* 93), the women of Salona cut off their hair (a feminine attribute in classical culture) to make catapult torsion ropes. In the triumviral civil wars (ca. 44–31 BCE), the Roman noblewoman Fulvia and her brother-in-law Lucius Antonius commanded the defense of Perugia, an Italian city besieged by Octavian. In Plutarch's view, Fulvia was a particularly strong personality. Found at the site of Perugia, lead sling bullets were inscribed with soldiers' Latin words instructing the bullets to "rape" Fulvia, Octavian, and Antonius.

The Romans associated warfare and military service with *virtus* (courage, the quality of being a *vir*, "a [true] man"). Military training, military discipline, and a rigorous lifestyle on campaign all maintained *virtus*. The life of pleasure was thought to make men effeminate. Accordingly, exemplary commanders expelled luxuries (including lavish food and drink and dinnerware, personal servants, and prostitutes and entertainers) from military camps.

A darker side to military *virtus* concerns the ideological place of women in Roman military culture, as represented in classical literature and art. The personification of Victory (Victoria) eroticized victory, being depicted as a

winged female deity influenced by representations of Aphrodite (Venus), the goddess of love (Dillon and Welch 2006). In contrast, defeat was also gendered: on Roman historical reliefs, from imperial monuments to provincial art, defeated non-Roman peoples are often depicted as female captives, grieving and in chains. Male barbarians are in a similar state, often depicted as captive or as being killed. Defeat meant enslavement and the reduction of the enemy to “female” status through subjection and rape (Phang 2004).

Triumphal art could even depict Roman military conquest as the rape of female personifications or representative captives. In a famous relief from the Sebasteion (temple of the imperial cult) at Aphrodisias in Asia Minor, the emperor Claudius (41–54 CE) is depicted as a heroic male nude overpowering a female personification of Britannia (Britain). The Column of Marcus Aurelius (completed by Commodus) depicts both a Venus-like Victory and Roman soldiers dragging away captive German women by the hair or even killing them. The enslavement of German women and their children symbolizes the destruction of German society and thus the complete victory of the Romans in the Marcomannic Wars (Ferris 2009).

That soldiers, like tyrants, are unable to restrain their desires was a stock theme in late republican and imperial literary authors. It was used by rebels against the Roman Empire to justify revolt. The British revolt of 60/61 CE was motivated by Roman soldiers’ beating and rape of native British noblewomen (the queen Boudicca and her daughters). Jewish rabbinical sources also assume that Roman soldiers who entered a Jewish settlement would sexually molest the women.

In contrast, the Romans regarded the female leaders and warriors of non-Roman peoples with fear and hostility. Octavian’s propaganda against Mark Antony and Cleopatra depicted Antony as enslaved by love of Cleopatra and Cleopatra as an alien “Oriental” queen who would dominate and subjugate all Roman men. A similar scare figure is Boudicca, the British tribal queen in Cassius Dio’s account of the British revolt of 60/61 CE. In this ideology, warrior queens were particularly un-Roman; they represented monarchy, to which the traditional Republic was antithetical. The representation of barbarian peoples’ individual female fighters belong to the same discourse (Iberians, Appian, *Spanish Wars* 12; Germans, Plutarch, *Marius* 19.7, 27.2).

The actual place of women in Roman military society is harder to study;

due to the masculine gendering of warfare, women merit only brief mentions, if at all. During the Republic, the legions were often on the move. During the Italian Wars, Roman commanders and soldiers left their families behind in Rome and Italy. Women and children probably tended the farms owned by legionary smallholders (*assidui*). These practices were strained by the longer term overseas campaigns of the Punic and Macedonian Wars onward. Some farming families may have lost their land. Meanwhile, soldiers on campaign resorted to the prostitutes and other camp followers (including personal slaves) whom martinets ejected. The Roman legions fleeing the Varian disaster (9 CE) were hampered by excessive baggage and the presence of women and children.

The stabilization of the frontiers after 14 CE enabled substantial civilian settlements to develop around military bases. The camps themselves were no longer tents, as in the traditional Republic, but solid buildings. Archaeological evidence suggests the presence of women and children within military camps, depending on the association of “female” gendered objects (dress brooches, combs, and perfume bottles) with the presence of women.

Within camps, officers were allotted dwelling space according to their rank. Such space offered room for servants or families. Elite officers could bring families to their posts, though in the early first century CE it was still unusual. Agrippina the Elder, her children, and female friends and servants accompanied Germanicus to his post quelling the Rhine mutiny in 14 CE. Tacitus provides more context by relating a debate in the Senate (Tacitus, *Annals* 3.33–4) over whether the wives of provincial governors should accompany them to their provinces.

In Tacitus’ *Annals*, this passage is closely tied to political events. Agrippina greeted the troops in Germanicus’ name when they returned from an advance across the Rhine into barbarian territory. Agrippina’s behavior scandalized Tiberius and excited his paranoid fears that she (as well as her husband) was an imperial rival (Tacitus, *Annals* 1.69). When Germanicus died of alleged poisoning, Tiberius implicated the governor of Syria, Gnaeus Piso, and his wife Plancina, whom he also depicts as interfering with the army (Tacitus, *Annals* 2.55).

Though Tacitus depicts empresses and aristocratic women as subverting political stability, the emperors might promote their wives’ images on coins (which the army received as donatives and pay). The wives of Antoninus

Pius and Marcus Aurelius, Faustina the Elder and her daughter Faustina the Younger, appear on these reigns' coins. Faustina the Younger, furthermore, received the title *mater castrorum* or "mother of the camps," a title that the Severan empresses also used. The image of the empress suggested the stability of the regime. The slogan "mother of the camps" was probably intended to reinforce soldiers' loyalty to the imperial house. Another symbolic role for imperial women in a military context was the birthdays of empresses and other members of the imperial family, celebrated by the army at least at Dura-Europos in Syria, attested in the military calendar termed the *Feriale Duranum*.

Outside the pages of Tacitus, it became usual for governors and elite officers to bring their wives and families to their posts, attested in inscriptions and even documents such as the letter from one officer's wife to another, surviving from Vindolanda near Hadrian's wall. This letter, a birthday party invitation, suggests the role of officers' wives in maintaining social ties. At provincial bases, officers' families tended to intermarry. Common soldiers were denied legal marriage between ca. 13 BCE and 197 CE, when Septimius Severus permitted them to marry, but many soldiers formed stable de facto marriages with women and raised children (who were technically illegitimate). The legal position of soldiers' families was precarious, illustrating the impact of gender ideology on social practice.

Germanic Wars, Causes

Migration, nascent state formation, and perceptions of insult sparked these conflicts. The initial invasion of Cimbri, Teutones, and Ambrones resulted from a population increase and/or a shift in climate in northern Europe decreasing usable land. If we allow for Roman exaggeration, Plutarch (*Marius* 11) depicts some 300,000 armed warriors and huge numbers of their wives and children outnumbering the men, seeking land and towns for habitation: their entry was a population migration, not simply a raid.

Over the first century BCE, the Celtic inhabitants of Southern Germany as well as Germanic groups such as the Tencteri, Usipetes, and Ubii began to suffer displacement by the Suebi migrating from the east, who soon dominated Germany east of the Rhine (Strabo 4.3.4). The Suebi's political organization made them attractive allies: Celtic tribes invited them into Gaul to fight the Aedui, who were allies with Julius Caesar and the Romans (Caesar, *Gallic Wars* books 4 and 6; Tacitus, *Germania* 8).

Exact causes of the German provocation in 16 BCE involving the Tencteri, Usipetes, and Sicambri are unknown. Cassius Dio (54.20.4) states that their seizure and crucifixion of an unspecified number of Romans led to the attempt of Marcus Lollius to avenge this slight. After Lollius was defeated and his standards stolen, the Romans embarked on campaigns against the Germans led for four years by Drusus the Elder (Velleius 2.97), followed by Tiberius' campaign against Germania in 8 BCE. These were incursions, not long-term subjugations or conquests. Campaigning in Germany was crucial vis-à-vis the pacification of Gaul, unruly in response to a census (Dio 54.32.1, [Livy] *Periochae* 139).

Germanic state formation and Roman response to it also illuminates the causation of the near-war against the Marcomannic king Maroboduus. By 5 CE, the Marcomanni possessed a palace, a fortress, and a huge, welltrained multiethnic army. Maroboduus attracted and gave refuge to both "races and individuals who revolted" from Roman rule (Velleius 2.109), suggesting widespread anti-Roman sentiment and an ability to integrate non-Marcomanni into his nascent Germanic state.

A theme of Roman abuse occurs through several outbreaks of Romano-Germanic conflict of the following period. Sources trace the disaster at Teutoburg Forest in 9 CE to Varus mistreating Germanic peoples (Dio 56.18.3–4). Arminius' coalition there resembled those of Vercingetorix,

Ariovistus, and Maroboduus. The briefness of Arminius' Teutoburg success, his failure to follow up on it, and his assassination in 21 CE by his tribal brethren explain the difficulties of organizing a state from tribes reluctant to discard older freedoms. In the case of the Germanic Frisii in the Netherlands in 28/29 CE, sources show the revolt responding to harsh Roman taxation including seizures of Frisian livestock, land, wives, and children (Tacitus, *Annals* 4.72). The final significant Romano-German conflict of this period stemmed from the Batavian leader Gaius Julius Civilis' irritation at being arrested for treason twice, grew when Batavi were required to provide a disproportionate number of soldiers for Rome's auxiliary armies and when Galba dismissed his German bodyguard further insulted the Batavian nation (Tacitus, *Histories* 4.13ff).

The "Empire of the Gauls," a coalition of Germanic and Gallic tribes, combined causative themes from previous conflicts: Germanic perceptions of Roman insult, as was the case with the Frisians in 28 CE and the Varian Disaster, and a Germanic chieftain with Roman citizenship who seemingly sought his own power-base, as with Arminius. A new factor, however, is deep friction between Roman legionaries and Germanic auxiliaries. This would prove a precedent for future discord in the coming centuries.

Germanic Wars, Course

Violent conflicts occurred intermittently between the Romans and several Germanic peoples from the late second century BCE to the first century CE, beginning with the invasion of the Cimbri, Ambrones, and Teutones in the late second century BCE. They attacked Roman territory in Transalpine Gaul repeatedly between 113 and 105, defeating a Roman army of some 80,000 men in 105 at Arausio (Orange), the worst Roman disaster since Cannae. In 102–101 BC, Marius' army defeated the Cimbri and Teutones in two battles, Aquae Sextiae (Aix-en-Provence) and Vercellae (Plutarch, *Marius* 27).

After a gap, in 58 Julius Caesar's six legions defeated the Suebi led by King Ariovistus at Vosges in Alsace (Caesar, *Gallie Wars* 1.43). The Suebi then turned back across the Rhine to Germania. However, German groups inhabiting both sides of the Rhine frequently assisted Gauls against Rome in the 30s and 20s BCE.

Conflicts resumed in 16 BCE with the crucifixion of several Romans by Tencteri, Usipetes, and Sicambri, leading to Roman raids on Germania and Gaul, a defeat of the Roman consul Lollius, and the capture of the Fifth Legion's eagle (Dio 54.20.4–5; Velleius 2.97.1). Drusus the Elder then attacked the Chauci, Usipetes, and Cherusci, and then the Sicambri and Suebi at the River Lupia (Lippe) in 11 BCE (Dio 54.32–33), then defeated the Marcomanni in 9 BCE. The future emperor Tiberius subsequently began a thorough campaign in parts of Germania starting in 8 BCE. In 5 CE, Tiberius campaigned in Germania (Velleius 2.106) and planned to attack the Marcomannic chief Maroboduus and his huge army trained in the Roman style (Velleius 2.109.2), but the Romans allied with Maroboduus for the duration of Rome's war against Pannonia. In Germania beyond the Rhine, the Romans succeeded in pushing the frontier up to the Elbe, its furthest extent.

Around this point, Dio (56.18.1–3) claims that the Germans' partial Romanization and urbanization might have led to Germania becoming a Roman province. However, in 9 CE occurred the Varian disaster in the Teutoburg Forest. Germans led by Arminius, a Cheruscan noble, auxiliary veteran, and Roman citizen, lulled the legate Varus into trusting them, and ambushed and destroyed three Roman legions and auxiliaries—some 20,000 men (Dio 56.19–22; Velleius 2.117–119). As a result of this terrible defeat, in 14 CE Augustus issued a posthumous directive to Tiberius not to extend

further the boundaries of the empire.

Vengeance was still necessary. Tiberius, and subsequently Germanicus in 14–16 CE, mounted punitive expeditions into Germania. Germanicus defeated Arminius at the battle of Idistaviso in 16. This partly avenged the Teutoburg and Lollian disasters, but did little to extend Roman rule. The Romans abandoned the territory between the Rhine and the Elbe.

From this point, “Germania” must be divided into Roman territory (the Rhineland, organized by the time of Vespasian into two small provinces, Germania Superior and Germania Inferior) and “free” Germany beyond the Rhine. In the first century CE, the Romans built many forts along the Rhine and promoted urbanization. Claudius elevated Trier and perhaps Cologne to *colonia* status. Although local elites received Roman citizenship, nonelite acculturation to Roman values and culture was limited. The most important revolt occurred in 69–70 CE. The Batavi, a Germanic people dwelling at the mouth of the Rhine, joined by several other Germanic groups and by the Gauls, revolted under their chief Gaius Julius Civilis, an auxiliary veteran and Roman citizen, resulting in a brief Gallic Empire before defeat in spring 70.

In the Flavian period and early second century, the Romans advanced the German frontier from Germania Superior (the southern province) beyond the Rhine. Domitian (81–96) inflicted defeats on the Chatti and may have begun the construction of frontier works, but was distracted by the Dacian invasion. Trajan and Hadrian constructed a *limes* or frontier installation, consisting of a road and line of forts (later a palisade) eastward of the Rhine that modern archaeologists term the Odenwald-Neckar *limes*. It encloses the western part of Baden-Württemberg, covering the Black Forest and Jura. The region enclosed by the *limes* was termed the *Agri Decumates* (Tacitus, *Germania* 29.4). Its purpose was to shorten the Roman frontier between Germania Superior and Raetia by enclosing a salient. But the *Agri Decumates* were overrun by the Germans in the mid-third century.

In the fourth century CE, from the 350s onward, the emperors constantly fought incursions of Germanic peoples across the Rhine, especially the Alamanni, Suebi, and Juthungi. Constantius II (337–361) raised his cousin Julian to Caesar to combat the Alamanni. Julian inflicted a major defeat on the Alamanni at Strasbourg in 357; because of his victory, he was acclaimed as emperor by his troops, and though he then refused, he did not refuse when they did the same at Paris in 361. Valentinian I (364–375) also fought

the Germans. However, civil war distracted the Romans in the 380s–390s, and after 400 the Germanic peoples poured across the Rhine, taking advantage of the river’s freezing in 407. This time the Romans were unable to expel them.

Germanic Wars, Consequences

Several significant short- and long-term consequences resulted from these wars. Marius’ campaigns against the Cimbri and Teutones in the late second century BCE resulted in changes in Roman military organization and produced key political aftereffects. Rome’s victories over the Germans made them fear the Germans less despite their perception of German alienness. Many German peoples themselves, through trade relations with urbanized peoples, increasingly adopted elements of Mediterranean material culture. The Roman borders stabilized as a defensible line along the Rhine. However, the failure to conquer Germany east of the Rhine allowed the German population outside of Roman control to increase. This development would ultimately be fatal to the western empire.

The invasion of Cimbri and Teutones in the late second century BCE panicked Romans so severely that after the disaster at Arausio in 105 BCE, the Roman people illegally gave Gaius Marius command against these groups. This strengthened a precedent for the popular bestowal of commands outside of republican norms, and surely encouraged elite expectations for

extraordinary commands in the final century of the Republic. Another direct response to this invasion was a reorganization of the Roman legions. Before the battle of Arausio, Marius had already abolished the property qualification for military service. After Arausio, Publius Rutilius Rufus reformed some aspects of Roman legionary training and organization to better fight the Germans. Marius' victories using this formation in 102–101 BC against the Germans caused him to be regarded as Rome's "third founder," enjoying offerings of food and wine alongside those given to the gods at family gatherings (Plutarch, *Marius* 27), a significant precedent in the evolution of emperor worship. Cimbrian invasion fostered sharp contention between Marius and Sulla, bringing on Rome's first civil war and setting a precedent for future marches on Rome and Rome's bloody proscriptions by the likes of Octavian. Finally, Marius made his Italian troops into Roman citizens, encouraging Italians to desire more input into Roman foreign policy, which would bring on the Social War (91–87 BCE).

This series of victories, along with further victories in the first centuries BCE and CE, allowed the Romans overcome some of their fear of the Germans as described by Plutarch (*Marius* 16) and in Tacitus' ethnography *Germania*. Roman soldiers of the Augustan period became accustomed to the Germans' fierce battle cries, huge physiques, nakedness, and other fearsome features. Subsequently, it is likely that the Germans that Romans most often encountered were assimilated Germans serving in the *auxilia*, where they were organized, dressed, equipped, and trained in Roman fashion.

Consequences for the Germans deserve examination. Germans in areas near Roman borders adopted Roman ways and economic practices (Tacitus, *Germania* 5). Romans introduced not only garrisons and forts along the Rhine but also villas and towns, which undoubtedly modeled forms of resource-extraction technology more efficient than those the Germans practiced. The primitive economy that characterized many Germanic tribes, reliant on spoils from raiding and which featured little banking, interest, finance, or private ownership of land (Tacitus, *Germania* 26) grew into more complex systems featuring trade with people influenced by Mediterranean economies and cultures. Roman trade goods and coins have been found deep within "barbarian" Germany. A cosmopolitan Roman influence is visible in local architectural forms, such as the change in a villa at Megina from wattle-and-daub construction to stone foundations and walls supported by posts, and finally even a colonnade. However, the adoption of

Roman architectural features was never total, and pre-Roman regional styles still prevailed in Germania.

Another consequence for the Romans was a more realistic limit to Roman control over Germania east of the Rhine resulting from Germania's impenetrability, the numerousness of German tribes, their lack of interest in being governed by Rome, and a general lack of benefits compared to the costs of occupation. For even the most privileged of the Germans who received Roman citizenship led revolts against Roman rule. The Rhine came to seem a sensible border, as Rhine shipping made supply easy. Between the Varian debacle of 9 CE and the Trajanic era, the Rhine held more Roman forts and garrisons than any other similarly-sized place along the Roman frontier. Romans were thus able to retain control of the west bank of the Rhine until the early fifth century CE, and even controlled a segment of the east bank (the *Agri Decumates*) until the mid-third century. Cities of the Rhineland, such as Augusta Treverorum, enjoyed economic success stemming probably from production of agricultural products and other goods sold to the army. These cities began to transform from *civitates* into *municipia* in the Flavian period. After giving up the ambition of direct rule over the area east of the Rhine, the Romans could sponsor indirect rule via client kings in Germania, using deterrence, Roman education, gifts, and imperial honors.

Although prudent from the perspective of Roman administration in the considerations of the first century CE, relinquishing Germania east of the Rhine held a grievous demographic consequence for the future. It meant that Germanic societies there were able to retain more or less their own cultural forms and political arrangements, but with the advantage of using Roman resource-extraction technology without supervision, admonition, or frequent checks or controls by Roman administrators. This allowed Germanic groups outside of Roman territory to increase without observation, providing a constant threat in the Antonine Period and beyond, and eventually contributing to the fall of the western Roman Empire.

Germanicus (16/15 BCE–19 CE)

Germanicus was the nephew of the emperor Tiberius (14–37 CE), the father of the future emperor Gaius (37–41) and empress Agrippina the Younger, and the brother of the future emperor Claudius (41–54). A potential heir of Tiberius, he was promoted rapidly as a general and was assigned to suppress the 14 CE Rhine mutiny and commanded the campaign against Arminius. However, Germanicus’ subsequent conduct in the eastern empire aroused the jealousy both of a rival governor and of Tiberius, and he perished under mysterious circumstances resulting in a major political trial, recorded both in Tacitus’ *Annals* and in a surviving decree of the Senate.

Germanicus was the son of Drusus the Elder, the younger brother of Tiberius, and Antonia. He was adopted in 4 CE by Tiberius (not yet emperor) and renamed Germanicus Iulius Caesar. As a prince of the imperial family, Germanicus was promoted rapidly to military commands and held the consulship in 13 CE. Though Tiberius had a son, Drusus the Younger, the more popular Germanicus appeared to be his probable successor.

In 14, after the death of Augustus, the Rhine and Danube legions mutinied over their conditions of service, which included relatively low pay (reduced by deductions for arms and armor and other necessities: Tacitus, *Annals* 1.17) and lengthy service. Germanicus was sent to the Rhineland to suppress the mutiny. Still a young man, not yet 30, he faced hard-bitten soldiers and at first was unable to quell their demands. He was accompanied by his wife Agrippina the Elder, her attendants, and his children, whom he

now sent away for safety. Among his children was Gaius, a little boy termed Caligula ("Little Boots") because he wore a miniature soldier's costume. According to Tacitus' account of the mutiny, the soldiers repented at losing Agrippina and their mascot "Little Boots." Tacitus tends to stress the irrationality of crowds, depicting the repentant soldiers as joining in punishing the ringleaders of the mutiny. Tiberius made only slight concessions to the soldiers' demands.

Germanicus followed up with an aggressive campaign into Germany, intended to avenge the defeat of Quinctilius Varus and destruction of three legions in 9 CE. He reached the site of the Varian disaster in the Teutoburg Forest (near Kalkriese) and recovered the lost Roman standards. He campaigned against Arminius, defeating him in the battle of Idistaviso (16). According to Tacitus, these successes incurred the suspicion of the jealous Tiberius.

Tiberius then transferred Germanicus to the eastern empire on a tour of inspection. After visiting Asia Minor, Cappadocia, and Commagene, Germanicus entered Egypt. As the main source of grain for the empire, to discourage senatorial revolt, the province of Egypt was governed by an equestrian prefect; senators were not permitted to enter Egypt without imperial permission. By visiting Egypt, Germanicus further incurred Tiberius' anger and suspicion. Germanicus also made an enemy of Gnaeus Calpurnius Piso, the governor of Syria; allegedly, Tiberius and Livia encouraged Piso and his wife Plancina to be rude to Germanicus. On his return from Egypt, Germanicus fell ill at Antioch, issuing a directive to his subordinate to remove Piso from his governorship. Germanicus became worse and died (19 CE), allegedly from witchcraft (Tacitus, *Annals* 2.68–71). Piso attempted to recover control of Syria by suborning the army, an apparent revolt (Tacitus, *Annals* 2.76–81). Tacitus depicts Piso as previously currying the favor of the legions with donatives and favors (Tacitus, *Annals* 2.55). Piso was summoned to Rome for trial for sedition and murder. Agrippina the Elder brought home Germanicus' ashes to Rome from Brundisium, to great popular mourning for Germanicus, who had been highly popular in contrast with the grim Tiberius.

Gnaeus Calpurnius Piso was charged by the Senate with sedition and with conspiracy in the murder of Germanicus by poison or witchcraft. Plancina was exonerated, but Piso committed suicide before the trial commenced and was condemned *post mortem*. The verdict of the Senate is

recorded in the surviving *Senatus Consultum de Cn. Pisone Patre* (Piso was termed “pater” to distinguish himself from relatives with the same name). The *SC de Cn. Pisone* execrates Piso and condemns his memory; his portrait images and name in inscriptions were destroyed and his son Gnaeus Calpurnius Piso was required to change his name to Lucius.

Besides the *SC de Cn. Pisone patre* and other contemporary inscriptions, the main source for Germanicus’ life is Tacitus’ *Annals*. Tacitus uses Germanicus as a foil to the uncongenial Tiberius. Modern historians have sometimes viewed Germanicus less favorably, as a young man lacking in the political acumen that might have made him a true rival to Tiberius.

Germans

The Germans were among Rome’s most persistent enemies and as such, most persistently mythologized by ancient authors and modern nationalists. There was no such entity as modern Germany, but many different tribal peoples sharing cultural characteristics and thus characterized as “Germans.”

The Greeks did not differentiate strongly between Gauls and Germans, terming both groups “Celts” (*Keltoi*). In the *Gallic Wars* Julius Caesar distinguishes between Gauls and Germans, characterizing the Gauls as more exposed to Mediterranean civilization and as possessing more traits of civilization, such as permanent settlements. In contrast, Caesar’s Germans are nomadic and lack most of the traits of civilization. Tacitus’ treatise *Germania* provides a fuller description of the Germans, but one that is still

subject to generalization and idealization. The *Germania* is a literary text in which Tacitus gives the primitive Germans the virtues that present-day Romans lack. As such, the *Germania* has appealed to modern German nationalists. However, Caesar and Tacitus, and other ancient authors describe individual tribes: the Chatti, Suebi, and others. The Romans dealt with individual tribes rather than with the Germans as a whole. The invasion of the Cimbri and Teutones, who inflicted a major defeat on the Romans at Arausio and were routed by Gaius Marius, characterized the Germans as enemies of Rome.

Roman imperialism thrust into Germany as far as the Elbe and halted there after the Varian disaster (9 CE) when three legions, commanded by Publius Quinctilius Varus, were ambushed and destroyed by the German leader Arminius and his followers. Germanicus, the nephew of Tiberius, inflicted punitive raids in 15 and defeated Arminius in the battle of Idistaviso (16 CE), but Roman expansion into Germany did not resume. The region's large forests were impassable, and the Germans had the reputation of being relatively poor, not affording great plunder. Individual emperors carried out intermittent campaigns against the Germans, such as Domitian's against the Chatti in 82–83 and war against the Sarmatian-Suebi alliance. The Romans established a stable frontier by closing the frontier boundary between the Neckar and the Danube, a region termed the *Agri Decumates*, by creating *limes* works (not a permanent stone wall but a palisade).

The Germans became a greater threat to the Roman Empire from the mid-second century CE onward, when the Marcomanni and Quadi invaded the Danubian provinces in the 160s and were repelled by Marcus Aurelius, who campaigned in person against them. The Goths invaded the empire in the mid-third century, raiding through the Balkans and along the coast of Asia Minor, but were defeated or expelled. Low-intensity conflict against Germanic peoples on the Rhine and Danube became endemic. Germanic invasions became a major threat in the late fourth century, culminating in the battle of Adrianople (378), a major defeat for the Romans. In the early fifth century, Germanic peoples migrated into the empire on a large scale, their warriors serving as mercenary bands ("allies" or *foederati*) to which the emperors paid large subsidies. Eventually these bands and their leaders displaced the weakening central authority. Even before this time, many officers with Germanic names served in the Roman army; their allegiance appears to be entirely Roman.

During the first five centuries CE, the Germans themselves underwent cultural change from their contact with the Roman Empire. Defeated Germanic peoples who were allowed to settle in the Roman Empire (such as the Batavi and Ubii in the Rhineland) served in Rome's auxiliary forces, obtaining the Roman citizenship on discharge; service in the army was thus a strong force for Romanization. Trade also promoted cultural change. Roman coins, pottery, and arms and armor are found deep within Germany, indicating that traders penetrated into Germany and that the Germans sought both Mediterranean food and drink (such as wine, not produced in northern Europe) and Roman-style arms and armor. Within the empire, men's fashions changed, perhaps from Celtic or German influence or the influence of the Roman army (in modern times, the military inspired men's fashions such as the cravat, the Victorian frock coat, the trench coat, and other items). By the mid-third century CE, Roman men often wore tunics and trousers instead of togas; in earlier times, trousers had been considered a "barbarian" garment, worn by Persians, Gauls, and Germans. The most drastic cultural change among the Germans was their adoption of Christianity, often Arianism (a variant considered heretical by Roman Catholicism). Such assimilation of Roman cultural traits has caused modern scholars to refer to the fifth- to eighth-century Germanic kingdoms (Franks, Visigoths, Vandals, Lombards, et cetera) as "post-Roman" rather than "barbarian."

The study of the ancient Germans has historically been conditioned by modern German nationalism, which anachronistically presented the ancient Germans and in particular leaders such as Arminius as founders of the modern nation.

Gordian I (Emperor) (238 CE)

A Roman emperor (238 CE), Marcus Antonius Gordianus Sempronianus Romanus Africanus served as proconsul of Africa in 237/238 CE at the age of 80. In January 238 CE, he was hailed as emperor by provincials protesting against the harsh taxes being exacted by Maximinus I Thrax. Gordian sent an embassy to Rome to murder Maximinus' praetorian prefect, and his rule was officially recognized by the Senate. However, the governor of Numidia, Capelianus, remained loyal to Maximinus, and invaded the province of Africa. Gordian committed suicide by hanging himself, having reigned for only three weeks. These events are depicted in Herodian's *History of Rome*; the *Historia Augusta*'s life of the Three Gordians is unreliable.

Gordian II (Emperor) (238 CE)

A Roman emperor (238 CE), Marcus Antonius Gordianus Sempronianus Romanus Africanus was the son of the old Roman senator of the same

name, Gordian I. In 238 CE, the younger Gordian was serving as his father's legate in the province of Africa when a rebellion broke out against the emperor Maximinus. The rebels proclaimed the elder Gordian I emperor, and he subsequently made his son joint Augustus. However, the governor of Numidia, Capelianus, led an army into Africa in support of Maximinus' regime. After the suicide of his father, Gordian II took command of the resistance forces, but died in battle.

Gordian III (Emperor) (238–244 CE)

A Roman emperor (238–244 CE) and the grandson of Gordian I, Marcus Antonius Gordianus was aged thirteen when he became emperor in 238 CE. In 241 CE, Gordian III married Furia Tranquillina, the daughter of his Praetorian Prefect Timesitheus. The following year Gordian III and Timesitheus embarked on a campaign against the Persians, who had invaded the Roman province of Mesopotamia, and captured several cities including Nisibis and Hatra. However, the Roman forces were defeated in battle by the Persian king Shapur in early 244 CE, and Gordian was murdered by his own soldiers or assassinated by his new praetorian prefect, Philip Arabus, who became the emperor Philip (244–249). Gordian III was buried in a tumulus at Zaitha. The short reign of Gordian III is illustrative of the precarious position of boy emperors in the later Roman Empire, when emperors needed to be competent military leaders and were surrounded by ambitious generals.

Bust of Gordian III (238–244 CE). Thirteen years old when elevated, and faced with civil war and renewed Persian aggression, Gordian had to play the role of commander-in-chief. Gordian III wears a military cloak and the soldierly scowl introduced by Caracalla's portraits. Located in the Louvre Museum, Paris, France. (Vanni Archive/Art Resource, NY)

Goths

The Goths were a Germanic people who played a central role in the fall of the western Roman Empire in the late fourth and fifth centuries CE. Two Gothic states eventually emerged in western Europe in the fifth century: the Ostrogoths in Italy and the Visigoths in the Iberian peninsula and southern Gaul.

Originating in southern Scandinavia, the Goths first invaded the Roman Empire in the mid-third century CE, launching raids in the Balkans and Aegean by land and by sea. The emperor Decius (249–251) died in battle with the Goths, but the emperors Gallienus (260–268) or Claudius Gothicus (268–270) (who should have credit is uncertain) defeated the Goths in a major battle at Naissus (Nish in modern Serbia) and drove them back across the Danube. Rome maintained normal diplomatic relations with the Goths during the early fourth century, and Christian missionaries, most famously Ulfilas (Wulfila), made headway among the Goths. Ulfilas converted many of the Goths to Arianism, a branch of Christianity deviating from the Nicene Creed.

By the mid-fourth century CE, it becomes possible to differentiate two branches of the Goths, the Thervingi (later termed Visigoths) and the Greuthungi (later Ostrogoths). Both were pressured by the migration of the Huns into central Europe. The Ostrogoths, led by their king or chieftain Fritigern, sought sanctuary on the Roman side of the Danube, negotiating with the officers of the emperor Valens (364–378). Tens of thousands of Goths crossed the Danube. Ammianus Marcellinus relates how Valens' officers abused the Gothic refugees, enslaving them and selling them dogs' meat. The angered Goths overran the Balkans, raiding and destroying Roman settlements. Valens decided not to wait for his younger colleague Gratian to send reinforcements from the west, and encountered the Goths in battle at Adrianople in Thrace (August 9, 378). The Roman army was surrounded and cut to pieces. Valens died in the battle, along with two-thirds of the eastern empire's army.

The Thervingi (Visigoths) made peace with the Roman Empire in 391, being permitted to settle along the eastern Adriatic coast in return for

providing client military forces. The recruitment of such client peoples was emperor Theodosius I (379–395)’s stopgap solution to the loss of manpower at Adrianople. The leader or king of the Visigoths, Alaric, a former Roman officer, provided Gothic troops to Theodosius in his civil war against Arbogast and Eugenius. In the battle of the Frigidus (394) Theodosius allegedly stationed many of the Goths in the front lines of the battle so that more of them would be killed, reducing the barbarian population. In any case, Alaric regarded himself as insufficiently rewarded after Theodosius’ victory.

Taking advantage of Theodosius’ death in January 395, Alaric sacked the Peiraeus (the port of Athens) and destroyed many Greek cities before invading Italy in 401. The western Roman commander-in-chief, Stilicho, repulsed Alaric’s invasion at the battles of Pollentia and Verona in 402. When Stilicho was executed for suspected treason in 408 and the Roman populace assaulted the families of its Gothic garrison in revenge, many of Stilicho’s Gothic federates defected to Alaric. With his army augmented, Alaric invaded Italy again. Alaric went on to besiege Rome three times, 408, 409 and 410, accepting tribute the first time, installing an emperor and accepting a Roman title the second; and sacking it the third time. He planned to establish a Visigoth-ruled Roman province in Africa but his death in 410 precluded that dream. The Visigoths settled as *foederati* in southern France, where they assisted the Roman commander-in-chief Aetius to defeat the Huns at the battle of Châlons in 451. Driven out of Aquitania by the Franks, the Visigoths established a kingdom in Spain in the sixth century, converting to Catholicism. The Spanish Visigothic kingdom fell to the Muslim invasions of the early eighth century.

The eastern Ostrogoths occupied Roman Pannonia, becoming endemic raiders in the Balkans. Little is known of them until they allied with the Huns in the 450s. The Ostrogoths remained with the Huns into the mid-fifth century, but broke from them and established their own kingdom in northern Italy under Theoderic the Great, who became king of the Ostrogoths in 471. Theoderic was commissioned by the eastern Roman emperor Zeno to recover Italy from Odoacer, the Germanic king who had supplanted the last Roman emperor in 476. Theoderic conquered almost the whole of Italy, taking Ravenna as his capital in 493. He also allied with the Visigothic king Alaric II, who married one of his daughters. Upon Alaric II’s death, Theoderic became regent for the Visigothic kingdom in Spain, giving

him power of almost imperial reach. Theoderic's post-Roman kingdom was peaceful and prosperous, but did not long survive his death in 526.

In the early sixth century, the Byzantine emperor Justinian (527–565) attempted to reconquer Italy from the Ostrogoths, an ultimately unsuccessful venture. Many surviving Goths were taken into Byzantine military service. However, the Ostrogoths were then absorbed by the invasion of the Lombards (Langobardi). The Visigothic kingdom lasted into the eighth century, when an Arab army from North Africa landed at Gibraltar in 711 and defeated a Visigoth army. The Arabs then advanced across Spain and entered southern France, extinguishing the Visigothic kingdom in 716.

Gracchan Land Conflict (Second Century BCE)

The second century BCE was a period of crucial transformation in Roman economy and society. The sources present a bleak picture: small farmers driven off the land by the rich, who created large slave-staffed estates to supply the market in Rome. Some elements of this picture are correct: more commercial farms appeared, although this development was mostly limited

to central Italy, catering to the growing city of Rome. It is probable that in this area some small farmers sold their land, because land prices were high. Others may have been forced to leave the land, because population growth caused chronic underemployment in the countryside. In other areas of Italy changes were not so radical, but accumulation of land in the hands of the rich occurred there too. For most small or landless farmers there were other economic opportunities, for example, (seasonal) wage labor, manufacturing, or trade. Furthermore, military service was an attractive option: the wars of the early second century brought in large amounts of wealth. Veterans could also expect land distributions.

However, as the second century progressed, these options became less attractive. The wars fought in the later second century, particularly the Spanish Wars, were less successful, leading to a decline in the willingness of men to enlist. There were also fewer job opportunities in the city of Rome, since after the mid-second century there was a considerable decline in the number of public works. Furthermore, colonization had stopped after the 170s, so that discharged veterans who had lost their land had no means to survive. All this led to an increase in the number of citizens unable to support themselves. Some people moved to the cities, especially Rome, creating an urban proletariat. A situation in which both the rural and the urban poor experienced problems of subsistence presented an ideal opportunity for a social reformer to gain support: now Tiberius Gracchus (163–133 BCE) saw his chance.

The sources state that Tiberius Gracchus identified a lack of access to land as the main problem: since the poor had no land, the people were reluctant to have children, which led to a decline of the number of free citizens and thus a decline in the number of available soldiers. These perceptions were based on a reasonable analysis of available data: the census figures had been falling for 30 years. In the census of 136/135 the number of citizens was lower by 25,000 than in 164/163. There is no evidence that the population actually was declining; the problems described in the sources also fit a situation of overpopulation, though there is extensive scholarly debate over both the interpretation of the census figures and the archaeological evidence. Possibly the declining census figure was caused by a lower willingness of people to register themselves, since those who were not registered could not be called upon to serve in the army. The Spanish Wars were extremely unpopular. However, Gracchus assumed the

population was actually declining.

In the sources, the cause of the problem is described as the occupation of land owned by the Roman state, *ager publicus*, by the rich, although most large estates near Rome were located on private land. However, in the early Republic the struggle for access to land had been presented as a struggle for *ager publicus*. Furthermore, the only land available for distribution was state-owned land. Therefore, Gracchan rhetoric focused on the occupation of *ager publicus* by the rich.

As tribune of the plebs for 133 Tiberius Gracchus proposed a law, the *lex Sempronia agraria*. This limited the possession of *ager publicus* by existing users to a maximum of 500 *iugera*, plus an additional amount for children. All public land above the limit would be distributed to the poor. A three-man commission was installed to execute the proposal.

Many elements of the Gracchan land law are still unclear. A first problem is the limit set on the possession of *ager publicus*. Many scholars assume that the amount was 500 *iugera* (125 hectares) for the occupant and 250 for each of a maximum of two children. However, one of the objectives of the Gracchan reform was to stimulate population growth, which would have been more effective if land had been granted to all children. The limit was imposed on Roman citizens and Latin and Italian allies; legally allies had no right to hold land owned by the Roman state, but it would be dangerous to antagonize Rome's allies. However, allied poor did not receive land from the Gracchan commission. It is often suggested that each settler received thirty *iugera* of land, but there is no evidence for this.

Another issue is whether the distributed land remained *ager publicus* or became private. Sale of the distributed land was forbidden; the plots were also subject to taxation. However, because the main aim of the reform was to increase the number of citizens and soldiers, the plots must have counted in the census as private property, to create new *assidui*.

Obviously the law was opposed by those holding more than 500 *iugera* of public land. The Licinian Law of 367, which had imposed a maximum on holdings of *ager publicus*, had never been enforced; Tiberius was the first who actually proposed to take excess land away from the wealthy. Because Tiberius feared that the senators, many of whom were large landholders themselves, would block him, he took unprecedented steps to ensure his law was passed. Firstly, he sidestepped the Senate and went straight to the *concilium plebis*; normal practice was to ask the Senate's permission before

proposing a law. Another tribune, Octavius, vetoed Tiberius' law. Tiberius then took another unprecedented step: he proposed that Octavius should be deposed. When the people started voting to depose him, Octavius vetoed them; Tiberius had him removed from the meeting and his law was passed.

The Senate tried to hinder the execution of Tiberius' law by giving him insufficient funds to do the job. Tiberius proposed to use the legacy of King Attalus of Pergamum, another unprecedented step. Managing the legacies of client monarchs to Rome was the traditional prerogative of the Senate. Tiberius' opponents declared their intention to prosecute him at the end of his term as tribune. To protect himself, Tiberius attempted to be re-elected as tribune. During the elections, Scipio Nasica and other senators attacked Tiberius and his followers. Tiberius was beaten to death; hundreds of his followers were killed in the riot.

Although Tiberius was dead, the land distributions continued; actually a large amount of land was distributed until 130. In 129, Italian allies complained that lands were taken from them; the jurisdiction to settle claims about which land was state-owned was transferred by the Senate to the consul. However, he ignored his duties, and since most undisputed land had already been distributed, the commission ceased to function.

In 123, Gaius Gracchus (ca. 154–121 BCE), brother of Tiberius, became tribune. Apart from many other measures, he reintroduced his brother's land law, but also proposed to found colonies outside Italy to relieve the pressure on Italian land. Gaius managed to be re-elected as tribune for 122, but the Senate tried to stop him by enlisting tribune Livius Drusus to make even more popular proposals to the people. One of the consuls for 121, Opimius, moved to repeal many of Gaius' measures; violence then broke out. The Senate passed the first *senatus consultum ultimum*, authorizing whatever force was necessary to end the crisis, and besieged Gaius and his followers on the Aventine Hill. The Gracchans were defeated; Gaius committed suicide and 3,000 of his supporters were executed.

The immediate results of the Gracchan reforms were impressive: the land commissioners achieved a great deal within a short time. There are several grids of land distribution (centuriation) from the Gracchan period still visible in the Italian landscape. The total number of new settlers must have been between 15,000 and 50,000. The results of the land distribution of Tiberius Gracchus are visible in the census figure, which in 125/124 was higher by 75,000 compared to 10 years earlier. Firstly, people were more

willing to register, since those registered were eligible for land distributions. Secondly, there was an actual increase in the number of small landholders; now that these people qualified for military service, the state was more eager to register them. Thus, the goals of the Gracchan land reform had been met: the apparent decline of the free population had been halted and the number of available soldiers had increased.

The Gracchan land distributions clearly had a large impact on the Roman state's assets of *ager publicus*. Much land had become private, while previous users of public land had been granted security of tenure on a maximum of 500 *iugera*, plus an amount for children. After the death of Gaius Gracchus, various laws were introduced to change the arrangements. The first allowed recipients of public land to sell the land they had been granted. The second stopped all distributions of state-owned land; those who still held public land were to pay a rent on it to benefit the poor. It also fully privatized all land that had been assigned. The third post-Gracchan law, to be identified with the epigraphic *lex agraria* of 111 BCE, abolished the rent placed on assigned land, so that both new settlers and previous holders of state-owned land held their land as fully private. Thus, these laws were further steps in the privatization process of *ager publicus*.

Despite the increase in the number of citizens, the invasion of the Cimbri and Teutones, and particularly the disaster at Arausio (105 BCE), where (allowing for exaggeration) as many as 80,000 Roman soldiers died, created an immediate demand for recruits that motivated Marius to enlist the *capite censi* (landless poor). The citizen population continued to grow, so that demand for land remained high. This was especially the case after *capite censi* became regular army recruits; these men expected to be provided for after discharge, so that grants of land to veterans became standard practice in the first century. However, there was not enough state-owned land available. In the Marian-Sullan conflict, Sulla therefore resorted to punishing communities that had supported the Marians by taking away their land. The only land still owned by the Roman state was public pasture and some very fertile land in Campania; Caesar finally distributed this in 59 BCE. However, there was simply not enough land available in Italy; from Caesar onward it became standard practice to establish colonies in the provinces.

A further consequence of the Gracchan land reform was growing resentment among the Italian allies. After the Roman conquest of Italy, they

had been allowed to continue to work their land, even if it had been turned into *ager publicus*. The Gracchan laws had treated Italians generously: they were granted private ownership on holdings up to 500 *iugera*, plus an amount for children. However, the surveys carried out by the Gracchan commission were often done incorrectly, which endangered the allies' private property. The land problem came to be connected to the issue of citizenship: in 125 it was proposed for the first time to give the allies citizenship, hoping that they would be more willing to give up their land. In 91, a new attempt was made; the allies hoped that Roman citizenship would protect them against the kind of confiscations they had experienced in the Gracchan period. However, when the proposal to give them citizenship failed, they feared that their land would be taken away and rose in rebellion against the Romans. Thus, the land conflict was one of the main causes of the Social War.

A further long-term consequence of the Gracchan reform was the increasing polarization between *optimates* and *populares*. The Gracchi were the first politicians in recent centuries to use the poor for their own political ends. Later politicians also drew their support especially from the urban plebs. The events of the Gracchan period had shown how *tribuni plebis*, and their unique powers of veto, could be used in politics; politicians increasingly resorted to using tribunes as their agents. The Gracchan conflict also showed how the threat to prosecute a politician after his term of office could be used as a weapon. Finally, the Gracchan conflict was the first time that violence had been used within the city of Rome in recent centuries to settle political differences. Eventually civic violence would become an established part of politics in the first century.

Gratian (Emperor) (367–383 CE)

Flavius Gratianus was a Roman emperor (co-Augustus with Valentinian I and Valens, 367–375; co-emperor with Valens and Valentinian II, 375–378; co-emperor with Valentinian II and Theodosius I, 379–383). Born in 359 at Sirmium, Gratian was the eldest son of Flavius Valentinianus, the future emperor Valentinian I (364–375). When Gratian was eight his father suffered a serious illness and upon recovering presented Gratian to the army as his co-Augustus (Ammianus 27.6.1–16). That Valentinian was forced to

prematurely raise a child to power so soon after making his unpopular brother Valens co-Augustus, demonstrates Valentinian's limited options available in his efforts to stabilize the authority of his dynasty. The designation of sons as co-Augusti (presumed successors) in their minority was not unprecedented, and had been employed by Septimius Severus with Caracalla and Geta.

Following Valentinian's death from a stroke in 375, Gratian was forced to share power in the western empire when a segment of the army raised his even younger half-brother Valentinian II as Augustus (375–392). During his reign Gratian came into conflict with Rome's pagan aristocracy by ending subsidies for pagan ceremonies and priesthoods, refusing the position of *pontifex maximus* (chief pagan priest), and removing the Altar of Victory from the Senate House (Symmachus, *Relationes* 3.15; *Codex Theodosianus* 16.10, 20). In early 379, Gratian appointed Theodosius to replace his uncle Valens as eastern emperor after the latter died at the battle of Adrianople in 378. Throughout his reign Gratian had to contend with a number of ambitious senior commanders who had served under Valentinian I. In 383 a leading general, Magnus Maximus, launched a rebellion in Britain and crossed into Gaul to confront Gratian. After some preliminary skirmishes Gratian's army quickly abandoned him. Compared to the vigorous Magnus Maximus, the young Gratian was considered militarily ineffective by his troops, who also resented him for the favoritism he had shown toward a group of Alan auxiliaries. Gratian subsequently fled and was captured and killed at Lugdunum (Zosimus 4.35–36).

Great Trajanic Frieze

The Great Trajanic Frieze is a historical relief commemorating the Dacian Wars (101–106 CE), probably originally exhibited in the Forum of Trajan, now part of the Arch of Constantine. The original extent and location of the Great Trajanic Frieze is debated by scholars; it may have featured as the entablature of a colonnade in the library court of the Forum of Trajan. The Great Trajanic Frieze is unusually large and of fine workmanship, depicting not separate scenes as on the Column of Trajan, but a continuous scene. The frieze features the emperor Trajan as mounted warrior in heroic fashion; Roman soldiers with Dacian captives; and the emperor's triumphal entrance into the city of Rome, attended by the goddesses Victoria and Roma.

Constantine the Great (306–337) created the Arch of Constantine to commemorate his defeat of his rival Maxentius in 312 CE, decorating it with reliefs removed from older monuments, including the Great Trajanic Frieze. Such “recycling” of architectural elements was common in late antiquity and was not regarded as inappropriate.

Hadrian (Emperor) (117–138 CE)

One of the “Five Good Emperors,” Hadrian (Publius Aelius Hadrianus, 117–138 CE) was notable for his promotion of a “peacetime” army, his apparent conflict with the Senate, his extensive travels, his brutal crushing of the Bar Kochba Revolt of 132–135, and his securing the succession of Antoninus Pius (138–161) and Marcus Aurelius (161–180).

Landowners in Italica, Spain, Hadrian’s forefathers were provincial Roman citizens who had entered the Roman Senate a few generations ago. Hadrian was born in 76. In 95 and 96, Hadrian served as laticlavian tribune, a typical officership for a young man of senatorial status. It was unusual, however, of Hadrian to hold this rank twice.

In 96, the emperor Domitian (81–96) was overthrown and assassinated by a palace conspiracy, destabilizing the empire. The Senate supported their own choice, the elderly Marcus Cocceius Nerva. The praetorians were angry because they had been loyal to Domitian, who had raised military pay across the board. In October 97, the praetorians mutinied against Nerva, who conceded to them by handing over Domitian’s assassins. Nerva was clearly unable to control the situation. Nerva declared that he was adopting Trajan (Marcus Ulpius Traianus), at that time governor of Pannonia (or, as some argue, Upper Germany), who had won a decisive victory over the Germans. No one knew for sure whether Trajan had forced Nerva’s hand. Nerva died on January 27, 98 and Trajan was declared emperor on January 28. Hadrian, who was serving a third tribuneship in Upper Germany, brought the news to Trajan at Cologne.

Hadrian was marked out as a recipient of Trajan’s favor, a potential successor, though Trajan was still relatively young and did not then declare

a successor. Hadrian married Trajan's grand-niece Sabina. Hadrian was admitted to the Senate and held the junior magistracy of imperial quaestor, with fiscal responsibilities. When Trajan waged his First Dacian War (101–102), Hadrian accompanied him. Hadrian's next offices were tribune of the plebs (104) and praetor (105), but he also served in the Second Dacian War (105–106) and was promoted to legate of Legio I Minervia. According to the *Historia Augusta*, Hadrian received military decorations for distinction in the Dacian Wars, but again little detail is known. Hadrian was also rewarded with a consulship in 108.

Hadrian next became an officer in Trajan's Parthian War, in which the Romans captured the Persian capital of Ctesiphon and acquired three new provinces, Assyria, Greater Armenia, and Mesopotamia. The new conquests left instability in their wake. Revolts broke out in Mesopotamia; in reprisal, Trajan's generals destroyed Seleucia on the Tigris and Edessa in Syria. Jewish revolts occurred in Cyrenaica and Egypt and were likewise suppressed harshly. Birley (1997) emphasizes that though Hadrian is considered a "peacetime" emperor, he was trained in war and became acquainted with Roman mercilessness toward provincial unrest.

In 117, Trajan fell ill, possibly from a stroke, and died at Selinus on August 10. Hadrian was acclaimed emperor on August 11, 117. His designation as Trajan's heir was probably unsurprising, but according to rumor, Trajan had been incapacitated and Trajan's wife the empress Plotina had designated Hadrian. The Senate had not been consulted. Hadrian's position as emperor was secure neither at Rome nor in the provinces, especially in the precarious eastern empire.

As emperor, Hadrian acted immediately, abandoning Trajan's new provinces of Assyria, Mesopotamia, and Greater Armenia. He returned to the middle Empire through the Balkans, also relinquishing part of Moesia around the Danube delta, turning these areas over to the Sarmatian Roxolani. Hadrian's other decisive action was apparently to order the deaths of four senior senators, acting through his praetorian prefect Attianus to save his own reputation. Whether these four men were actually guilty of any conspiracies is uncertain; one of them, Avidius Nigrinus, allegedly planned to assassinate Hadrian (Dio 69.2.5; *Historia Augusta, Hadrian* 7.1). Hadrian then dismissed Attianus and swore to the Senate that he would not execute another senator without their vote (Dio 69.2.6; *Historia Augusta, Hadrian* 7.4). However, the damage had been done. The Senate regarded

Hadrian with suspicion, and for his part, Hadrian frequently spent long periods away from Rome.

Hadrian undertook no new campaigns, but maintained and improved the Roman army, apparently developing the concept of a “peacetime” army along the Roman saying “if you wish peace, prepare for war” (cf. *Historia Augusta, Hadrian* 10.2). The frontier bases were stationary by this time. Hadrian visited them on his travels, addressing his soldiers and examining all aspects of military administration and discipline. He enjoyed camaraderie with his men, dressing and eating in the manner of a common soldier. He expelled officers’ civilian luxuries from camps. He repressed corruption, and he regulated the conditions of service to exclude men who were too young or too old for military service. A Latin inscription at Lambaesis in Numidia preserves a speech of Hadrian’s to the troops, given in 128 (*ILS* 2487; 9133–9135). Hadrian praises and criticizes the troops’ performance of military exercises, including cavalry formations, displaying the notable knowledge of military affairs that literary authors credit him with. Legal sources also show that Hadrian administered the legal affairs of soldiers, who, as stationary personnel, amassed both property and relationships with civilians (including their *de facto* wives, mothers of their children).

Hadrian’s most notable military policy was the building of linear frontier works, Hadrian’s Wall in north Britain being only the most famous. In the early 120s, he supported construction of a palisade between the River Main and the River Neckar on the eastern border of Upper Germany and Raetia. A line of forts had been begun by Domitian. In north Britain in 122, Hadrian initiated the building of a frontier wall from the mouth of the Solway in the west to the mouth of the Tyne in the east. This isthmus was a practical dividing line. In 122, probably only a bridge at the mouth of the Tyne, termed the Pons Aelius after Hadrian, and a dedicatory inscription (*Roman Inscriptions of Britain* 1051) were finished; the entirety of Hadrian’s Wall would take many years to finish. Contemporaries believed that the walls were intended to “keep out” the barbarians, but in practice the Roman army allowed traders and herding peoples to pass across the frontiers in both directions and exacted customs duties.

Though he paid great attention to the army, Hadrian’s travels around the empire had a wider aim: to make the emperor more visible to the empire. Such travels were not unprecedented. Provincial governors were

expected to tour their provinces, visiting major cities and holding assizes. But Hadrian ensured that his provincial subjects knew who he was and in theory found him accessible. This discouraged usurpation by local would-be emperors. A story is told of Hadrian, though it is attributed to Hellenistic rulers too. An old woman accosted Hadrian with a petition, asking him to resolve a legal problem. "I don't have time," Hadrian said. The old woman retorted, "Then cease to rule!" (Dio 69.6.3; cf. Plutarch, *Demetrius* 42).

A highly cultivated man, Hadrian was passionate about Greek culture and, in his travels, spent time in Athens and the Greek cities of Asia Minor. This philhellenism led to two episodes that overshadowed the later years of his reign. In Asia Minor in the 120s, Hadrian brought into his entourage a Bithynian youth named Antinous. Hadrian and Antinous were probably lovers in the classical Greek manner in which an older man loved a younger man (in his late teens) for a short time. To prolong the relationship into the younger partner's adulthood was considered disgraceful. In 130, Hadrian traveled to Egypt, accompanied by Antinous. Antinous drowned in the River Nile, apparently a suicide. Antinous' motivation is unknown; A. R. Birley (1997) has suggested possibly shame that he was becoming too old for an appropriate relationship, or a *devotio*, a self-sacrifice to obtain the favor of a god, perhaps for Hadrian's health. In any case, Hadrian was grief-stricken and had Antinous deified, naming a new Egyptian city Antinoöpolis in his honor. Though the Romans were not hostile to same-sex sexual practices *per se*, imitating the Greek model of homosexual love was considered un-Roman.

The second episode was the Jewish revolt of 132–135, called the Bar Kochba Revolt after its leader, Simon Bar Kochba. Though the Jews already had good cause to hate the Romans, Hadrian's policies triggered the revolt: Hadrian decided to found a new Roman city, Aelia Capitolina, on the site of Jerusalem, and allegedly to ban circumcision (Dio 69.12.1–2). The new city was named for Capitoline Jupiter, the chief Roman god, fundamentally offending the Jews. Hadrian came to Judaea briefly to oversee the suppression of the revolt, but otherwise left the task to his generals. The Romans slew, according to Dio, 585,000 Jews (Dio 69.13.3) and sold many more into slavery. No further significant Jewish revolts occurred down to the end of the empire, but whenever they recorded it, Jewish rabbis execrated Hadrian's name.

Hadrian's marriage to Sabina was allegedly hostile and produced no

children. By the mid-130s Hadrian was in ill health and faced the need to choose an adoptive successor, continuing the adoptive succession policy begun by Nerva and Trajan. Hadrian's first choice was Lucius Ceionius Commodus, who was adopted as Lucius Aelius Caesar in 136. The sickly Aelius died early in 138, and Hadrian chose another adoptive successor, Aurelius Antoninus (the future emperor Antoninus Pius), a man in his 50s, and required Antoninus to adopt the teenage Marcus Annianus Verus, the future emperor Marcus Aurelius. Such a double adoption ensured the succession of the imperial power for many years.

Unfortunately, Hadrian's bad relationship with the Senate re-emerged when he allegedly forced his elderly relative Servianus and Servianus' grandson Fuscus to commit suicide. The implication of Servianus and Fuscus in a conspiracy is unclear, and the suicides added to Hadrian's reputation for cruelty to senators. The claims that Hadrian died "hated by everyone" (*Historia Augusta, Hadrian* 25.6–7; Dio 69.23.2) reflect the senatorial perspective. Nonetheless, Hadrian had secured the succession. When Hadrian himself died, probably of heart disease, in 138, he was succeeded smoothly by Antoninus Pius.

The main historical sources for Hadrian's life and reign are Cassius Dio's *Roman History*, book 69 (surviving as Byzantine-era summaries) and the *Historia Augusta's Vita Hadriani*. Extensive documentary sources help fill out the life of one of the most remarkable Roman emperors.

Hadrian's Wall

Hadrian's Wall was built in the 120s CE across the Tyne-Solway isthmus in northern Britain (between modern Newcastle and Carlisle and extending to each coast). The wall was ca. 15 feet high, 6–10 feet thick at its foundation, and stretched for 80 Roman miles. It was complemented with 17 forts, 81 milecastles (small fortlet structures), and 158 turrets (watch towers). Every Roman mile along the entire length of the wall stood the milecastles with gates to the north and south as well as the forts with at least one entry point on every side. To the north of the wall stood a defensive ditch, with a single v-notch profile and to the south the so-called *vallum*, a large earthwork ditch with mounds on either side. The presence of the *vallum* suggests that there were security concerns on both sides of the Wall, not only with unconquered tribes to the north.

The Wall was originally of stone construction from Newcastle-upon-Tyne (soon extended east to Wallsend) to the River Irthing, with turf construction on the western end to the coast. The project was part of Hadrian's policy to halt expansion of the empire and give permanent boundaries to the frontiers. Fronto (*De Bello Parthico* 2) refers to the death of soldiers in Britain under Hadrian, and the *Historia Augusta* (*Hadrian* 5.1–2) reports troubles in Britain around the beginning of Hadrian's reign (117 CE), a situation which may explain the undertaking of this massive project. A coin issue of between 119 and 125 CE portraying *Britannia* suggests some form of military victory in Britain. The single surviving reference to Hadrian's Wall in Roman literature reports that the wall was built to separate the Romans from the barbarians (*Historia Augusta, Hadrian* 11.2). The wall was not intended to be an entirely closed boundary and should not be envisioned as a barrier to keep northern peoples out of the Roman Empire. The wall should be seen more as an imperial control point for asserting hegemony over the area and for controlling movement around the frontier zone. Various units of auxiliary soldiers (nonlegionary units) garrisoned the forts, milecastles and, turrets, allowing the Roman army to monitor the movements of natives, control small attacks and raiding, and quickly alert larger units to any more serious threats.

Hannibal Barca (247–183 BCE)

Hannibal Barca was the Carthaginian general who launched the Second Punic War (218–201 BCE) against the Roman Republic. His brilliantly executed tactics on the battlefield won him resounding victories and earned him a reputation, both during the ancient world and the present, as one of history's best commanders and tacticians.

Hannibal, born in Carthage in 247 BCE, was the eldest son of the First Punic War commander, Hamilcar Barca (Barca, the family nickname, meaning "lightning"). Before leaving for Carthaginian Spain with Hamilcar, nine-year old Hannibal swore eternal hatred for the Romans in a religious ritual performed at the insistence of his father.

During his time in Spain (237–218 BCE), Hannibal studied with tutors and received martial training. He married Imilce, a Spanish princess from Castulo, and had a son around the year 220 BCE. It is generally accepted that Imilce did not join her husband on his invasion of Italy and their son either died young or lived in obscurity.

In 221 BCE, Hamilcar died and was succeeded by his son-in-law, Hasdrubal, who then founded New Carthage in Spain. Later that year, Hasdrubal was assassinated by a Gaul who may have been aided by Hannibal himself. Hannibal became the commander of the Carthaginian army in Spain; his close physical resemblance to his father made the transition of leadership a relatively smooth one.

Hannibal must have been a charismatic and impressive figure. His multiethnic, multilingual army—made up of Carthaginians, Libyans, Iberians, Celtiberians, Lusitanians, Gauls, Ligurians, Greeks, Numidians, Balearic slingers, and Italians—never mutinied regardless of the hardships they endured for the 15 years they fought in Italy. Hannibal led by example,

which no doubt endeared him to his soldiers; his firm control over such an army and the superior maneuvers they achieved bespoke of exceptional leadership.

Hannibal aimed to humble the Roman Republic by dismantling its network of alliances with peoples throughout Italy, the core of Roman supplies and reinforcements. After capturing the Roman-allied Spanish town of Saguntum in 218 BCE, Hannibal left his younger brother, Hasdrubal Barca, in charge of Spain, and led his army north. In the meantime, the Romans declared war on Carthage after the Punic Senate refused to curtail Hannibal's ambitions.

Hannibal's land invasion of Roman Italy became a thing of legend. In November of 218 BCE, the Carthaginians crossed the Pyrenees, overcame the Romans in a small skirmish at the Rhône River, and then pressed onward to the snow-covered Alps. The epic 15-day excursion across the Alpine crags was a risky one; the steep, icy climbs and hostile native tribes cost Hannibal thousands of men, many supplies, and most of his war elephants.

The overconfident Romans awaited Hannibal at the foot of the Alps but were soundly defeated at their first major engagement at the Trebia River. Familiar with Roman military tactics, Hannibal took advantage of his army's flexibility and the Roman legions' inflexibility, outflanking and killing 15,000–20,000 Romans. Hannibal moved south, initiating a "scorched earth" policy that illustrated Roman powerlessness and drew Italian peoples to his side. He assured them that their farms would be spared if they deserted Rome. To prove his good intentions, Hannibal regularly released his non-Roman prisoners of war.

It is said that Hannibal contracted ophthalmia and became blind in his right eye as the Carthaginians passed through the marshes of Etruria, yet he and his men successfully ambushed the next Roman army sent against them despite his disability. Harnessing their tactical superiority again, the Carthaginian army routed the Roman legions at the battle of Lake Trasimene (June 217 BCE), killing 15,000 Romans and capturing 10,000 more.

The Romans appreciated the danger they were in and revived the emergency office of dictator. Dictator Quintus Fabius Maximus acknowledged that the legions did not fare well in pitched battles against Hannibal and so he initiated a delaying strategy where his army shadowed the enemy from high ground, periodically ambush them to prevent them from foraging, and refuse to fight battles. Fabius' plan would starve

Hannibal into submission.

The Romans, however, criticized the dictator for what they considered cowardly tactics, but what they did not know was that Hannibal recognized the danger he was in; his army could not survive without local supplies and reinforcements. The Carthaginians ravaged the Italian countryside, hoping to anger the Romans enough to abandon their war of attrition and fight a pitched battle.

The plan worked. In 216 BCE, the Romans mustered the largest army in the Republic's history and in August met Hannibal outside the town of Cannae. It was here that Hannibal illustrated his tactical brilliance and won his most famous battle.

The Romans lined up in standard formation, light and heavy infantries in the center and cavalries on the flanks. Hannibal's light infantry was placed in the center, the heavier infantry on the flanks, and the entire army was positioned in a concave shape pointing toward the Roman legions. As Hannibal anticipated, the Carthaginian light infantry, made up of undisciplined Gallic and Spanish troops, fell back under the onslaught of the powerful Roman charge, transforming the concave Punic line into a convex one. As the Roman infantry pushed forward, the Carthaginian heavy infantry, made up of more professionalized soldiers, slowly closed in on the legions' sides. Rome's cavalries, more suited for pursuit or scouting missions, were quickly chased away by Hannibal's experienced horsemen. When the Carthaginian cavalry returned, they took up position in the Roman rear. The Roman legions were completely surrounded and a massacre ensued. Though 10,000 Romans survived—the heavy infantry in the center managed to break through the Carthaginian line—approximately 50,000 Romans and allies were killed, including a Roman general.

Such a conclusive victory usually ended wars in the ancient world. Indeed, Hannibal sent envoys with his prisoners to Rome to discuss terms and Philip V of Macedon struck up an alliance with Hannibal in 215 BCE as a preventative measure to maintain the weakened state of the Roman Republic. Hannibal's plan of breaking Rome's hegemony was working; news spread of Cannae's outcome and many territories loyal to Rome defected. By 212 BCE, most of Campania and 40 percent of Rome's allies abandoned the Republic, with Etruria and Umbria deliberating to do so.

Hannibal traveled virtually unopposed through central and southern Italy, foraging supplies, persuading and besieging Italian peoples to abandon

Rome, and engaging in small encounters with the Romans. Though Hannibal remained undefeated on the field, he could not counter all of the Republic's persistent comebacks. Rome's determination to fight until the very end allowed them to gradually regain all previous territories and alliances, thereby providing them with seemingly inexhaustible reinforcements. By 205 BCE, the tides had turned in favor of Rome: Carthaginian Spain had been subdued; Campania and Syracuse were back under Roman control; Hasdrubal Barca was killed at the battle of the Metaurus River in 207 BCE before he could join Hannibal; and the potential threat of Philip V of Macedon was neutralized. The Romans' comeback was so successful that they launched an invasion of Africa in 205 BCE.

Spearheading the invasion was Scipio Africanus. Having learned from his experiences at the battle of Cannae, Scipio created a semiprofessional army worthy of the hardened Carthaginians. As the Romans successfully fought their way toward Carthage, the Carthaginian Senate recalled Hannibal in 203 BCE. Fully equipped with a fresh army and 80 elephants, Hannibal faced Scipio at the battle of Zama in 202 BCE. Hannibal was defeated and the Second Punic War was over.

Hannibal survived Zama and advocated peace with Rome. His time in Italy, however, left a deep scar on the Roman psyche. By 196 BCE, there were rumors that Hannibal was advising the Republic's enemies. The Romans believed they were not safe as long as Hannibal lived and from then on, the Carthaginian was a hunted man, fleeing to Syria, Crete, Armenia, Tyre, and lastly to Libyssa in Bithynia. Before the Romans secured his capture, Hannibal committed suicide in 183 BCE. According to Plutarch, he lamented: "Let us now put an end to the great anxiety of the Romans, who have thought it too long and hard a task to wait for the death of a hated old man..."

Hannibal Barca may have lost to the Romans in the end but his brilliant tactics and generalship have inspired later generals to create their own Cannaes. None have come close. A charming anecdote tells of Scipio and Hannibal meeting in Ephesus later in life. Scipio asked his old foe who he thought were history's three greatest generals. Hannibal, listing them in order of importance, replied, "Alexander, Pyrrhus, and myself." Scipio, surprised, inquired who the three greatest generals would be if Scipio did *not* defeat him. Hannibal answered the same three men but his own name would be at the top of the list.

Hasdrubal (Active 150s–140s BCE)

Hasdrubal was the commander of the Carthaginians during the Third Punic War (149–146 BCE); he was also the Carthaginian general who campaigned in 151 BCE against the Numidians, who had been raiding Carthaginian territory for several years. Since Rome had forbidden Carthage to go to war, this gave the Romans a pretext to punish the Carthaginians, declaring the Third Punic War. The Carthaginians disciplined Hasdrubal for causing Roman interference but reinstated him upon realizing that a Roman attack was imminent. The Third Punic War lasted three years until Publius

Cornelius Scipio Aemilianus in 146 took and destroyed Carthage. Polybius 38.7–8's depiction of Hasdrubal treats him harshly. The longest narrative is in Appian's *Punic Wars*, most importantly at 70–118.

Hasdrubal Barca (245–207 BCE)

Hasdrubal Barca was a Carthaginian commander who spent most of his military career campaigning in Spain in Second Punic War (218–201). He belonged to the aristocratic Barcid family and was the son of Hamilcar Barca and younger brother to the more illustrious Hannibal Barca.

When Hannibal made preparations to depart from Spain to Italy (218) he left Hasdrubal in charge of a sizeable army and navy there. Hannibal's intention was to probably use Hasdrubal as back up for his invasion of Italy. However, the Romans had different ideas and Hasdrubal was to be involved in several major confrontations particularly against Gnaeus and Publius Cornelius Scipio. At Cissa (near mod. Tarragona) in 218 he failed to arrive in time to help the Carthaginian army, under Hanno, thus allowing the Romans to secure their hold north and south of the River Ebro. In 217, he was defeated by Gnaeus and forced to retreat after the battle of the River Ebro. He lost again at Dertosa (mod. Tortosa) in 215. However, Hasdrubal showed his mettle as a commander when he defeated both Scipio brothers, who were killed, in 211 near the River Baetis (mod. Guadalquivir). In 209/208, Hasdrubal met his match in Scipio Africanus at the battle of Baecula (mod. Bailén). The defeat forced Hasdrubal and his depleted army to retreat across the Pyrenees with the aim of joining Hannibal in Italy. However, in 207, Hasdrubal was beheaded by the Romans at the battle of Metaurus (mod. River Metauro, north Italy).

Hasdrubal will always be remembered in the shadow of his older

brother, Hannibal. But he was a capable commander having evaded the Romans for several years. He played a major, if ultimately unsuccessful, role in the Second Punic War.

Hastati

The *hastati* were a rank in the manipular army of the classical Roman Republic (ca. 340–170 BCE). They were the youngest group of men alongside the other infantry ranks, the *principes*, and the *triarii*. There were 10 maniples of 120 *hastati* in a legion, totaling 1,200 at full strength. In battle, the *hastati* deployed as the front line of the three fold battle line or *triplex acies*, the middle rank being the *principes* and the third rank the *triarii*. The *velites* (skirmishers) ranged ahead of the army.

The name of the *hastati* is derived from the *hasta* or spear, though they were probably armed with two *pila*, or heavy javelins rather than a thrusting spear. They were also armed with a large oval shield (the *scutum*), helmet, greaves, breastplate, and a sword. They disappeared with the reorganization of the manipular legion into cohorts, in which all soldiers were equipped the same way.

Helvidius Priscus (d. ca. 75 CE)

Helvidius Priscus was a senator whose philosophically based opposition to the Flavian emperors led to his exile and execution. He was the son-in-law of Thrasea Paetus, a senator and philosophical opponent of the Principate who committed political suicide in the reign of Nero. Priscus was tribune of the plebs in 56 and praetor in 70. He was exiled after Paetus' death. Vespasian (69–79) permitted Priscus to return from exile, but Priscus became critical of the emperor and was eventually exiled (ca. 75) and executed.

Heretics and Polytheists, Persecution of

Christian persecution of variant forms of Christianity has been a major force in shaping western civilization since the beginning of the early Church. The Christian movement was never fully unified, and it took over three centuries to develop the dominant catholic (“universal”) or orthodox (“right-thinking”) form of Christianity. Heresy is a chosen belief that deviates from what would become established orthodoxy. Modern scholarship appreciates plurality in ancient Christianity (or “Christianities”)

without privileging proto-orthodox belief, thus many scholars eschew the term “heresy” in favor of less loaded terms like “heterodoxy.” Heterodox beliefs were not necessarily inauthentic or biblically incorrect, and they were not necessarily minority movements: The greatest heresy of the fourth century was the Arian interpretation of the Trinity, and it may have been a majority opinion with years of enthusiastic support from emperors and bishops until the anti-Arian side ultimately won. The complicated *theological* debate on such matters will not be discussed in this article. However, one must realize that even though some of these doctrinal disputes seem hopelessly subtle to us today, they were of real interest to a truly broad range of people who thought getting these questions right was absolutely vital. The following material focuses on the Christian state’s involvement in religious conflicts, including (by way of brief conclusion) the repression of Jews and pagans.

The persecution of schismatic Christian groups is a related concern. Whereas heresy is deviation in belief, a schism is an institutional fracture. Like heresy, schism was a threat to the Church from its beginning (note, for example, Paul’s competitive hostility toward his rivals). Persecution of Christianity aggravated institutional divides, especially the “Great” persecution undertaken by Diocletian and the Tetrarchs in the early 300s. These persecutions were severe enough to cause a later crisis over how to bring back into the fold Christians who had been weak under persecution. Two rigorist sects emerged, the Donatists in North Africa and the Melitians in Egypt, which tenaciously rejected anything done by weak Christians (or their associates) who had handed over the scriptures to Roman persecutors, or otherwise compromised the faith. Donatism proved to be the more difficult schism, claiming legitimacy as the “true church of the martyrs” and gaining a large following in what is today Algeria and Tunisia.

Constantine’s conversion to Christianity, and his unrivaled grasp on the western Roman Empire, in 312 utterly changed how heresy and schism were handled. Before, Christian communities addressed schisms and heresies themselves internally, by means of regional conferences of local Christian leaders (bishops), the exchange of letters between communities, and the early development of creeds (public declarations of faith). But after 312, Christianity now gained an imperial-triumphalist aspect it had hitherto lacked, and the possibility of state persecution was realized. Constantine seemed convinced that division within Christendom would undermine his

rule. He heard appeals from Donatists and Catholics alike and sided with the latter. Initially, Constantine followed the recent example of the pagan Tetrarchs and persecuted and killed recalcitrant Donatists. If anything, this type of martyrdom strengthened the Donatist cause, and Constantine soon ceased the executions of unyielding Donatists. Henceforth, exile of leaders became the emperors' main tool for dealing with schismatic and heretical leaders. Constantine and his successors also built churches for Christians and gave valuable privileges and exemptions to Catholic clergy only, denying heretics and schismatics such gifts.

Constantine took over the whole empire in 324, and in the next year convened the first empire-wide "ecumenical" church council at Nicaea. The convened bishops had to determine when all Christians would celebrate Easter, as a concern of institutional unity. More pressing was the Arian debate on the Trinity. A key anti-Arian theologian was Athanasius of Alexandria, and while he was victorious at Nicaea, his later fortunes show the vicissitudes of the emperors' whim. Shortly after Nicaea, Constantine started wavering after listening to pro-Arian advisors. Some of his fourth-century successors were Arian, favoring councils that mitigated the attempted unity of Nicaea. Athanasius was exiled from Alexandria several times. The Arian emperor Valens' stunning defeat at the battle of Adrianople in 378 was probably seen as divine repudiation of Arianism, which thenceforth faded within the Roman Empire. The problem of back-and-forth councils and imperial whim continued though. The Christological controversies of the fifth century featured "robber" councils and counter-councils which sometimes became violent. Intercity rivalry among the empire's metropolises (especially Rome, Carthage, Constantinople, Alexandria) was a background factor behind the religious disputes of the era as well.

Regionalism, changing imperial policy, and continued institutional disputes also inflamed tensions over schism. In 347, under Constantine's sons, North Africa saw a brutal imperial repression of Donatism, called the Macarian Persecution; not only was there renewed violence against prominent Donatists, there was at least one wholesale slaughter of a Donatist congregation. Catholics authorities confiscated Donatist churches, and may have been on the verge of stamping out Donatism. Then, in 361, Constantine's pagan nephew Julian "the Apostate" took the throne. Julian barred Christians from the teaching profession and canceled privileges that

had accrued to Christian bishops, such as free use of the imperial transport system (*cursus publicus*). But the main way Julian hurt the Church was by refusing to referee Christians' endless disputes, reasoning that "no savage beasts are so menacing as most Christians are to one another" (Ammianus 22.5.4). Julian allowed all exiled bishops to return home, which led to tumult and violence with Donatists retaking their churches and congregations. Catholic gains in North Africa vanished and the Donatist schism entered a more violent phase with fanatics called circumcellions pressing the Donatist cause. Donatism continued losing favor, though, at the imperial level and in church councils, which gave Catholicism decisive practical advantages. Information is scarce after Augustine's death and the Vandal conquest of Africa in 430, but Donatism may have limped on in some form till the Arab conquest of the mid-seventh century.

The Christianization of the Roman Empire was a tangible misfortune to Jews and pagans alike. Constantine ended pagan blood sacrifice, and by the end of the fourth century Christianity was the official state religion. Theodosius I (379–395) and other Christian emperors commanded their praetorian prefects to confiscate non-Catholic altars and coerced practitioners of pagan rites with threats of torture and death; Christians who apostatized to paganism were stripped of the right to make a legal will or testify in court. Judaism was not outlawed or persecuted as a religion, yet imperial legislation of the fourth through sixth centuries made economic and social life harder for Jews. Heretics, pagans, and Jews were sometimes lumped together in being denied privileges and protection, and these disfavored populations became the targets of mob violence. State persecution of these groups was more passive than active: when mobs lynched pagans or heretics, or burned synagogues, the imperial authorities generally did nothing to stop or punish the violence. Such attacks were sometimes led by clergy. Even if an emperor wanted to stem such disorder, popular opposition and the growing strength of bishops like Ambrose of Milan (d. 397) might prevent him.

Christian persecution of heretics, schismatics, and non-Christians forms a dark chapter in history that continued to play out well into modern times. Conflicts in late antiquity shaped church-state relations for centuries to come, and generated creeds still recited by millions of Christians at weekly services. Despite the lamentable oppression of this legacy, rightly rejected by free societies today, the basic unity of Christendom for a thousand years

is a signal achievement that should not go unrecognized.

Herodian (d. 240 CE)

Herodian was a Greek historian of the early third century CE, who wrote a *History of the Empire after Marcus* in eight books, covering the period from Commodus (180–192) to the Gordians (ending in 238). Herodian sometimes provides a more detailed account of events than Cassius Dio's abridgement by the Byzantine Xiphilinus. Though rhetorical, Herodian is also more reliable than the *Historia Augusta*, a collection of Latin biographies of emperors from Hadrian (117–138) through Numerian (283–284) that declines sharply in quality after the Life of Macrinus (217–218).

Herodian provides an unflattering account of the reign of Alexander Severus (222–235), a young emperor who was a pawn of the Severans' dynastic strife and who was eventually murdered by his mutinous soldiers. With little basis in fact, the *Historia Augusta's* *Life of Alexander* presents Alexander Severus as the ideal emperor.

Herodian also provides some insight into conflict in the beginning of the third century crisis (235–284), though he blames the indiscipline and greed

of the Roman army. He describes the events of 235–238, marked by the revolts of Maximinus, a soldier-emperor, and the Gordians, senatorial aristocrats.

Historia Augusta

The *Historia Augusta*, also known as *Scriptores Historiae Augustae* (e.g., in the three-volume Loeb Classical Library edition), is a collection of imperial biographies from the Emperor Hadrian (117–138 CE) to Carinus and Numerian (283–284), including unsuccessful usurpers. The authorship and date of the *Historia Augusta* (abbreviated HA) are uncertain, and the work is unreliable particularly for usurpers and for the third-century emperors after Macrinus (217–218). Nonetheless the *Historia Augusta* is an important historiographic source.

The alleged authors are supposedly writing in the reigns of Diocletian (284–305) and Constantine (306–337), occasionally addressing these emperors in asides. However, the purported authors are otherwise unknown and modern scholars have proposed that the real author(s) wrote nearly a century later, in the late fourth or early fifth centuries CE, based on various anachronisms and possible allusions. Nothing is known of this author or authors except that they were clearly familiar with the conventions of Latin historiography and biography, sometimes parodying these conventions.

The earlier lives of the *Historia Augusta*, from Hadrian to Macrinus, are relatively substantial and probably derive from the no longer extant work of

Marius Maximus; they can be compared with Cassius Dio and Herodian. For the period conventionally termed the third-century crisis (235–284), other literary sources, such as the epitomes by Eutropius and Aurelius Victor and later chronicles, are very abbreviated, and the *Historia Augusta* gives the fullest though unreliable source. Where possible, the *Historia Augusta* can be compared with these sources and with the fragments of the contemporary Greek author Dexippus (preserved in later sources) and with contemporary coins and documents.

The real author(s) of the *Historia Augusta* include fantastic or absurd elements, especially in the so-called *Secondary Vitae* or biographers of pretenders or usurpers, such as Avidius Cassius (in the reign of Marcus Aurelius, 161–180 CE) and Pescennius Niger (early in the reign of Septimius Severus, 193–211 CE) and the so-called *Thirty Tyrants* of the mid-third century. The elements of the absurd are also frequent in the biographies of Heliogabalus (218–222) and Alexander Severus (222–235) and all subsequent biographies (Loeb *SHA* vol. III). The *Secondary Vitae* and later *Lives* also contains extensive incidental and probably invented detail.

Nonetheless, even comical or digressive anecdotes in the *Historia Augusta* are of use because they reveal Roman social and cultural attitudes. Military discipline was a favorite theme of the author(s), for instance appearing in the biography of Hadrian and dominating the biographies of Avidius Cassius and Pescennius Niger. The *Historia Augusta* is also a valuable source of imperial ideology, presenting models of good and bad rulers. The *Historia Augusta*'s Commodus, Caracalla, and Heliogabalus are extremely bad emperors and (with very little historical basis) the *Historia Augusta*'s Alexander Severus is the ideal emperor. With the exception of Gallienus, a bad emperor, the military emperors of the third-century crisis period (Claudius II Gothicus through Probus) are given heroic virtues.

Honorius (Emperor) (395–423 CE)

Honorius, son of Theodosius I, ruled the western Roman Empire from 395 to 423 CE. Born in 384, Honorius became emperor at the age of 11. He was at first dominated by his guardian, the *magister utriusque militiae* (commander-in-chief) Stilicho. Honorius was married to Maria, Stilicho's daughter. Stilicho balanced an array of threats, including Alaric and his marauding Visigoths, new barbarian movements across the frontier, and intrigues in Milan and in Constantinople. After Alaric's failed invasion of Italy in 402, Honorius and Stilicho moved the western Roman capital to Ravenna, a more defensible location than Milan.

In 407, the Rhine froze over, and a barbarian alliance swept into northern Gaul. In the same year, the usurper Constantine III crossed the Channel into Gaul. At the same time, in 408, the eastern emperor, Arcadius, had died and Stilicho traveled to Constantinople, allegedly hoping to influence the court of Theodosius II, Arcadius' young heir (born 402). With Stilicho away, Honorius came under the influence of Olympius, who led Roman troops in a revolt against Stilicho and his barbarian troops. Honorius executed Stilicho in 408. Stilicho's death allowed a resurgent Alaric to sack Rome in 410. The sack of Rome was traumatic for the Roman world.

As several new usurpers emerged in Hispania and Gaul, Honorius found a new general in Constantius (Emperor Constantius III, 421). Constantius defeated the usurper Constantine in 411. Constantius allied with the Visigoths, settling them in Aquitaine and used them to defeat the other barbarian foes. He also fought off a usurper on the Rhine and one in Africa. Constantius married Honorius' sister, Galla Placidia, and fathered Honorius' heir, Valentinian III (born 421). Constantius III reigned briefly, but Galla Placidia became the power behind the throne for both Honorius and Valentinian III, Honorius dying in 423 and Valentinian reigning from 425 to 455.

Horace (65–8 BCE)

Quintus Horatius Flaccus was one of the most famous Latin poets closely associated with the Augustan period. He is not a direct literary source for the civil wars, but some of his works reflect Augustan ideology.

Horace's father was of low birth (a freedman) but provided his son with an elite education at Rome. Horace himself served in Marcus Junius Brutus' army as a tribune. After the battles of Philippi, Horace relinquished military life and worked as a scribe (a civilian assistant to the magistrates). He began a literary career around this time, finding a patron in Maecenas, Augustus' ally. Though his work depicts the Augustan peace favorably, Horace did not seek Augustus as a direct patron and retired to private life.

In Horace's body of work, *Epodes* 1 and 9 and *Odes* 1.37 allude to the battle of Actium. *Odes* 3.1–6 and 3.24 allude to the Augustan moral legislation. Horace's *Carmen Saeculare* is Horace's most overtly "Augustan" work.

Hostages

Modern hostage-taking is a violent practice, in which armies, terrorists, or criminal gangs or pirates usually extort ransom for their victims or merely kill them to inflict terror. As such, hostage taking is now condemned in international law. In antiquity, the exchange of hostages was a routine element of diplomacy. Hostage exchange could be presented as hospitality, overlapping with the Mediterranean-wide practice of guest-friendship, in which the host and guest had mutual obligations of good conduct. Mistreatment of guest-friends and hostages was traditionally regarded as sacrilegious, and the assassination of hostages might be a pretext for war.

In early Rome, the Romans exchanged hostages with their Italian allies. However, by the second century BCE it was already apparent that Rome had the upper hand in her relationships with other peoples and states. Even as the Romans employed the language of guest-friendship to remonstrate with Greek and Hellenistic states, this language veiled coercion (e.g., Livy 42.39–41). The Greek historian Polybius of Megalopolis was effectively a hostage for the Achaean League, even though he also became a friend of Lucius Aemilius Paullus (the victor of the Third Macedonian War) and his son Scipio Aemilianus.

The inequality in hostage-taking was sharper when the hostages were neither Italian nor Greek but “barbarian” peoples. Typically, the Romans would accept native leaders’ children as hostages and give them a classical education at Rome. Such a practice underlined the power difference in the relationship, the children being dependent on their hosts. A classical education instilled Greco-Roman culture and values, and the children would also develop personal ties with their hosts, making the children, when they grew up, more likely to cooperate with Rome. Rome thus adopted the role of a “parent” to barbarian peoples, illustrated on the reliefs of the *Ara Pacis* where barbarian children accompany the procession of members of the Julio-Claudian house. However, the adult hostages could not always be relied on for loyalty.

Hostage exchange also occurred during civil conflicts and wars. Less formal exchanges might be used to confirm alliances. In the Tetrarchy, the

sons of Constantius I and Maximian, Constantine and Maxentius, were educated at the court of Diocletian (284–305) where they were in effect hostages for their fathers' loyalty. Marriages might play the same role as hostage exchange. In the Treaty of Brundisium (40 BCE), Octavia, the sister of Octavian, was married to Mark Antony and thus became in effect a hostage. In the Tetrarchy, Diocletian's daughter Valeria was married to his Caesar Galerius.

Hostage-taking as a violent mode of extortion was practiced by pirates and brigands. During his early post in Asia Minor, the young Julius Caesar was captured by pirates and held for ransom. Promising them ransom, he persuaded them to release him, then returned with Roman soldiers and arrested them.

Human Sacrifice

Human sacrifice appears in Greek and Roman mythology, and may have occurred in the prehistoric era. By the historical period it was considered mostly a past practice, and some rituals have been suspected of being symbolic replacements of an earlier practice of human sacrifice. The *pontifices*, Vestal Virgins and others tossed straw effigies called *Argei* into the Tiber from the *Pons Sublicius* (Livy 1.21.5), an act which some ancient authors suspected of substituting for an earlier human sacrifice. In relation to war, human sacrifice is attested in two major ways; self-sacrifice, in Latin the practice called *devotio*; and the sacrifice of humans to the gods in times of extreme crisis. In the former, a willing participant gave up his life to ensure victory for his side, most famously in the stories of the Decii clan, whose father, son, and grandson each dedicated their lives to the gods of the

underworld in exchange for victory (see article “Decius Mus, Publius”).

The second category of human sacrifices during war is those recorded to have happened on occasions of great emergency. During the Persian Wars, the Athenian general Themistocles is said to have allowed three Persian noblemen, nephews of King Xerxes, to be sacrificed to Dionysus Omestes (“the flesh eater”). During the third and second centuries BCE, on three separate occasions (228, 216, and 114/113 BCE) the Romans sacrificed two Gauls, male and female, and two Greeks, male and female, by burying them alive in the *Forum Boarium* (Plutarch, *Marcellus* 3.3–4, *Moralia* 284a–284c; Livy 22.57.3–6). Livy calls such acts “repellent to Roman sentiment.” These sacrifices are not fully understood, particularly the choice of nationalities, which represent nations with which the Romans were not at war. In each case the sacrifice seems connected to a scandal involving the Vestal Virgins. According to Pliny the Elder, human sacrifice was officially banned outright in 97 BCE (Pliny *Natural History* 30.3.12).

The practice of human sacrifice came to be shorthand for moral depravity, symbolizing the barbarity of Rome’s enemies—the Carthaginians were thought to sacrifice infants, and Caesar wrote of the Celtic practice of human sacrifice, including a ritual in which victims were burned alive inside the effigy of a man made of wicker (Caesar, *Gallic Wars* 6.16). Roman soldiers were made victims to the practice when German tribes sacrificed military tribunes on their altars in 9 CE during the devastating Roman loss at the Teutoburg forest (Tacitus, *Annals* 1.61). The trope of human sacrifice was also used to characterize Rome’s internal enemies, such as in the likely embellished accounts of the conspirator and enemy of the state Catiline (Lucius Sergius Catilina), which assert that he executed Marcus Marius Gratidianus (Marius’ nephew) at the tomb of the Lutatii, an action evocative of human sacrifice (Valerius Maximus 9.2.1). Similarly, Christian apologists of the second century CE recorded accusations of sacrifices and cannibalism, and in particular the story that neophytes were initiated into the religion by means of rite in which they struck a baby concealed in flour, whose blood and limbs were then consumed by those present (Minucius Felix *Octavius* 9.5). This so-called blood libel had the longest history of the use of human sacrifice as a dehumanizing trope.

Huns

The Huns were a confederation of mounted warrior bands that alternately threatened the later Roman Empire as well as defended it from other barbarian invaders in the fourth and fifth centuries CE. The Huns originated in Central Eurasia, possibly to the north of China prior to the second century. They first appear in Mediterranean historical sources in the late fourth century, when they defeated Gothic kingdoms located north of the Black Sea and the Danube River—generating waves of Gothic refugees who fled south and threatened the Roman Empire.

The Huns initially served as Roman clients, providing auxiliary forces to serve Rome. Hunnic forces consisted of cavalry primarily armed with a powerful composite bow; their secondary weapons consisted of swords and lassoes. The Huns developed proficiency in siege warfare, and their armies evolved to incorporate subordinate allies, including infantry, using their own traditional weapons. Hun warriors were supplied with spare horses that allowed them to rapidly cover great distances.

Although bands of Huns may have attacked the Roman Empire as early as 378, their first major assault on Roman territory occurred in 395, when raiding bands crossed the Danube into Thrace. Simultaneously, to the east of the Black Sea, Huns crossed the Caucasus Mountains and, due to an absence of many Roman military units which had been deployed elsewhere, rapidly advanced through Armenia to Syria and Cilicia, seizing cattle and enslaving Romans, before retreating across the Caucasus Mountains. When the Romans went to war with the Persians in the 420s, the Romans stripped their northern frontier of resources, allowing the Huns to once again attack Thrace.

In 445, Attila became the sole king of the Huns and inaugurated the period of the Huns' greatest political and military prowess. Attila's policy toward Rome alternated raids with peace treaties, during which he acquired huge amounts of gold as well as Roman territory to incorporate in his burgeoning, though short-lived Hunnic Empire. Attila launched two major assaults on the western Roman Empire: a march into Gaul which was thwarted in 451 at the battle of Châlons by an alliance between Rome, the Goths, and other barbarians; and an attack on Italy in 452, which failed due to disease and logistical difficulties. Following Attila's death in 453, his empire was divided among his sons and Hunnic power began to rapidly unravel. This was hastened by the revolt of Germanic peoples against the Huns, culminating in a series of battles that broke Hunnic hegemony in about 455. In subsequent years, the Huns progressively declined as a credible threat to Rome, though bands of Huns continued to serve as mercenaries in Roman service in Italy in 457 and Sicily in 461.

I

Idistaviso, Battle of (16 CE)

In the battle of Idistaviso, also termed the battle of the Weser River, Germanicus defeated the German leader Arminius and destroyed his army. A former Roman auxiliary, Arminius had defected to the Germans and become a native leader. To expedite invasion, Germanicus employed naval transport, assembling his forces at the island of the Batavi. He commanded auxiliary troops (themselves Gauls and Rhinelanders), four legions, two cohorts of praetorians, and units of archers and slingers. The Roman invasion penetrated the area between the rivers Amisia (Ems) and Visurgis (Weser).

The Romans first deployed Batavian cavalry against the Germans; the Batavian cavalry were expert at swimming and fording waterways, but were beaten back by the Germans. The battle took place on the Weser (Visurgis) in a plain termed Idistaviso, where the Germans occupied the plain and kept a reserve force in the forest. To deter the German assault, the Romans built earthworks to force the enemy to attack uphill. The Romans overwhelmed the Germans, but many escaped, including Arminius.

Subsequently, the Germans attempted to ambush the Romans on the march. This time neither side had an escape route, the Germans being hemmed in by a wood, the Romans by the river and hills. The Germans were too closely crowded to wield their weapons effectively or sustain a charge, favoring Roman tactics. The Romans slaughtered all of the Germans (though Arminius escaped a second time) and Germanicus erected a trophy in honor of the emperor Tiberius. The return of his army was hindered by a storm that wrecked many ships. Germanicus was recalled by Tiberius and permitted to celebrate a triumph. The battle of Idistaviso was considered to

have avenged the Varian disaster of 9 CE. The episode of Idistaviso is narrated by Tacitus, *Annals* 2.5–26.

Ilerda, Battle of (49 BCE)

The battle of Ilerda took place in 49 BCE between the forces of Gaius Julius Caesar and those of the Pompeian politicians Lucius Afranius and Marcus Petreius, near the town of Ilerda in Spain. It was one of the earlier conflicts in Caesar's civil war against the Pompeians, who were led by Gnaeus Pompey. Unlike other many other battles of the time, this battle served more as a campaign maneuver rather than an attempt to weaken the enemy's military strength.

Near the town of Ilerda, there was a plain, in the middle of which there was a hill. This hill controlled communication to and from the town, and it also had a weapons store. Capturing the hill was Caesar's main objective; if the Caesareans were to hold it, they could effectively cut off supplies and communication to the Pompeians. The opposing forces secured the hill first. Nevertheless, Caesar's soldiers engaged their enemies in an attempt to take the hill from them. This contest led to a longer and larger battle.

The first engagement was unique for Roman warfare at the time because of the style of fighting that the Pompeian soldiers had adopted in their fight against the Caesareans. According to Caesar, who is our primary source for the battle, the Pompeian legionaries were fighting with skirmish-like tactics, presumably appropriated from the local Spanish style of fighting. This means that the Pompeian soldiers were approaching the Caesareans and then running away from them in what seemed like disorder. The Caesareans were surprised by this approach because they had expected the Pompeians,

being Romans, to fight in the same manner as they did, that is with disciplined maneuvering and a strict adherence to their positioning—dictated by the ensigns or battle standards.

Because of the unexpected method of the Pompeian attack, the Caesarean soldiers were driven back, but after retreating to safety, they renewed their attack with reinforcements. Caesar then claims that in an effort to compensate for retreating, the reinforced legions charged the Pompeians with particular vigor and enthusiasm, managing to push them back a significant distance, very near to the town of Ilerda itself; this, in turn, found them fighting on the hill leading to Ilerda.

Once on the hill, the Caesareans were chasing the Pompeian forces uphill, and upon realizing that they were in an advantageous position, the latter army turned and attacked the Caesareans. Because of the steepness of the sides of the hill, the forces engaged in combat could not be reinforced from the flanks, and so their respective commanders sent reinforcements to their rear—the Pompeian soldiers having to go through the town to join their comrades.

Caesar claims that the battle lasted five hours in such circumstances, until his forces finally made a powerful push against the enemy, forcing them to retreat to the town. He further claims that his losses were significantly fewer than those of his enemies. If this is true, the victory is especially notable because of the adverse combat conditions that his soldiers were faced with (first, facing skirmishing tactics, then fighting a literal uphill battle).

The victory did not immediately lead to consequential gains in Spain for Caesar's forces. Ilerda should be considered as part of Caesar's overall campaign, in which he outmaneuvered the forces of Afranius and Petreius, forcing the latter into a waterless area where they ran short of provisions. He was able to negotiate their surrender to the Caesarian side, thus achieving a "bloodless" victory (emphasized in Caesar's *Civil War*) and seven additional legions.

Illyria

Ancient Illyria comprised parts of modern-day Croatia, Bosnia and Herzegovina, Montenegro, and Albania. The territory was inhabited by several peoples of Illyrian or Pannonian origin, most notably the coastal Liburni and Delmatae, who were renowned for their seafaring abilities. Although the Illyrians had been engaged in trade with the Greeks since the seventh century BCE, their first contact with the Romans occurred in 230 BCE, when a group of Illyrian pirates attacked Italian merchants. This event initiated the First Illyrian War, fought between Rome and the Illyrian kingdom (229–228 BCE). After the First Illyrian War, Illyria became a Roman client state. The Illyrian kingdom finally fell in 168 BCE, at which point Illyria came under the jurisdiction of the Romans. This was not, however, the end of Roman-Illyrian conflict. The Delmatae's protest about encroachment on their territory set in motion a series of further Roman campaigns between the years 158–135 BCE. In general, the Romans considered Illyria to be of little threat, and these campaigns were conducted mainly for the purposes of training an army or seeking glory. Definitive Roman control over Illyria, however, was established following the Augustan campaigns of 35–33 BCE and 13–9 BCE (*Pannonian Wars*); and 6–9 CE (Pannonian revolt), after which the Roman provinces of Dalmatia and Pannonia came into existence.

Imperator

Throughout the Roman period, the title *imperator* denoted military authority and evidenced martial expertise. With the advent of the Principate, *imperator* became one of the emperor's titles and closely bound up with imperial power.

During the republican era, victorious troops would bestow the title *imperator* upon a successful general through public acclamation. Tradition indicates that this may have taken place on the battlefield itself (Pliny the Younger, *Panegyricus* 12.1). Though Scipio Africanus was allegedly hailed as *imperator*, the first attested general to be hailed as *imperator* was Lucius Aemilius Paullus in 189 BCE. Generals were permitted to retain the title of *imperator* until they re-entered the city of Rome for their triumph, although on occasion the Senate could also permit a general to utilize the title on the day of his triumph.

The title of *imperator* took on a more significant meaning during the violence of the late Republic and establishment of the Principate. Augustus recognized the value of the title for emphasizing his preeminent military authority. In a radical shift in tradition, Augustus utilized *Imperator* as a *praenomen*, ensuring that his name (*Imperator Caesar Augustus*) was permanently linked to military command. While the title of *imperator* continued to be bestowed upon members of the imperial family, it persisted in a permanent form in the name of the emperor himself. Augustus' successors did not necessarily follow Augustus' model. Both Tiberius and Claudius publicly refused to take the *praenomen imperatoris* (Suetonius, *Tiberius* 26.2, *Claudius* 12.1). The chaos of the civil wars of 69 CE prompted subsequent emperors, starting with Vespasian (69–79 CE), to adopt the *praenomen imperatoris* on a regular basis, thus distinguishing themselves as supreme military commanders.

Under the early Principate, acclamations as *imperator* increasingly became the preserve of the imperial family. The final acclamation of an individual outside of the imperial family was that of Junius Blaesus in 22 CE. Emperors came to accept the title of *imperator* on behalf of the successful generals who fought under their command. The title was charged with political meaning, to the extent that Augustus could deprive Drusus of an acclamation by the troops (Dio 54.33.5).

It is likely that most emperors dated their first acclamation as *imperator*

to their accession, so that number of time an emperor was acclaimed as *imperator* was often abbreviated in his titles and coins to signify the year of his reign. It has been conjectured that imperial acclamations were also used to designate potential heirs, particularly during the Julio-Claudian period (Tacitus *Annals* 1.3). The number of acclamations accepted by particular emperors varied according to the nature of their reigns. It is noteworthy that, of the Julio-Claudian emperors, Claudius received the most acclamations (Campbell 1984: 124). This may reflect his lack of military credibility and his desire to demonstrate that he held the political allegiance of the praetorians and provincial armies.

The title of *imperator* was thus imbued with significant political power as a symbol of victory and of imperial rule. Its significance in terms of battlefield exploits became increasingly irrelevant. Yet this did not detract from its symbolic currency as evidence of the close relationship between the emperor and his soldiers. This latter function demonstrates why the title of *imperator* was jealously monopolized by the emperor and his close male relatives. If you were a nonimperial general or even private citizen who was saluted as *imperator*, you had revolted from the incumbent emperor, which is why some emperors elevated by their soldiers attempted at first to refuse the title.

Imperial Titles

The titles of the Roman emperors are attested in inscriptions, edicts, and other documentary sources, and tended to grow longer and longer over the centuries. The core element was *Imperator Caesar Augustus*, adopted by Augustus (27 BCE–14 CE), to which filiation, numerous offices, and honorifics

could be added. The imperial titles packed a great deal of ideology into a relatively short space, as especially on coins, and also on inscriptions, imperial titles received standard abbreviations. After Augustus, the Julio-Claudian emperors did not take the *praenomen Imperator*, but it is a standard element of imperial titulature from Vespasian onward.

Filiation indicated the relationship of the present emperor to his immediate predecessor. Augustus was *divi filius*, son of the deified (Julius Caesar), and many subsequent emperors were also deified after their deaths. Though adopted by Nerva, Trajan was officially *divi Nervae filius*, “son of the deified Nerva.”

The emperor’s formal titles included *pontifex maximus*, chief priest of the state religion; holder of the tribunician power (for the *n*th time); and *imperator* (for the *n*th time), distinct from the praenomen *Imperator*. The consulship (for the *n*th time) might also be included. These formal titles indicated the offices and powers held by the emperor, dating from the Augustan settlements.

Honorific titles included *pater patriae* (“Father of the Fatherland,” adopted by Augustus), *pius* (“faithful”), and *felix* (“fortunate”). Other honorific titles alluded to the emperor’s conquests, which were attributed to him even if he did not campaign in person. *Britannicus* or “Conqueror of Britain,” *Germanicus* or “Conqueror of Germany,” and *Parthicus* or “Conqueror of Persia” were possible triumphal titles, to which *maximus* was often added, particularly by the late second century CE onward. Thus Caracalla was *Parthicus Maximus* and *Britannicus Maximus*, associating himself with his father’s conquests. In Severus’ reign, Caracalla had been nominal Augustus (co-emperor with Severus). The later emperor might also be termed *invictus* (“unconquerable”). The military role of the emperor as symbolic conqueror was thus stressed.

In the later Empire, *Dominus noster* (“Our Lord”) tended to supplant *Imperator* as the first element, usually abbreviated to *D(ominus) N(oster)* in inscriptions. Abstract titles such as *Aeternitas* (“Your Eternity”) or *Serenitas* (“Your Serenity”) also became frequently used, especially in noninscriptionary documentary sources such as imperial edicts and communications.

Imperialism

Like most English words ending in “-ism,” imperialism is a modern term, although it has broad conceptual parallels across the span of human civilization. Its semantic root is the Latin term *imperium*, “the power to command.” Imperialism can be simply defined as the behavior by which a powerful state exerts control over less powerful states.

Modern political theorists use the term imperialism to cover a wide range of state activities and behaviors. If “empire,” as Michael Doyle defines it, is “a system of interaction between two political entities, one of which, the dominant metropole, exerts political control over the internal and external policy—the effective sovereignty—of the other, the subordinate periphery” (Doyle 1986: 12), then imperialism is the pursuit by a metropole of this type of control. Empire may be informal (that is, sustained by collaborators on the periphery rather than by a resident metropolitan military and bureaucracy), but must be distinguished from hegemony (when a metropole seeks to control, by formal or informal means, another state’s foreign policy only).

Most structural theories of imperialism can be categorized as either metrocentric, pericentric, or systemic. Metrocentric theory regards imperialism exclusively as a function of “dispositional” factors within metropolitan society (a particularly warlike aristocracy, the need for excess capital at home to find new outlets for investment abroad). Pericentric theory argues that troubles on the periphery, such as disputes between imperial collaborators and resisters, and consequent threats to metropolitan investments, draw imperial powers reluctantly into expensive and potentially bloody armed interventions to protect those investments (the

flag, as it were, follows trade, not the other way round). Systemic theory (also called Realist theory) posits a transcendent international system generated by the limitations of human reactions to security threats. In the absence of a credible international referee (a state of anarchy, literally “leaderlessness”), this system compels all states to behave in broadly similar ways, resulting in a ruthless global environment in which “the state among states ... conducts its affairs in the brooding shadow of violence. Because some states may at any time use force, all states must be prepared to do so—or live at the mercy of their militarily more vigorous neighbors” (Waltz 1979: 102). All states, therefore, engage in security-seeking behavior, resulting, over time, in only one or a few metropolitan imperial powers controlling the destiny of a host of lesser states.
